AN UGLY GIRL.

(Continued from page 430.)

CHAPTER XXXI.

THE INTERVIEW WITH THE HEIRESS.

"I am sorry to have distressed you by my violence, Miss Gray," said Noel, earnestly. "I ought not to have given way to it. I ought to have remembered that it could do no good. However, I will relieve you of my presence, only asking you to believe that I shall always retain a grateful sense of your kindness to me during my illness."

"Did I not owe you my life?" she murmured. But this he would not hear. Her distrust had wounded him so deeply that he could scarcely forbear reproaching her more vehemently than before. To think that she could imagine him guilty of such deliberate meanness was more than he could endure with patience, and to know that he owed all this to Clement Dunforth, the plausible scoundrel, who, under the guise of friendship, had robbed him of her good opinion, galled him almost to madness.

But he restrained himself, and, bowing with cold politeness, quitted the room. Carisforde was now so detestable to him, that he was impatient to depart. He still thought of its mistress with commiseration, but his pity was mingled with scorn of the weakness that had rendered both her and Hillian the easy dupes of a scoundrel; and he could not rest till he had written the fullest details of the affair to Mr. Blenkinsop, and urged him to hasten home and take his ward under his guardianship.

This done, he dismissed Jephson, having first arranged to leave the Park by an earlier train than he had first decided on; but in two or three minutes Jephson returned, to say that Miss Carisforde would like to see him before he went, and would be in the library at eleven the following morning, if that hour would suit him.

In his present mood, Noel felt very much disposed to decline the interview; yet to do so might be looked upon as a token that he feared to encounter his accusers, and, therefore, sent word that he would defer his journey so as to wait upon his kinswoman at the hour appointed.

At last, her reserve was conquered. At last, he and Ada Carisforde would meet face to face Could he help feeling a little excited when he knew this?

* * * * * * *

And now the morning dawned on which Noel proposed to quit Carisforde Park for ever. Few though the weeks had been since he first set foot within the noble mansion which he then expected to call his own, he seemed to have gone through years of suffering and sorrow; for he had not only learned to love, but been brought to acknowledge that he had made a sad mistake in bestowing his affections on one who had not valued the gift.

How bitterly he felt towards Clement Dunforth it is not easy to describe. He could have forgiven him for discovering that Hillian Gray was fitter to be his wife than the heedless Irene; but he could not pardon the deliberate cruelty with which he had trifled with two young creatures solely to make his way by their means into the good graces of a richer woman.

Herr Rudolsheim came in to bid him adieu while he was idling over the breakfast, for which he had no appetite.

"But we shall meet again," the Herr said, briskly; "for I shall visit London when I have finished my work here; and then if you are still in the humor to expatriate yourself, why not go with me to my own country? At Hamburg I have friends who are in communication with many of the English colonies, and one or other of them shall most assuredly be able to further your views."

Noel gratefully thanked him, mentally acknowledging that he would rather be indebted to this frank, genial foreigner than to his own countryman; they parted; the German going to inspect some old manuscripts in the possession of a gentleman in the neighborhood, and Noel proceeding to the library, where he was informed that Miss Carisforde would join him.

He met Mrs. Hurst on the way, and was detained for a considerable time to listen to her voluble regrets at losing him—her hopes that he would take care of himself, and attend to all the rules for his health which Dr. Monson had laid down—and that he would not suffer himself to be persuaded to go into any very hot country, lest he should have sunstroke, nor into very cold ones, as it would grieve her extremely to hear of his being frozen to death, or, what would be almost as bad, returning home minus his fingers and toes—a misfortune which, as she had been credibly informed, many travellers had met with, "even to the nose, which must be so dreadfully awkward, you know," especially where that feature was such a nice-shaped feature as Lord Carisforde's.

With much difficulty he succeeded in extracting himself from the hands of his loquacious friend, whom he could not shake off abruptly after seeing that tears—genuine tears—were in her eyes. Mrs. Hurst had not been insensible to the patient good humor and courtesy with which he had always treated her, and she ran after him to the door of the library to beg that he would wear the knitted vests of her own making, which he would find amongst his luggage.

But at last she left him, and, with his pulses quickening a little, he turned the handle of the door and entered the library. Miss Carisforde was not there; but at the expiration of a minute or two, a full-length oil painting, that hung opposite the table on which the jewel cabinet had once been placed, swung aside, and then he saw that it concealed a door in the oaken paneling, which now slowly opened.

But it was Hillian Gray, in her simple black dress—with her hair brushed back from the white brows, on which he could have sworn that candor and innocence sat enthroned—who entered, and, after a moment's hesitation, advanced to greet him.

A suspicion of the truth began to break upon Noel, but he did not speak. If he had been tricked in every way, let the lips of this inscrutable girl avow it unasked; he would neither prompt her to the confession, nor assist her in making it.

But Hillian had watched his expressive face too often not to guess the reason why it suddenly clouded and his attitude became more hostile; and, raising her own slight figure to its fullest hight, she addressed him:

"I see, my lord, that you guess my secret at last, and that you think it is time that you knew me by my rightful name, Ada Hillian Carisforde."

"Pardon me, Miss Carisforde," he retorted, coldly, "if I tell you that you have not interpreted my thoughts rightly. If I permitted them to dwell at all upon a lady's caprices, it has not been to marvel why she has concealed her name so long, but why she divulges it to me now."

This was cruel, and Hillian winced; but she did not hesitate to defend herself.

"My lord, I did not deliberately assume the alias under which you have known me. Recall, if you please, the events of your arrival here."

"Is it worth while to trouble you to enter on a long explanation?" Noel interposed. "Every one of those events of which you remind me does but prove that from the first moment of my coming to this house I have been distrusted and—*duped*. I do not know why you have granted me this interview, unless it is to triumph over the gullibility which I have displayed."

Hillian crimsoned, then grew deadly pale. She scarcely dared to look at her incensed cousin; but when one furtive glance had shown her that he was as much agitated as herself, she took courage to make another attempt to exculpate herself.

"I tell you again, my lord, that I have never made a deliberate attempt to deceive you. Taught from my earliest childhood to consider myself so repulsive in appearance, that I must never hope to associate with other girls of my age, and compelled to see that my dying father, even while he accepted my attentions, could scarcely endure my presence—can you wonder that I shrank from any intercourse with you and your step-mother?"

Noel did not answer, but she saw that he was listening. She had gained his ear, and this encouraged her to proceed.

"You will remember, I dare say, that when my presence was requested at the reading of my father's will, I begged to be excused. From words that he had let fall during his illness, I had gathered enough to divine that his bequests were couched in some extraordinary manner, and felt that the task of listening while Mr. Whitely read them would be a painful one, for which my grief and the fatigue I had gone through had quite unfitted me."

"It was not pressed unkindly upon you, Miss Carisforde," she was reminded.

"True, and my proposal was agreed to that Miss Gray, the maiden sister of Mrs. Hurst—who had been with us during the last few days of papa's life—should act as my substitute; but when I spoke to her she positively and, as I then thought, rather harshly refused to take my place. It was my duty, she said, to go and learn the last wishes of my dear father; and reluctantly I obeyed."

"But I conclude that she did not bid you assume her name."

"Neither did I," was the reply. "But when I entered the room, trembling and alone, afraid to glance at my unknown relatives lest I should detect the loathing with which I expected them to regard me, Mr. Whitley addressed me as Miss Gray. Before I could explain to him that he was under a mistake, Mrs. Estcourt objected to the presence of a dependent in such a manner that I did not care to undeceive her just then: there would be time enough to do so when I could retreat at once from the lady with whom I felt no desire to improve my acquaintance."

Hillian, whose tone had become a resentful one, here checked herself, and in a more moderate one begged Noel to excuse her if she had spoken with some indignation.

"Miss Gray and Mrs. Hurst," she added, "are the sisters of my dead mother. Their love, their care, was all I knew in my childhood; they are still my best, because my most faithful, friends, and I cannot permit either of them to be considered mere dependents."

Noel would not give an opinion on the act she was defending, and, impatient at the silence that seemed to condemn her, she went on, rapidly:

"The will was read, and you, my lord, expressed your determination never to—to agree to the terms of it in such a manner, that to say to you, 'I am the Ada Carisforde for whom you are neither expressing sympathy nor consideration,' would have been impossible."

"I expressed my resolve too hastily; I acknowledge it," said Noel. "The dread of appearing mercenary, or of giving encouragement to the hopes I knew Mrs. Estcourt would entertain, made me forget all else. Whatever sounded ungenerous in my speech I have long since regretted, and I hope you will pardon it."

Hillian Carisforde partially extended her hand, but drew it back when her kinsman showed no disposition to clasp it, and contented herself with bowing slightly.

"I have a few more words to say, if I may detain you a little longer," she told him. "I should like you to understand why the mystification has been allowed to continue. Grieved that my father, in his love for me, should have inflicted any injury on you, I made the resolution to renounce all claims to the property, and follow Miss Gray, who had left Carisforde that evening, and persuade her to take me abroad. How my flight was prevented by the storm and the subsequent fall of the tower, you know. I could not go away while the life of my preserver was in danger, I preferred to let him know me still under the name of Hillian, for while he regarded me as merely the niece of Mrs. Hurst, I knew my presence would not disturb him. If I have learned to think that to our friendship"—and now her voice began to falter—"has been a mistake, the fault is not mine."

"Nor mine," said Noel, curtly.

"Indeed, and yet——" Hillian began.

But he would not let her proceed any farther.

"And yet, as you have already hinted, you have been taught to doubt me, to think that while I lay here a helpless invalid I employed myself in plotting and contriving mischief. In your readiness to distrust me, you do not appear to have asked yourself—for what end?—what benefit could I derive, or what injury inflict on you by such conduct? It would only have been prudent as well as kind to put these questions to yourself before you so utterly condemned me."

"I have asked myself these questions repeatedly," Miss Carisforde murmured, "and could find no answer to them except—— But no, my lord—no; in that at least I have done you justice. No one shall ever induce me to believe that it has been to carry out a paltry scheme of revenge that you have striven to humiliate me."

"Then this is one of the accusations brought against me? But no matter; I will not question you. Perhaps the solitary, friendless life you have lived is some excuse for your readiness to think the worst of others."

"Spare me your pity. If I have erred, I am sufficiently punished," said Hillian, in low tones

And as she turned away, Noel heard her sob. He took a step nearer, for her distress had softened him.

"Miss Carisforde, it would be folly for me to pretend that I am satisfied with the usage I have received at your hands. You have shown yourself in two characters—the gentle, generous woman, whom neither slanderous imputation nor more direct assertions have ever brought me to doubt, and the coldly suspicious one who has watched over me—not kindly, as I imagined, but to detect in me some excuse for the distrust she has suffered herself to be taught to cherish. To the Hillian whose tears have been shed for my sufferings, I would fain say a cousinly adieu; but to the Ada Carisforde, the kinswoman between whom and myself her suspicions have erected a stronger barrier than her father's will, I have nothing to say but that she has my good wishes."

He bowed low, and was leaving her—Heaven only knew at what a cost to himself!—when her uplifted hand arrested him.

"Answer me but one question ere you depart. Why did you bring Clement Dunforth here? He was not—he is not—your friend, even though he may be mine. Why did you employ him to drag to light those follies I would have had forgotten?"

"I have done neither of these things!" her pleading look constrained Noel to assure her. "By no previous arrangement with me did he come here; and he, if there is any truth in him, can tell you that I should never have known that there was a secret in your life, or that you had borne another name, if he had not recognized you."

She started.

"Then in this at least he has not deceived me. You have known all along that I was your cousin, and your pretence of ignorance has been cleverly assumed. Oh! shame on you, Noel Carisforde!—shame on you to cheat me thus—to lure me on, and profess the most noble sentiments that you might obtain the greater influence over me! Nay, I will hear no more! It wrings my heart to know that you are like the rest of the world—false—false! Why did you not take this hateful property when I first offered it to you, and let me hide myself from you forever?"

She ran out of the room, and Noel, alternately grieved and angry, rang for the carriage to be brought to the door, in which he was to be driven to the station. It seemed cruel to leave her in this state of mind, yet to argue, to remonstrate with a woman who confessed that she had lost all faith in him, was a task to which he could not stoop, especially as it was no longer Hillian the poor, but Ada the wealthy, to whom he must address himself.

Yet how dearly he still loved her! how hard it was to think that the machinations of a scoundrel should have made her so unlike her gentle, generous self! Was there no way of unmasking Clement Dunforth?

Apparently none; but ere Noel left the house he wrote a few lines to Mrs. Hurst, entreating her, in the most urgent terms he could employ, to watch carefully over Miss Carisforde until her guardian could arrive and relieve her of the responsibility.

This done, with a heavy heart he bade adieu to Carisforde Park. He had come thither full of hope for the future; he was going away with every hope blighted forever.—[To be continued.

CONTENTMENT.

MISS S. A. C.

I've sought for contentment in various ways,
To cheer me in life's path along,
But now I will seek it the rest of my days,
Where contentment alone can belong.

'Tis not in the gilded haunts of the great,
Nor in costly palaces strong,
Nor in vigils keeping, long and late,
Where pleasure tempts the throng.

But away from the busy cares of life,
Surrounded by friends that I love,
I'll fly from all fretful, eager strife
And a lesson learn from the dove.

ORIGIN OF TWO POPULAR POEMS.

Hood's touching lyric, "The Song of the Shirt," was the work of an evening. Its author was prompted to write it by the condition of thousands of working-women in the city of London. The effect of its production was foreseen by two persons, the poet's wife and Mark Lemon, the editor of *Punch*.

"Now mind, Tom—mind my words," said his devoted wife; "this will tell wonderfully. It is one of the best things you ever did."

Mr. Lemon, looking over his letters one morning, opened an envelope, inclosing a poem which the writer said had been rejected by three London journals. He begged the editor to consign it to the waste-paper basket, if it was not thought suitable for *Punch*, as the author was "sick of the sight of it." The poem was signed Tom Hood, and was entitled "The Song of the Shirt."

It was submitted to the weekly meeting of the editors and principal contributors, several of whom opposed its publication as unsuitable to the pages of a comic journal. Mr. Lemon, however, was so firmly impressed with its beauty that he published it on December 16, 1843.

"The Song of the Shirt" trebled the sale of the paper and created a profound sensation throughout Great Britain. People of every class were moved by it. It was chanted by ballad singers in the streets of London, and drew tears from the eyes of Princes. Some years after the author's death the English people erected a monument over his grave. The rich gave guineas, the laborers and sewing women gave shillings and pence. Sculptured on it is the inscription devised by himself: "He sang 'The Song of the Shirt.'"

"The Old Oaken Bucket" was written fifty or more years ago by a printer named Samuel Woodworth. He was in the habit of dropping into a noted drinking saloon kept by one Mallory. One day, after drinking a glass of brandy and water, he smacked his lips and declared that Mallory's brandy was superior to any drink he had ever tasted.

"No," said Mallory, "you are mistaken. There was a drink which in both our estimations far surpassed this."

"What was that?" incredulously asked Woodworth.

"The fresh spring water we used to drink from the old oaken bucket that hung in the well, after returning from the fields on a sultry day."

"Very true," replied Woodworth, tear-drops glistening in his eyes.

Returning to his printing office, he seated himself at his desk and began to write. In half an hour

"The old oaken bucket, the iron-bound bucket,
The moss-covered bucket which hung in the well,"

was embalmed in an inspiring song that has become as familiar as a household word.—*Burlington Hawkeye.*

THE CAMEL.

Mr. Palgrave, criticising the reputation that the animal has for docility, remarks: "If docile means stupid, well and good; in such a case the camel is the very model of docility. But if the epithet is intended to designate an animal that takes an interest in its rider so far as a beast can; that in some way understands his intentions, or shares them in a subordinate fashion; that obeys from a sort of submissive or half fellow-feeling with his master, like a horse or elephant; then I say that the camel is by no means docile—very much the contrary. He takes no heed of his rider, pays no attention whether he be on his back or not, walks straight on when once set a-going, merely because he is too stupid to turn aside; and then, should some tempting thorn or green branch allure him out of the path, continues to walk on in the new direction, simply because he is too dull to turn back into the right road. In a word, he is, from first to last, an undomesticated and savage animal rendered serviceable by stupidity alone without much skill on his master's part, or any co-operation on his own, save that of an extreme passive-

ness. Neither attachment nor even habit impresses him; never tame, though not wide awake enough to be exactly wild."

Nevertheless, the animal gives indications of intelligence when badly treated, if we may judge from its revengeful nature, well illustrated in the following account: "A valuable camel, working in an oil-mill, was severely beaten by the driver. Perceiving that the camel had treasured up the injury, and was only waiting a favorable opportunity for revenge, he kept a strict watch upon the animal. Time passed away; the camel, perceiving that it was watched, was quiet and obedient, and the driver began to think that the beating was forgotten, when one night, after the lapse of several months, the man was sleeping on a raised platform in the mill, while, as is customary, the camel was stabled in a corner. Happening to awake, the driver observed by the bright moonlight that, when all was quiet, the animal looked cautiously around, rose softly, and stealing towards a spot where a bundle of clothes and a bernous, thrown carelessly on the ground, resembled a sleeping figure, cast itself with violence upon them, rolling with all its weight, and tearing them most violently with its teeth. Satisfied that its revenge was complete, the camel was returning to its corner, when the driver sat up and spoke. At the sound of his voice and perceiving the mistake it had made, the animal was so mortified at the failure and discovery of its scheme, that it dashed its head against the wall and died on the spot."—Cassell's Natural History.

THE FIRST BABY IN CALIFORNIA.

It was on the Fourth of July, and Downieville celebrated. The stars and stripes floated from a peeled and lofty pine, and the chorus of the anvil had reechoed through the hills. The house was crowded with the miners; poet, reader and orator had performed their parts, and the recently organized brass band was giving in boisterous resonance some National anthem, when, suddenly, there burst out the feeble wail of an infant; first low, then swelling out in all the defiant strength of his baby lungs. The band put forth its loudest strains; the baby, incited to renewed exertion, redoubled its vigor.

It was nip and tuck between the band and the baby. The young mother did her best to divert the child and hush him, when from the audience there up-rose a brawny miner, and shaking his fist at the musicians, he cried: "Hush that blamed band, and give the baby a chance!" The band stopped its playing, and never did stalwart men listen to sweeter music than those exiles from home and women, as they drank in the tones of the wailing child. There were tears in many an eye. The child was hushed upon its mother's breast, and at the word there went up three rousing cheers for the first baby of the Northern Sierras.

USEFUL MATTERS OF FACT.

Incrusted bronze is mentioned as a recent Parisian novelty in bronze or copper ware, with gold and silver ornamentation. To fix the latter on articles of bronze or copper, they are first painted in water colors, the principal ingredient of which is white lead. When several articles are to receive the same drawing, it may be printed in the same manner as porcelain painting. The places which remain unpainted are varnished. The object is then laid in dilute nitric acid, which dissolves the color and bites the metal on the painted parts to the required depths; after washing the object, it is placed in a gold or silver bath, where the free surfaces are electrotyped in silver or gold; the varnish is then removed, and the whole surface is polished so that the gilded and silvered parts are not unduly prominent. After this comes the bronzing, a fine effect, it is said, being produced with black bronze by sulphide of copper in the spaces between the gold and silver.

Archers were a formidable part of all ancient armies, and the use of the bow seems to have been known to all nations when first discovered. The Scythians were the best ancient archers, and the English among the moderns. The victories of Cressy, Poictiers and Agincourt were chiefly gained by the English archers. The Scythian bow was of horn. The English long bow was five feet six, and it was made of steel and brass. Arrows were from three to five feet. Ash was used by the English and goose feathered, two of the fledges white and one black. The heads were iron or brass, with light steel points and small barbs. The strings were of gut or hide or hemp. A sheaf of arrows was twenty-four, and the archer was armed with a maul and a dagger. The English archers drew to the ear steadily. A furlong was the distance of the butt in shooting at marks. The Parthian cavalry were thought to be very formidable as they discharged their arrows backwards, and could thus shoot equally well while retreating.

M. Tovama describes a simple way of seeing stereoscopic pictures without the use of lenses and without any straining of the eyes. The two pictures are to be mounted with an interval between them of about an inch and a half. Then by means of a partition between the pictures and the eye, on the ordinary skeleton stereoscope, the two parts are so separated that the right eye shall see only the right picture and the left eye the left picture. When this is done the two pictures will combine just as easily as with an ordinary stereoscope.

The blackness of certain public buildings in London and elsewhere, for a long time attributed to the effect of smoke, has lately been found to be in great part the result of the development of a peculiar fungus, the precise nature of which has not yet been determined. This suggests the possibility of so treating the surface of the stone as to secure the removal of the coating, since any substance that will kill this low form of vegetable life will probably permit its ready removal—a result much less easily attained if it were a deposit of smoke or soot.

The telephone has been exhibited on the island of Formosa, in the China Sea, in the presence of the Imperial Governor. Messages were transmitted a distance of 30 miles, to the surprise of the Chinamen, who showed deep interest in the experiments.

To Make Moss Adhere to Wood Crosses.—Dissolve gum tragacanth to a thick mucilage, and after putting a first covering of moss on the cross, put it away to dry. The second or third time every part can be partly covered, and it will firmly adhere.

To clean lamp chimneys, hold them over the nose of the teakettle when the kettle is boiling furiously. One or two repetitions of this process will make them beautifully clean. Of course they must be wiped upon a clean cloth.

Ground Tea.—A French chemist asserts that if tea be ground like coffee, immediately before hot water is poured upon it, it will yield nearly double the amount of its exhilarating qualities.

A good waterproof paper for covering jars used in preserving, etc., may be made by brushing over the paper with boiled linseed oil and suspending it over a line until dry.

Ordinary red bricks may be enameled or glazed by subjecting them, while well heated, to the action of the vapor of common salt fused in the furnace.

Stove Polish.—The best black ink mixed with the whites of eggs makes a good stove polish.

MAGAZINES.

Appleton's Journal for July, contains some most excellent reading which cannot fail to secure for it a wide audience; but the article which will appeal most strongly to Rural readers will be the story which occupies the place of honor; Ricarda, by Mary Wager-Fisher. Before one has read a column of it, the sex of the author is revealed. No one but a woman of strong sympathies, and one keenly alive to what love and wifehood mean to women, could have shown so delicate a perception of the attitude of the average wife toward the man whose name she bears. In a series of conversations, carried on between a gentleman of rather conservative tendencies, and one who sees in marriage only intolerable slavery for women, the reader is treated to some novel, instructive and strong views of certain phases of social life. The masculine egotism which considers that, by taking a woman to wife, it is entitled to demand of her utter self-renunciation, receives some well-merited criticism. What the author has to say of forcing girls to become pianists is a so thoroughly, common-sense view of the subject, that it is to be regretted for the sake of myriads of girl martyrs to this modern instrument of torture that it is not possible to secure for the "view" a reading by every woman—be she maid, widow or wife. The whole drift of the story shows that it is the result of a careful study of love in its relations to womanhood. While there is no indication of a desire to overturn existing social relations or any hint that it is best for woman to be alone, still, the necessity for some radical change in the relative positions of wives and husbands, is plainly pointed out. It must not be inferred from the foregoing that this is one of those tiresome stories modelled after Chas. Reade's tales, "with a purpose" wherein every thing—incident, character and dialogue—is subordinated to the purpose. Quite the contrary, in Ricarda, the characters have had the breath of life breathed into them, they are not merely mouthpieces through which the author gives expression to her views. The story is bright, suggestive and entertaining, and well repays a reading.

The other articles are: Reforms in Asiatic Turkey; Italian sketches. I. The Homes of the Plaster-Image Men. II. Italian Moving; The Sunny Side, a novel. The Midway Inn; by James Payn. Conspiracies in Russia; Karl Blind, Moralists on Blue China; Mr. Browning's Dramatic Idyls; The Queen's Private Apartments at Windsor; The Rose of Love; a poem; Marie Le Baron. Editor's Table and Books of the Day, conclude the number.

Phrenological Journal.—Contents: Arthur Penrhyn, (Dean) Stanley, with portrait; Fire-flies: the Lampyrics, Glow-worm, Cucajo; Temperature vs. Respirativeness; Making a Home; Mrs. Belva A. Lockwood, port.; Brain and Mind, chap. xiv., applied in the Education of Children; Uncle Jimmie, the Cripple; The Thorn-bush; Russel's Sickness; A Florentine Orphanage; Philosophy of Reaction; Simple Curvature of the Spine, with illustrations; Isaac Pitman on Diet; Some Characteristics of the Late Epidemic; Poetry—Summer, The Old Ruin, The Innocent Sleep, Drifting with the Tide, Take a Drink; Editorial Items; Notes in Science and Agriculture; Answers to Correspondents; What They Say; Library; Personal Items; Wisdom; Mirth.

Hints on Bathing.—Avoid bathing within two hours after a meal, or when exhausted by fatigue or from any other cause, or when the body is cooling after perspiration, and avoid bathing altogether in the open air if, after being a short time in the water, there is a sense of chilliness, with numbness of the hands and feet; but bathe when the body is warm, provided no time is lost in getting into the water. Avoid chilling the body by sitting or standing undressed on the banks or in boats after having been in the water, or remaining too long in the water, but leave the water immediately when there is the slightest feeling of chilliness. The vigorous and strong may bathe early in the morning on an empty stomach, but the young and those who are weak had better bathe two or three hours after a meal; the best time for such is from two to three hours after breakfast. Those who are subject to attacks of giddiness or faintness, and who suffer from palpitation and other sense of discomfort at the heart, should not bathe without first consulting their medical advisers.—*Phrenological Journal for July.*

Herald of Health, Contents for July.—Physiological and Sanitary Marriage and Parentage, by the Editor; Where there's a Will there's always a Way, Eleanor Kirk; Wear and Rest, Mrs. Chilion B. Allen, M. D; Life—Heaven—The Gold of Hope—Facts and Fancies—Good Advice. Practical Hygiene in Jails. The Last of the Hohenzollerns; Death of William Lloyd Garrison—A charming Old Age; Hygienic Rural Resort and Colony; A Cheap Breakfast—Oatmeal Pudding; To Cook Cabbage and Cauliflower—Dietetic Medicine—Material for Breakfast—School-room Headaches; Effervescing Gruel—Cleanliness for Children—Current Literature; Health Foods.

The Last of the Hohenzollerns.—"This will be the last of our fine Hohenzollern race," were the words of Bismark when he heard of the proposed marriage of the Crown Prince of Prussia to the daughter of Queen Victoria. The practice of intermarriage among royal families, which has been going on in Europe for centuries, and which has resulted in a close relationship among the great body of the royality of Europe, has, as is well known, had a most deteriorating effect upon both the physical health and mental capacity of the reigning families. Throughout the whole Christian era one royal family after another has arisen, founded by some military hero or statesman, and has maintained its physical and moral stamina for a few generations, and then under the combined influence of princely dissipation and the physical weakness that results from the intermarriage of relatives, has become so effeminate as to lose its power and pass away, giving place to some younger and more vigorous family.

The statesmen who have determined the marriage alliances of such families have seldom had the practical wisdom to apply the principles of natural science in the choice of suitable companions for the royal youths whom they serve. It would, appear, however, from the remark of Bismark which we have quoted, that he realizes the importance of preserving by wise marriages the physical and mental stamina of the grand Hohenzollern race which now rules the German Empire; nearly all the members of which are still noted for their physical and mental strength and vigor. But the warning which he uttered was unheeded, and the young family which resulted from the marriage that he opposed, is, though intellectually bright, so weak physically, that there is scarce a prospect of its ever giving to the German throne a ruler fit to succeed the glorious old Emperor William, or his gallant son, the present Crown Prince.

The art of human culture, or "stirpiculture," as it now called, is of all sciences the most important to human welfare and progress; and when from the throne to the cabin of the peasant its teachings are observed in determining marriage relations, and above all, in prohibiting unfit marriages, the world will have entered upon an era of progress such as can never be secured by the devices of statesmen or the labors of philanthropists.—*Herald of Health.*

BRIC-A-BRAC.

AN ENTOMOLOGICAL LOVE AFFAIR.

He spider locust talking to
The apple of his eye—
He gave a hopper two and yelled,
"Aha, you'd butterfly!"

The skipper's brow with rage was knit—
"I tick my leave," quoth he,
"And you shall sometime feel my mite,
Although just now I flea."

"O Katy, dear, my heart is yours,"
The other fellow said;
"These ages it has beat for you—
'Twill beetle I am dead!"

"See, yonder lies my little farm—
Come, let's together roam;
Make thou my farm a paradise,
My little house thy home!"

The maiden gnat the mansion glanced,
Then on his breast she hid
Her pretty face—did she accept!
Conclusion: Katy did. [*St. Louis Journal.*

Mary Clemmer, in a poem addressed to John G. Whittier, says: "Thou hast never taken my hand, nor looked into my face all tenderwise." And we don't suppose he ever will, for he is now too old for such foolishness. When he remembers the deplorable fix Mr. Cameron got into by simply sending the widow a few oranges, he firmly resolves that he will continue never to take a woman's hand and look tenderwise into her face. Mr. Whittier is a very sensible person, if he does write poetry.—*Norristown Herald.*

STATE STATEMENT.

I never in the State of Maine have ever taken tea,
Yet all of its inhabitants are very fond of "*Me.*"
About the "Old Bay State" there's something far too strange to pass,
For all who go to Boston are sure to go to "*Mass.*"
The folks in "Little Rhody" may not be very dry,
Yet every person seems to have a fervent love for "*R. I.*"
In the Centennial "Keystone State" the women and the men
Talk proudly of their worthy "*Pa.*," and also of his "*Penn.*"
And even we in Gotham, with prospects proud and high,
Well know our State is always near, because of course it's "*N. Y.*"
Far in the South, quite "*Ala.*" mode, a mighty State holds sway,
While close beside it is another, always light and "*Ga.*"
Another one we cannot "*Miss.*"—its merits well we know—
And further north large cities that are always bound to "*O.*"
And now I think I'll cease my rhymes—no doubt you've had your fill;
If I should take you further West, you might be taken "*Ill.*" *Baltimore Sun.*

"Are grapes healthy?" asks an exchange. As a fruit, opinions differ. George Washington, Christopher Columbus, Noah, Napoleon the First, and Mary, Queen of Scots, ate grapes, and they are all dead now. Draw your own conclusions.

An incidental.

He dropped his teeth in the flowing tide,
As he feebly leaned o'er the vessel's side,
His troubles internal and mental.
"Quite a misfortune," they said to him.
But he answered coolly, with visage grim,
"Oh, merely an in-sea-dental!"

Mr. Talmage's remark when the crowd hoisted him on their shoulders—"Gentlemen, gentlemen! There is evidently a mistake. I assure you I have my legs with me."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

MY CREED.

I hold that Christian grace abounds
Where charity is seen; that when
We climb to heaven, 'tis on the rounds
Of love to men.

I hold all else, named piety,
A selfish scheme, a vain pretense;
Where center is not, can there be
Circumference?

This I moreover hold, and dare
Affirm wher'er my rhyme may go:
Whatever things be sweet or fair,
Love makes them so.

Whether it be the lullabies
That charm to rest the nursling bird,
Or that sweet confidence of sighs
And blushes made without a word;

Whether the dazzling and the flush
Of softly sumptuous garden bowers,
Or by some cabin door, a bush
Of ragged flowers.

'Tis not the wide phylactery,
Nor stubborn fast, nor stated prayers,
That makes us saints; we judge the tree
By what it bears.

And when a man can live apart
From works, on theologic trust,
I know the blood about his heart
Is dry as dust.

LETTERS FROM A COUNTRY GIRL—No. 15.

MARGARET B. HARVEY.

Painting In Oils.

By this time, I suppose, my friends must have perceived that I, too, have had the "art craze." Well, so I have, indeed, and I am not over it yet; in fact, I hope to retain a mild form of the disease throughout the balance of my natural life. And to those of my readers who are beginning to indulge in the same hope, I would say; if you are once truly infected, you will never get over it completely, and you will find in the possession a never-failing source of gratification. If you want to dabble in oil colors, you will never be sorry, having once attained the slightest degree of success. Provided you don't attempt too much, I think I can safely say that you will probably succeed better in oils than in water-colors. Painting flowers in the latter materials constitutes an exquisite, delicate, distinct art by itself, and is rather out of the common way for amateurs, though, as I tried to show in my last letter, very few need be afraid to attempt a little of something.

Oil-colors come in tubes at prices ranging, according to the pigments and size of the vessels from fifteen cents up to about a dollar. An assortment of long-handled sable brushes, running from numbers three to eight, round and flat will be required. Of these it is best to have the smaller round, and the larger flat, they cost about fifteen cents apiece. The place of a palette may be supplied by a common dinner-plate, and of a palette-knife by an ordinary pen-knife. Have also, plenty of rags and a bottle of turpentine at your elbow. In squeezing the tubes, close the thumb and finger firmly over the bottom-edge exceedingly close, so that there will never be a portion left between the base and the hand. Never press out more than you think you need, as it is next to impossible to save paint once out of the tube. Drop on the palette, and the color is ready for use, just as you see it. There is not, as in water colors, any washing, and rubbing and waiting for a drying process, to be gone through with before you can judge of effect. You will, most likely get your brushes and fingers, perhaps, also, your dress, exceedingly dirty but the rags and the turpentine will remedy all that. What I have said about the impossibility of imitating nature, and the falsity of mere, heartless copies and the rightfulness of aiming at usual characteristics and general effect, will hold good in the main, as regards oils. But in this case, I would add that it is neither easy nor necessary to put in the same amount of fine, delicate work as in water-colors, even in treating precisely the same subjects. For one thing, the vehicles now under consideration have a richness and brilliancy in themselves which the others lack; and for another, an effect is much more speedily attained by them.

Draw the object to be painted with a fine brush, loaded with white paint. Further than this, I can give no other rule than: Observe nature, use your judgment, and consult your heart,—for you must *love* what you seek to portray. But, contrary to the necessities of water-color painting, you need put in no elaborate groundwork, for here you can frequently see your way clear from the beginning. In mixing colors, you can often hit the shade you want almost instantly.

The *technique*, as you see, is in fact just nothing. Everything depends on your own eye and taste and hand. The generality of mankind, and more especially womankind, have been afraid to attempt anything in this line because they have heard so much of wonderful genius and grand creations, and a great deal of high-flown talk

about the "world of art." But because Tasso and Shakespeare wielded the pen, is it therefore presuming in any of us to become so much its master as to compose agreeable letters, such as will delight our friends? Seize the brush, then, as well—one may be a true artist, and a successful one, and never see a picture.

In connection with the other style of painting, I spoke of some articles upon which our fair sisters might expend their energies. I will add here, that whoever has learned the use of oil paints has always at hand a universal beautifier; has always the means at her command to create loveliness and combat the hard, and cold, and ugly, and common. Shall I tell how?

Take two plain, smooth bottles, with glass stoppers, and cover them smoothly with bright silk or satin, finishing at the necks with frills of lace. Then paint a spray of wild flowers upon each, and you have a toilet set fit for a queen,—you just ought to see my pretty red ones, adorned as they are, one with a blood-root, the other, an anemone, nestling each in the soft bed of a dainty, red and white moss-mat. And you can—I won't patent my invention,—make a lovely hair-receiver and hair-pin cushion of cylinders of birch bark, finished with red zephyr and satin, using the bark just as anybody else would perforated board, and then painting upon it lilies of the valley precisely where other people would stick scrap pictures. And you can convert an old, cracked flower-pot into "a thing of beauty" and "a joy forever," and make it do duty as a great bouquet holder, by mottling all over it a dark ground, and lighting it up by a multitudinous array of gay, tiny Japanese fans. Pick up the rusty horseshoes out of the barnyard, wipe them, paint on them a black foundation and a wreath of red berries or blue forget-me-nots, and suspend them to little easels, or over your parlor-door, (on the inside, of course,) by ribbon run through.

CHILDREN TEETHING.

This is a very trying time for the little ones, and for that matter, it is trying for their mothers too. Dear little things, they feel uncomfortable, and have no idea what the trouble is, and so they worry and fret; and it is a wonder, if mamma don't get cross too. I have one piece of advice to give young mothers, that if they will bear in mind, and practice, will be of more real value to them than gold. *Never get nervous* and irritable with your children. Keep calm and cool, whatever happens. You think, it is impossible; but it is not; it has been done by many mothers and more can do it if they only try. A baby cannot be hushed to sleep, if its mother is all in a flutter; the little thing will cry and worry, till it is all tired out, and goes off to sleep through clear exhaustion. It does not have a good restful nap, but starts and jumps, and its mother has to rock it to keep it tolerably quiet. Young mothers, this is not an old woman's whim, it is truth; try for yourselves and see. There is a sympathy between a mother and her babe, and if the mother's nerves are all unstrung, baby's will be the same. But I was going to talk about teething.

Children suffer terribly sometimes, even to death; and if mothers only understood how to manage them, they would be spared a great amount of pain. In the first place, keep soft flannel next the body, till they are two years old, certainly. Then never neglect to keep close watch of the little mouth so as to know if the gums get inflamed and swollen. It is often a great relief to have the gums lanced, it should always be done, if there is a purple hue upon them. The bowels should be kept open by a suitable diet—oat meal gruel, chicken broth, beef tea, are all good and proper food for little people—neither candies nor sweets of any kind are healthy, they cause the food to coagulate in the stomach and the result is pain, then of course, baby cries, in distress. A very nice thing to draw inflammation from the gums, is to take the feelers on lobsters (they are the long slender things that grow from the head), and cut them up into pieces, a little more than a quarter of an inch long, and string them like beads, and put them on the babe's neck. You will be astonished to see how quick they draw the inflammation from the gums, and cause a fine eruption of the skin all around the neck; sponging the head in cold water is very soothing; but above all things, let the child be out of doors all that is possible. It gains strength and then its mind is diverted from its uncomfortable sensations, and a baby is better every way for enjoying the sunshine and pure air. It is better than medicine of any kind. Where one lives in the country, there is no excuse for shutting children up in the house. I do not know how city people do manage to raise children. I should think they would all die for lack of air and sunshine. I do not wonder that city-raised people are puny and dwarfish, I think it more of a wonder that they live at all. Open air is needful to make any living thing develop and grow, and sunshine gives animal and vegetable nature strength.

Our minister's wife was a nice sweet woman, and she had a pretty babe about eleven months old, but it was a delicate child. Its mother was so afraid that a breath of air should blow on it, that she would insist that every window and door was kept closed. I wanted to tell her she was spoiling the child, but somehow it did not come handy to do it, and I never like to give counsel unless asked for it. One day she sent for me to come quick, as baby was in a fit; so of course I went; the poor woman was crying and wringing her hands: "Baby will die! baby will die!" and baby lay in its cradle in convulsions.

"Oh, I hope not; do try and be calm," said I, taking the little creature on my lap. I got my finger in its mouth so as to see its gums. The eye-teeth were cutting, and the gums were swollen fearfully and ulcerated. "Here is the trouble. Get a lancet, quick;" but they had none, neither a sharp penknife, and the village physician was five miles away. "Well, give me a darning needle." They had that, and I pierced the ulcerated places, and they discharged fearfully. I then soaked the little feet in warm water, wilted some burdock leaves for drafts on the feet and put a mustard plaster between the shoulders, and in just fifteen minutes from the time I came in the house the baby was nestled in its mother's bosom, looking a little pale, but its fever was gone, and in two days those eye-teeth were cut through all right.

"I think baby would have died, grandmother, if you had not come; how can I thank you enough?" "By learning how to take care of her yourself," and then I had a good chance to talk to her about training up children; and she was a good, sensible woman, and remembered what I said, and practiced it, too. The rest of the children fell into the hands of a wise mother, and she had no more trouble about convulsions or fits, or even delicate babies. The younger children cut their teeth the easier they come, but there is a great difference in age about cutting teeth. Some have four teeth through at four months, while others do not have more than that at a year old. Opiates of all kinds are injurious to children. A little sage, or catnip tea, is better than a gross of soothing syrup or a gallon of paregoric. Burdock leaves are a grand thing to use with children, and grown-up people, too. I would never be without them in the house; they allay inflammation and ease pain so quickly, if they had not been so useful, God would never have spread them so plentifully around every house, so that they could have been gathered so readily. I have seen them applied to the bowels in cases of inflammation, and never knew them to fail in giving relief. For toothache and neuralgia they are excellent; for sore throat they are good. If green, you want to wilt them on the stove before applying; if dried, you want to warm and soften them with either warm water or vinegar. They are better than doctor's stuff at any time, and can be got quicker.

A mother must have her thoughts about her, and not get frightened when the children fall sick. No one needs presence of mind as much as a mother; and she must learn to think quick and act promptly when a sudden emergency comes up. Many painful hours and sick days could be avoided if mothers would only take proper precautions and use suitable remedies when the little ones are first taken sick. A warm foot-bath is one of the best things in the world to allay pain, and it is generally the last thing that is thought of in cases of fever or inflammation. Just have your thoughts about you, and learn what to do.

GRANDMOTHER.

A BREEZE IN TIMBERVILLE.

Eds. Woman's Journal:—Tabitha Bowers wrote to me that she saw an article signed with my name in your paper copied from the Inter-ocean (see RURAL NEW-YORKER of May 10th), and I thought if you were kind enough to do that, may be you could give me some light in these matters, and I am sadly troubled. My letter, which was published in the Inter-ocean, somehow fell into the hands of Elder Jenkins, and he came to me very much disturbed in mind. It seemed so strange, he said, that after listening to his preaching so many years, I should now be led astray by these infidel reformers. In vain I assured him that I was still sound in the faith, and was only seeking to understand the real meaning of St. Paul's teachings and their application to the present time. He replied that the very fact of my having written to a secular newspaper for information, was evidence sufficient of my lukewarmness. "Why, Elder Jenkins, what could I do," I cried in my dismay, "I had no husband to ask?" He patted me on the head (for he had taken his seat very near me, as is the ministerial custom), and looking smilingly right into my eyes said, "Why, child, could not you ask your pastor?" I do not suppose anybody in Timberville will see your paper, leastwise I hope Elder Jenkins won't, but I must confess I felt real uncomfortable. In the first place, I am by no means a child—being about midway between childhood's first and second stages. Again, I do not think it is nice for men, even if they are ministers, to pat women on their heads and call it a fatherly interest. I had a good father, but when I became a woman he treated me as such, and I can not make such manners seem natural. But I shoved my chair a little farther off and put on as brave a face as I could, and asked him if he would tell me just how he understood St. Paul. He said that Woman was the "weaker vessel" and that it was a shame for her to "speak in church," or to "pray with uncovered head," that they should not wear "broidered hair, or gold, or pearls, or costly array." Now, I do not know what the fashions are in Boston, but in Timberville the women's bonnets hang on their back hair, and their heads are all uncovered, and they wear great heavy gold chains outside of all their wraps, and they go to church with their hair frizzed and braided in a most marvelous manner, and never a minister has opened his mouth to condemn such unseemly apparel. Latterly, however, they wear what they call "bangs," and the hair comes clear down to their eyes, and maybe St. Paul is responsible for the style. I must say that I have noticed with pain that at our church sociables Elder Jenkins pays a great deal more attention to these gaily dressed ladies than he does to the soberly attired women of his flock, and sometimes when I have been thinking it over, I have been almost afraid St. Paul might have done the same.

Then the Elder went on to say that according to Paul "Adam was not deceived; but the woman being deceived was in the transgression." I asked him if that meant that Eve, really believing that the eating of the apple would make her wise, was a greater sinner than Adam, who ate his with his eyes open just because Eve offered it to him? He said that all the misery in the world was the result of Eve's insane desire for wisdom; that if all women were wise it would subvert the entire order of creation, for their husbands could no longer rule over them; as to Adam, he went on to say his sin was a manly one, and that the sins men committed in consequence of the attractions of women were never visited so heavily upon the men as upon the women, by nature or society; Woman invariably paid the penalty. It might appear hard, but he believed it was according to the established order of things. Then I asked him what St. Paul meant when he said, "Let not a widow be taken into the number under threescore years old, having been the wife of one man, well reported of for good works; if she have brought up children, if she have washed the saints' feet, if she have relieved the afflicted, if she have diligently followed every good work. But the younger widows refuse." He looked at his watch and said his call was already too long, that he had agreed to meet a committee of ladies that afternoon who were trying to devise means to raise the minister's salary and refurnish the parsonage; there was to be a donation party; and then they already had a sewing society and a mite society, which met every week; but they thought, perhaps, something might be done in the way of noonday lunches and strawberry festivals in the evening. In parting he again laid his hand upon my head (this time solemnly as if he were to pronounce the benediction) and said, "My dear child, do not distress yourself with such abstruse questions; but live quietly in the sphere where you rightfully belong, remembering always that 'Great is the mystery of godliness.'" Now Mr. or Mrs. Editor, whichever you may be, I belong to that committee, and am expected to meet with them to try to raise this good man's salary. I do not outstep my sphere when I go around with a subscription paper for his benefit. I am considered modest when I force tickets for church festivals on unwilling buyers; in short, I can do a great many things which are exceedingly revolting to my own sense of propriety, and be told that I am only "bearing my cross," but when I dare think for myself upon any subject, no matter how quiet, I am, I get out of my sphere directly.

DORCAS ALLEN.

GOOD INTENTIONS.

If all the letters written in my mind, had been sent to the "Woman's Club" and accepted, I would surely have had a hearing before this. I enjoy every issue of the dear RURAL, and think the "Club" a very helpful part of the paper.

As the months have passed by, I have thought I would surely write before the next "meeting," and while making beds, dusting, mending, etc., my thoughts were busy; so day after day passed, and I never sat down to the task. By-and-by I passed into the invalid corps, and during the weeks that have now lengthened into months, I have read letters that were cheering and helpful, and in my seclusion, gave me peeps into other women's lives.

While suffering I have been happy with husband and children; but the plans and resolutions I have formed day after day, if written, would even exceed my imaginary letters to the "Club." As time passed, and the strength I expected did not come, one code of resolutions after another passed out of mind, that were never "presented before the house."

So is life, more or less, to every one. I commenced to study periods of history, and Miss Harvey's letter was the means of my botany coming down off the shelf the first time any one came in to get it for me. I would like to renew my drawing again. Miss Harvey's directions are very plain and encouraging, and half the battle is almost won when one fairly commences. I will have to wait for strength; but let me say to every mother who reads this (and fathers, too), cultivate your minds and hearts; strive to be intelligent and cultivated. Do not spend the golden part of your lives accumulating property for your children, while you yourselves feed on *husks*. If you do, old age will find you *duraffel*—your children will find you so, and although they may love you too much to utter it, their hearts will bleed over the fact.

All children will not bury it in their hearts. Parents are often told how little they know, which is most sad, for it embitters instead of purifying.

How much we mothers ought to look to Christ, asking that our frail bark with our heart treasures may be guided in the truest way on earth, and into the safe haven above. He is our true helper.

"Just before going to press," as the editors say—which is partly true in my case, as I was about to mail this—I read M. A. B.'s "Truly Spoken," of June 21. I commend it to all for even more than a second reading. Dear sisters, there is meat in it of the most nourishing kind, for if partaken of, it will strengthen the soul. MARGUERITE.

EXCEPTION TAKEN TO JACQUELINA'S VIEWS.

I am surprised that the many RURAL readers have suffered the article of Jacquelina, in RURAL of May 3, to pass unanswered. I have waited, hoping that an abler pen would defend the teachings of the Bible. She says: "If there is one lesson which is being constantly impressed on our attention, it is that there are no providences in matters of worldly advancement."

I have heard of a man in one of our large cities who started in business with but small capital. He promised God if he would prosper him he would give to Him one per cent. of all he made. He kept his promise, and in the course of a few years was enabled to pay $40,000 into the treasury of the Lord. Was there no providence in that? I must certainly think God does not mean what He says. If she does, what will she do with "No good thing will He withhold from those who walk uprightly?" also, "But seek ye first the kingdom of God and His righteousness, and all these things shall be added unto you?"

I do not understand by that that we are to seek God, and then sit quietly with folded hands and wait for God to feed and clothe us. But I do believe if we seek God faithfully, and serve him willingly and obediently, He will help us in worldly matters, for certainly such is the teaching of the text quoted. How can we believe less, and accept God's holy word as truth?

Now, concerning those people in the hospitals and poor-houses, I would say with a very wise man, "I have been young, and now I am old, yet have I never seen the righteous forsaken or his seed begging bread." God knows how near they lived to Him.

I would also like to know how she would reconcile her views with the well-known case of George Muller, of Bristol?

About building and supporting churches, will Jacquelina please read Malachi, 3d chapter, 8th, 9th, 10th and 11th verses, and tell us what God means there? FAITH.

THE REASONS WHY.

SOMEBODY—a crusty old bachelor, of course, inquires why, when Eve was manufactured of a spare rib, a servant was not made at the same time to wait on her? Somebody else—a woman, we imagine—replies in the following strain: "Because Adam never came whining to Eve with a ragged stocking to be darned, collar string to be sewed on, or a glove to mend, 'right away—quick now!' Because he never read the newspapers until the sun got down behind the palm-trees, and stretching out, yawned out, 'Is not supper most ready, my dear?' Not he. He made the fire and hung the kettle over it himself, and, we will venture to say, pulled the radishes, peeled the potatoes, and did everything else he ought to do. He milked the cows, fed the chickens, and looked after the pigs himself, and he never brought home half-a-dozen friends to dinner when Eve hadn't fresh pomegranates. He never stayed out till eleven o'clock to a political meeting, hurrahing for an out-and-out candidate, and then scolding because poor Eve was sitting up and crying inside the gates. He never played billiards, rolled ten-pins, and drove fast horses, nor choked Eve with cigar smoke. He never loafed around corner groceries while Eve was rocking little Cain's cradle at home. In short, he did not think that she was especially created for the purpose of waiting on him, and he had no idea that it would disgrace him to lighten Eve's cares a little. That is the reason why Eve did not need a hired girl, and from it may be inferred the reason why her fair descendants do."—*Woman at Work.*

ERRATUM.

IN the Women's Department of June 14th a lady correspondent was made unjustly responsible for a number of errors in naming plants and flowers. As a matter of simple justice to the lady we republish her letter as it should have appeared, and hereby tender her an apology for our inexcusable carelessness.

A Southern Lotter.

I have a beautiful flower garden, with many choice roses, lilies, shrubs, etc., etc. I would suggest an exchange of plants and seeds; many of your readers may have more of one kind of plants than he or she wishes, and would like to exchange for others. For instance, I have many of the longiflorum Lily, and would like to get the Lilium auratum in exchange. I also have the Caladium esculentum, Spanish Moss, many grasses, wax plants, etc. I live in Beaufort, S. C. We raise fine bananas and oranges. Our roses are trees, not shrubs. I wish you could see them. The Safrano, Lamarque, Bon Silene, Marechal Niel and Souvenir de la Malmaison, bloom all the year. I know they would astonish our Northern friends. I enjoy reading the RURAL NEW-YORKER, and will be pleased to correspond with you about other things. Respectfully, S. I. GIVENS.

A GOOD PRESCRIPTION.

PERSONAL cleanliness is not invariably a "passion" even with individuals in the upper ranks of society. We have heard of a British General whose antipathy to ablutions was a matter of notoriety among his friends and acquaintances. Meeting one of them, the General complained of being unwell.

"What seems to be the matter?" inquired the gentleman.

"Can't tell," said the General; "but I don't feel exactly well."

"Allow me to prescribe," said the gentleman.

No objection being offered, he advised the General to lose no time in procuring "a convenient tub, half filled with tepid water, and a big-sized lump of brown soap."

"Apply the soap and water liberally," said the gentleman, "and repeat the experiment again and again."

"Why," said the General, "that simply amounts to washing myself."

The gentleman, putting on a very serious look, remarked, "It is liable to that objection."

NEATLY PUT.—Last fall there was a division of the Freshman Latin class, containing thirty-six students, nearly half of whom were ladies. In looking over the records we find that there were nine members of the class who earned a standing of 100, and that seven of these were ladies. Now, girls, we noble males never complain because you swear, we never say a word against you because you chew tobacco, and we might in time become accustomed to your wrestling in the halls; but when you beat us in scholarship, you are carrying the joke too far.—*University Reporter (Iowa University).*

IN making Pumpkin pies, instead of using all ginger for seasoning, use two-thirds cinnamon and one-third ginger—quite an improvement to the taste!—try it.

Put your Madeira Vines and Dahlias at the back door; when you throw out water, they will grow so much as to surprise you, and take up the moisture so that the water will do no harm. V.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING SOUP.

One of the chief causes of waste in the kitchen is the neglect of little scraps of meat and bread, which, properly used, would form the groundwork of excellent soup. Every two days such scraps of meat and bones should be placed in a stew-pan, well covered with water, and left to simmer gently for several hours. When sufficiently stewed, the stock should be put away until quite cool, when every particle of grease should be carefully skimmed off. When needed, the stock should be placed on the fire, and used as the foundation of any soup wished. For vermicelli, the stock should be perfectly clear, seasoned to taste, and have a small quantity of vermicelli put in it half an hour before dinner. All soups are improved by a little thyme and cayenne pepper, and veal or chicken is much the better for a tiny infusion of grated lemon peel. Scraps of bread left at table may be toasted, cut into cubes, and eaten with clear soups. A favorite dish with us, invented in a moment of despair during the warm weather, is crab soup. To make it, take good strong stock and shred in it tomatoes and okra, or gumbo, until it is quite thick; flavor it strongly with birds-eye pepper (this is for one who has acquired a taste for Indian curry); let it boil gently for an hour and a half; strain it through a fine colander, and place it on the stove again. Ten or fifteen minutes before dinner put in it the flesh of several boiled crabs, shredded up. Let it simmer gently until served. Eat with toast.

Tomato soup is improved by the addition of a little okra, or a few peppers, but it needs an acquired taste to enjoy much of the latter.

We cut okra in slices and dry it, to use in the winter as a flavoring for soups and stews.

In making bean soup, put just a pinch of sugar in it; it takes away the roughness of the flavor. EMILY L. TAPLIN.

Maywood., N. J.

DOMESTIC RECIPES.

Pickled Onions.

SELECT small onions, remove with a knife all of the outer skin so that each will be white and clean; drop into brine strong enough to float an egg and let remain there six hours. Bring strong vinegar to a boil; add bits of horse-radish and cinnamon bark, with a few cloves and two or three red peppers, and pour hot over the onions, previously drained from the brine.

Currant Jam.

Pick free from stems and leaves, wash, weigh and crush; put into a porcelain kettle and place on the back of the stove where they will gradually heat; then let boil twenty minutes and add sugar in the proportion of three-fourths pound to a pound of the fruit. Boil one-half hour longer, stirring most of the time. When done, put into small jars or glasses and either seal or secure like jelly with paper.

Michigan. MRS W.

Iron Rust.

Take dry cream-of-tartar and rub on with the finger while the cloth is wet. Hang or place where the sun will shine directly upon it. Should the rust not come out with the first application, repeat.

Fly Specks.

When these become set so that they will not wash or boil out, at the time of rinsing, turn a few drops of aqua-ammonia directly upon the spot and rub with the hand—they will almost entirely disappear. MRS. H. R.

Ice Cream.

One quart of milk, the yelks of four eggs, one large spoonful of flour stirred to a smooth paste in a little of the milk, and one pound of sugar; scald until thick, taking care not to let it burn. When cold, add one quart of whipped cream and the beaten whites of four eggs; flavor to suit the taste, and it is ready to be frozen.

DIRECTIONS FOR FREEZING ICE CREAM.

To make ice cream nicely and quickly, a suitable apparatus is indispensable. If one has no freezer, a tin pail with a closely-fitting cover can be made to answer. Set the pail in a basket—a large peach basket is good; pack equal quantities of coarse salt and finely-broken ice around the pail, nearly up to the rim; pour the prepared cream into the pail, taking care not to get any salt into it; cover the whole with flannel and leave for 20 minutes, that the cream may chill. Freeze by turning the pail half-way around and back, and every few minutes open the pail and stir the cream; for this purpose use a smooth stick.

Work fast while the pail is open as the air that reaches the cream delays the freezing process. Have a damp napkin at hand to wipe away the salt from the freezer every time that it is opened. It may be necessary to renew the ice and salt while shaking, as the freezing mixture must be kept close to the sides of the pail. When the cream becomes solid, cover again with flannel, and if convenient, let it stand for an hour before serving.

Strawberry Ice Cream.

One pint of very ripe strawberries rubbed through a sieve. Add a pint of whipped cream. Make very sweet and freeze.

Lemon Ice.

One pint of rich lemonade with a little grated rind of a lemon in it. It must be very sweet as it loses much in freezing. Add the whites of three eggs cut to a stiff froth. Freeze like ice cream The juices of any fruit, with sugar and water added, may be prepared in the same way. MRS. M. G. R.

Pickled Walnuts and Butternuts.

Select well-grown nuts, although tender enough to stick a pin through them; put them into a brine made in proportion to a pint of coarse salt to six quarts of water, boiled, skimmed and poured hot over the nuts. Leave them in this brine for four or five days; then take out, drain, wipe carefully, prick each nut two or three times with a large needle and throw into a pan of cold water; take out after two or three hours, pack into jars and pour over hot spiced vinegar.

Currant Jelly.

Look over the fruit and see that it is perfectly clean; crush and set on the back of the stove until heated through; strain and for every pint of juice measure a pint of sugar. put the fruit-juice on to boil and the sugar on a pan in an open oven to heat. Let the juice boil twenty-five minutes, skimming as needed. Then stir in the sugar, which should be very, very hot and boil five minutes longer. If the sugar was thoroughly heated, five minutes' boiling will be sufficient, but it will be best to test it before pouring out, by trying a little on a spoon. If the juice jellies as the spoon is turned from side to side it is done.

MARY B.

Gooseberry Jelly.

Pick the fruit before quite ripe; put into a dish and place in a kettle of hot water; cover closely and boil until the fruit is tender. Strain the same as currant jelly and to each pint of juice allow a pound of sugar; boil twenty minutes; turn into jelly cups and set in the sun for several days or until stiff. Protect from insects and dew.

Elderberry Wine.

Two quarts of juice; two quarts of water; four pounds of white sugar; put in a jar, cover with a thin cloth to protect from flies, and skim every day until well fermented. Then turn into a cask and cork tightly.

MRS. BRAYTON.

QUESTIONS ANSWERED.

Tomato Pie.

Mrs. McNair asks for a recipe for the Southern green tomato pie.

ANS.—Stew green tomatoes with very little water until tender, and for each pie allow one tablespoonful of butter, three of sugar and a little nutmeg. Bake between two crusts. The quantity of butter and sugar given is for a medium-sized pie.

Pastry Strips.

N. E. L., asks if the crisped strips, sometimes served with open tarts or coffee, are made of pie-paste.

ANS.—Yes, the paste is rolled quite thin and cut into narrow bands about a quarter of an inch in width and three or four inches in length. Bake on pans in a quick oven.

Alum-Water for Pickles.

Mrs. M. L. C., asks how to prepare alum-water for crisping pickles.

ANS.—Allow a teaspoonful of powdered alum to each quart of water; bring to a boil, draw to the back of the stove and put in the pickles previously soaked in brine. Let remain half a day, when the pickles should be taken out and thrown into cold water, there to remain until cold. Then wipe and pour over hot, spiced vinegar.

Spiced Currants.

Mrs. Whitcomb, asks for a good recipe for spiced currants.

ANS.—For five pounds of fruit allow two quarts of white sugar, one pint of vinegar, a tablespoonful each of ground cinnamon, cloves, allspice and mace. Boil the sugar and currants together as for preserves, and when quite thick, stir in the vinegar and spice, and boil fifteen or twenty minutes longer. Great care must be taken that the mixture does not burn at the bottom.

Sweet Green Tomato Pickles.

Miss Maggie Hall, asks how to make a sweet pickle out of green tomatoes.

ANS. — Wash, remove any imperfections, weigh out eight pounds, chop fine, add four pounds of white or light-brown sugar; boil slowly for three hours, then add a quart of vinegar and a dessert spoonful each of ground cinnamon and cloves. Boil fifteen or twenty minutes longer, and when cool, put into bottles or jars.

News of the Week.

MISCELLANEOUS.

Monday, July 7, 1879.

A general law was passed in the Senate of the forty-fifth Congress authorizing persons desiring to settle on public lands within railroad limits, to claim their homesteads out of odd sections in all States except Missouri and Arkansas. On the very last day of the extra session, the Senate bill, having the unanimous approval of the Committee on Public lands, passed the House and became a law, granting additional rights to settlers on railroad lands within these two States; authorizing them to claim their homesteads out of odd sections, just as they could do in other States. The general law, which is perfected by the new law, gives to every person the right to enter 160 acres instead of 80 acres, as heretofore. The new bill provides that odd sections within the limits of any grant of public lands to any railroad company in the States of Missouri and Arkansas, or to these States in aid of any railroad where even sections have been granted, shall be open to settlers under the Homestead laws to the extent of 160 acres. It further provides that any person who has, under existing laws, taken a homestead or any section within the limits of any railroad grant in these two States, who has been restricted to eighty acres, may enter an additional eighty acres of adjoining land embraced within his original entry. If additional land is subject to entry he may, if he wishes, surrender his entry to such States for cancelation, and thereafter can enter lands under the Homestead laws the same as though the surrendered entry had not been made. He can do so without payment of fees and commissions. It provides also that the residence of such persons, upon cultivation of land embraced on his original entry, shall be considered residence and cultivation for the same length of time upon and of land embraced in his additional or new entry, and shall be deducted from five years' residence and cultivation required by law; provided that in no case shall patent issue upon an additional or new homestead entry under this act until the person has actually and in conformity with the Homestead laws occupied, resided upon, and cultivated land embraced therein at least one year.

Just before its adjournment Congress rather unexpectedly passed the bill repealing the tax on quinine, relieving the country of one of the worst monopolies which disgrace our tariff. The wholesale price of quinine varies from $3 to $5 an ounce according to the demand, an occurrence like the Russo-Turkish war bringing about a rise in the price. The tax on this vital and high-priced commodity is 45 per cent ad valorem on quinine proper and 20 per cent on quinine sulphate, a prohibitory duty which enables two or three Philadelphia manufacturers to import the bark and charge from a third to a half more for turning it into quinine than they could without the duty. The entire revenue raised by this tax last year was less than $60,000, the total importations of both quinine and the sulphate being valued at less than $170,000, but the profits of one Philadelphia firm out of the manufacture of this article are put at millions, which is probably the reason that the members from Philadelphia attempted to prevent the passage of the bill. It is much to be feared, however, that the gain from the repeal of the tax on this necessity in some parts of the country, will go, every cent of it, into the pockets of the druggists. Already they make from six to twelve dollars a pound on retailing the article, and consequently they are not likely to make any decrease in the price on account of the trifling remission of duty.

Edison has just sent a man to England with 50 telephones on a new principal and of exceeding delicacy, to adapt them to the humidity of the English climate. He proposes to establish with these a telephonic exchange in London. As to the electric light, Mr. Edison says: "I have supplied six electric lights from one horse-power. These cost me just about one-third as much as three similar gas-burners will cost gas manufacturers. I claim that this solves the question." He is still perfecting the machinery for generation, so as to have it all right when manufactured in quantity. James Gorden Bennett's yacht Jeannette has arrived at San Francisco from Mare Island, Cal., and, in a few days will sail for the arctic regions on her way to hunt for the north pole. In the future most of the breadstuffs exported from this country to England will perhaps take the shape of flour. The English millers, it is reported, are discussing going out of the business, as the new American processes undersell them, and milling is no longer profitable with American grain. Hog cholera is making terrible ravages among the young pigs of southern Wisconsin, Jo Davies county, Ill., and Dubuque county, Ia. The disease spreads from drove to drove, carrying off the porkers by the hundred. The loss is incalculable, and has ruined some farmers and discouraged many more.

The clearing-house exchanges at the leading cities go on increasing week by week at a rate which makes it certain that the volume of business during the current year will be at least a fifth, and may be a fourth, larger than for last year. The returns for the last week reported show an increase of 23 per cent. over the corresponding week last year, and the advance is uniform over the country. New Orleans and Providence alone showing a decrease. This is one of the most trustworthy indications of a revival of business and a speedy return of "soft times." The extra session with its futile bickerings came to an end Tuesday. Monday the president sent in his veto of the bill making appropriations for the expenses of federal marshals, accompanying it with a special message calling attention to the necessity of making some provision for the performance of the important duties belonging to the officials. The republicans are very well satisfied with the methods taken by the president in these two messages to fix the responsibility of crippling the courts upon the democrats. The republicans further aided in fixing this responsibility by throwing adjournment over until Tuesday, so that there might be no excuse on the ground of lack of time. They thus forced a vote upon the proposition to make the needed appropriations for marshals and their deputies at elections. Thus brought to the test, the democrats of both houses made a record by voting against such unrestricted bills and for the ordinary routine work of the courts. This, the republicans hold, presents the issue clearly to the country, and places them in the position of refusing to enable the courts to pay for the ordinary business transacted by its marshals. These latter will continue to perform their duties, but they cannot be paid until a deficiency appropriation bill has been passed. The president has decided not to call Congress at present, but if much trouble arises in enforcing the revenue laws in the South, it may be necessary to assemble Congress before December.

The internal revenue receipts for the year ending this week will be some over $113,000,000, which is more than $3,000,000 above the receipts of last year, despite the reduction of the tobacco tax. The gain is due to a more thorough enforcement of revenue laws in the South, the breaking up of the tobacco ring in New Orleans alone adding $10,000 per month to the internal revenue. The leading gas companies of New York have just made a considerable reduction in their price. From the uniform charge of $2.50 per 1,000 feet they have come down to $2 and $1.90, the lower price being made to consumers who use 10,000 or more per month. The companies say the reduction is made on business principles purely, the decline in cost of materials permitting it. By the way, there is a great lull just now in the talk about Edison's electric light from which so much was expected. The inventor, however, is still "pegging away" at his devices in that connection. He has found more difficulty than his sanguine temperament expected in accomplishing his designs, but is still confident of success.

It is rumored and denied, that Archbishop Purcell's mind has become unsettled because of the financial embarrassments in which he is involved. There is about equal authority for the rumor and the denial. Considering the age and character of the prelate and the nature of his troubles, it would not be surprising if the rumor were true. Confidence in his personal integrity is so strong, and his character so firmly rooted, that everywhere sincere regret will be felt if it so prove. This year has been remarkable for the extremely violent storms and tornadoes that have visited various parts of the country. At Bismarck, Dakota Territory, Tuesday evening, a storm wrecked the steamer Montana, the largest and finest steamer on the Missouri river. It broke every chain in the vessel and carried the cabin ashore. Pieces of the cabin were blown 500 yards. The damage to the steamer is over $3,000. The damage in the city is put at $50,000. In House and Senate a total of 3,122 bills and 165 joint resolutions was introduced during the extra session.

A "bi-metallic league" has been formed in Chicago for the purpose of speedily restoring silver to its position as a money metal, "with the rights of coinage, the same as gold. The public meeting which gave it birth was called and attended by leading merchants, lawyers, judges, military men, and politicians. Not less than three judges made speeches. One declared that the panic, which ought to have run its course long ago, "still holds us in its grip;" another, that "the act demonetizing silver, in view of the manner of its passage and of its past and prospective evils, was one of the most cruel enactments that could be found on the statute-books of any civilized country;" a third, that "gold and silver were married in remote periods of antiquity, and destined for ever afterwards to go hand-in-hand as equals, and what God has joined together no man should put asunder." This sentiment was received with laughter, though there was no particular reason for its being singled out as amusing. A Colonel Daniels "spoke loudly, long, and earnestly in favor of a free, unlimited coinage of silver." He also provoked laughter and applause by saying that Senator Bayard "knew no more about the subject of finance than a calf." He said further that "the silver-men demanded the silver option; that the contract should be fulfilled; that the dollar paid should be of the same size that the people agreed to pay. If that didn't mean that they were in favor of honest money, he "should like to know what honest money was." The League appointed a Publication Committee, and will do what it can to insure the passage of the Warner Bill next December.

To-day 327 new money-order offices go into operation, covering all the States and Territories, except the Indian Territory. Nine money-order offices now in operation are to be discontinued, making an increase for the present fiscal year of 318. Sergeant Finney, of the signal service, left Washington the 1st of June, to investigate that terribly destructive cyclone which occurred in Kansas, Nebraska and Missouri the 29th and 30th of May. He visited over thirty cities and towns in the States named, surveyed the entire ground over which the storm passed, and states there was a general storm area in northern Kansas, southeastern Nebraska, and northwestern Missouri, and that he discovered eleven distinct tornadoes, two of which prevailed on the 29th, and nine on the 30th of May, all originating in that one storm area. He will make a full report to the signal service bureau.

The Atlanta, Ga., Constitution says the southern people hardly appreciate the amount of money that has been made in the south by the recent flurry in cotton speculations. There is scarcely a village that does not furnish its man who has made from $5,000 to $100,000. Colonel Sam Rico, of Montgomery, probably leads the list with $200,000; but there are several, two at least in Savannah and one in Rome, who are said to have made from $50,000 to $100,000. Albany furnishes a modest

dealer who picked up $22,500. In Savannah almost every dealer, of hundreds of dabblers, made largely. The Augusta News is authority for the statement that a man who didn't make as much as $5,000 is kicked out of the exchange. The gains in New Orleans are immense, it being said that that city pulled in $10,000,000. One of the fine features of all this gain, by the way, is that it comes in cash, and is paid without any long delay. As to Atlanta, we are hardly able to say positively what she cleared. It is certain that a great many have made money in snug quantities, but we hear dim reports of some persons who also lost money, though no serious amount. The cotton dealers in the South never closed a season in such fine spirits or so well fixed with the "needful." They are in better condition than ever before.

Our government having declared that it could not be indifferent to the interference of any European government in matters connected with the construction of the projected canal across the Isthmus of Darien, M. Lesseps now declares that the enterprise is entirely of a private nature, to be carried on by private capital, under private management, although, of course, it is his intention to seek from all governments an agreement that the completed work shall always be considered neutral in times of war. As a concession to American sensitiveness where the Monroe Doctrine is in danger of violation, he says that it is his intention to offer the honorary presidency of the company which will own the canal to Ex-President Grant. This would certainly be an honorable and lucrative position for a man whom *all* Americans of the future are sure to honor. By the way, he arrived in Yokohama, Japan, on the 3d, and it is reported that he will not reach home probably before next spring.

FOREIGN.

Wheat-growing on a large scale has only been carried on in the Argentine Republic for two or three years, and yet, at last accounts, 40 vessels were in the river La Plata loading with wheat for Europe. Immigrants from Italy, France and Germany are fast filling up the country, and their grain shipments may yet rival those of the United States. It is not easy to give the exact number of social democrats in Germany. If we take as a basis the 600,000 votes cast by this party at the parliamentary election, July 30, 1878, and allow about the same number for non-voters under 25 years of age, they may count, in round numbers, say 1,200,000 full-grown men. A startling fact is that, between the elections of 1874 and 1877, the social democrats nearly doubled their number of voters. This was partly owing to more thorough organization, and also to the hard times which drove many into their ranks, but at the last election, July 30, 1878, though they polled over 600,000 votes against 485,000 in 1877, they lost three seats in Parliament and have now only nine members of 397.

The Krupp gun works of Germany are of immense dimensions. One of the establishments employs 8,500 workmen, and contains 298 boilers and engines, which, combined, have 110,000 horse power, and operate 77 trip hammers, varying in weight from 200 to 100,000 pounds each. Since 1877, 15,000 cannon have been turned out; 300 are made on an average every month. Daily 18,000 tons of coal and coke are consumed, and 21,000 gas jets are in use. A railroad track, with 24 locomotives and 700 trucks, is in operation within the works, and between them and the nearest railway station. The establishment has 24 telegraph stations, and eight fire engines for protection against conflagration. In the mines connected with these works there are 5,300 workmen. Iron ore the company gets from its own lands in the north of Spain to the extent of 200,000 tons annually, which five steamers that it owns convey to the factories. The company has built 3,278 tenements for its employees, in which 16,200 persons live. The grain used in the bakeries that supply these people with bread is bought by agents of the company in large quantities, chiefly in Odessa, the Russian grain port. Four common schools and an industrial school for girls and women provide the elementary instruction needed by this city of factory hands.

There is every prospect that a second reconciliation is at hand between the German Government and the Papacy. Bismarck, despite his iron resolution, found it impossible to carry out his views as to the passage of new laws with the aid of the conservatives and liberals, as the latter were unwilling to pass some of the oppressive measures the Chancellor insisted upon. The Catholic vote in the Reichstadt is solid and counts 113, and so long as Bismarck's harsh measures against their Church were rigorously enforced, the Catholic vote was always against him. Latterly he has been temporizing, and that vote has several times come to his support, especially since his split with the liberals. Meanwhile, Leo XIII. seems to be of a more diplomatic turn of mind than Pius IX., and accordingly he has pressed negotiations with Bismarck with a view to the re-establishment of amity between the Empire and the Papacy. Dr. Falk, Minister of Public Worship, and author of the oppressive May laws against the Catholic priesthood, has just been forced to resign, a large number of banished and imprisoned ecclesiastics have been pardoned, the Catholic vote has been lately pretty solid for Bismarck, and already the chief terms of reconciliation are noised abroad. The fundamental points are: that the German Government should nominate all German Catholic bishops with the consent of the Pope, and that the bishops should nominate the priests to "livings" with the consent of the government. This is merely a rumor as yet, but is probably true.

There is a great deal of bitter indignation in England and indeed everywhere concerning the circumstances that led to the death of the Prince Imperial. Orders had been sent from home that he should not be exposed to danger; yet he was sent, or permitted to go, ahead with a small scouting party into an intricate district supposed to be infested with scattered parties of hostile natives. Moreover, when the little party were surprised by the "blacks" during their noonday rest, all took to horse at once, certain of escaping easily on horseback from the Zulus on foot, while no one seems to have noticed that the Prince's saddle had given way as he was mounting, or if any noticed it, they were too terrified to render him assistance. It's fortunate for France that his body was found, pierced by so many spears, for otherwise there would certainly be in the future more than one "claimant." The body is now on the way home. The ex-Empress is slowly recovering from the terrible prostration produced by the news of the sad end of her only and worshiped son. She has the sympathy of all hearts. The officer commanding the scouting party which abandoned the young man to his fate, is likely to receive the reward of his base cowardice from a court-martial. Lord Chelmsford and everybody connected with the Prince's death are blamed by the public. Prince Jerome Bonaparte—nick-named, Plon-Plon—will now probably be ranked head of the Bonapartes, and he is a decided republican. Meanwhile Cetawayo is still said to be negotiating for peace.

The Porte is trying, on the accession of the new Khedive, to revoke one of the concessions to the late ruler which enabled him to maintain fleets and armies and make treaties with foreign powers; but France and England have remonstrated against this, and the decree will probably be abrogated. The new Khedive; is only twenty-seven years old, and of course promises to reform every thing. The most marked incident attendant on his father's outgoing was the appearance of Germany among his coercers. This has excited genuine indignation among the English Liberals, and will probably have a serious effect on the Tory fortunes at the next election. Egypt ten years ago was looked on all over Europe as substantially a dependency of England, which she might without offence occupy at any time under the spirited foreign policy of the Tories. This position has been completely lost; France has been admitted to full partnership in Egypt, and now Germany has appeared on the scene claiming the right to a voice in the management of its affairs also, and Russia and Italy it is said will soon claim a voice in Egyptian matters.

From Constantinople there is a report and its contradiction, that ex-Sultan Murad has escaped. He was deposed in 1876, after a brief reign, on the ground that he was mentally incapable, and ever since has been closely imprisoned in the Tcheragan Palace. At Kieff, in Russia, there has been a recent execution of a large number of Nihilists. Just before it took place, 400 members of the association arrived there from different parts, some even from Western Europe, in order to attempt a rescue of the prisoners. The police, however, got wind of the intentions of the Nihilists and succeeded first in capturing quantities of dynamite and frustrating the attempt. Another despatch says that 400 Nihilists were arrested at Kieff on the night of the 26th of June, and a great store of weapons seized. Repressive measures of the severest nature are still continued against the organization, which seems to have members in every class and rank of society, official as well as non-official.

Murray & Lanman's Florida Water is probably the simplest and purest perfume ever made, being absolutely nothing more than the delicious fragrance of rare flowers, preserved and made permanent, and it is doubtless to this purity of composition that its immense popularity is in a great measure to be ascribed.

It is impossible to remain long sick or out of health where Hop Bitters are used.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 5th, 1879.

Were it not for a number of perishable items and our duty to keep our readers posted on the run of general quotations, we might omit market space this week. The spirit of celebration became so strong upon New York this Fourth that exchanges and important dealing were closed from Wednesday night to Monday morning, and trade affairs will have to be dismissed with brief allusion.

BEANS AND PEAS.—All grades light for consumption and export. Green peas, $1.75@$1.80; Southern B. E., $2.00 per 2 bush. bag. Canadian at 75c., bulk and bond. Marrow beans, prime, $1.35; fair to good, $1.25@1.32½; medium, prime, $1.30@1.32½; fair to good, $1.20@1.25 pea, $1.20@1.32½ white kidney, $1.35@1.40; do., red, $2.25@2.30; black, $2.25@2.30.

BROOM CORN.—Tone of market firm, with stock showing considerable reduction.

Brush and short broom, choice, ₹ lb, 5¼@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Receipts have fallen off, 56,950 packages for week against 42,750 last week; but, the surplus from previous heavy deliveries, coupled with the restricted demand, is of volume enough to weaken quotations; best grades, ½c. off. Good market styles of Western hold their own.

State pails and half tubs, choice, 13@13½c.; good to prime, 12@12½c.; fair to good, 10@12c.; firkins, choice yellow, 15c.; fair to good, 13@14c.; Welsh tubs, choice, 13@14c.; good to prime, 12@13c.; fair to good, 10@12c.; poor, 7@9c; State creamery, best invoices, 15½c.; good to prime, 14½@15c.; sweet cream, best, 15c.; fair to good, 14@15c.; Western, best invoices, 15½c.; good to prime, 15@15½c., fair to good, 14@15c.; imitation creamery, 11@12c.. Western dairy, best invoices, 10@11c.; good to prime, 9½@10c.; fair to good, 8½@9½c.; poor to fair, 7½@8½c.; Western, factory, best invoices, 10c.; good to prime, 9@9½c.; fair to good, 8@9c.; poor to fair, 7@8c.; grease butter, 3½@4½c.

Comparative receipts and exports for June, for past three years:—

1879, 18,991 received; 1878, 138,042 do.; 1877, 131,049 do. 1879, 37,538 firkins exported; 1878, 22,791 do.; 1877, 29,361 do.

COTTON—Quoted July 2d:

	Upl'd.	*N. Orl's.*
Ordinary	11	11 2-16
Good ordinary	11 12-16	11 14-16
Low middling	12 2-16	12 4-16
Middling	13 7-16	13 9-16
Good middling	12 12-16	12 14-16
Middling fair	13 11 16	13 13-16
Fair	14 11-16	14 13-16

CHEESE.—Improved quality has caused a better holding feeling, but up to the close shippers had very free access to stock at the low ruling rates.

Liverpool cable, 31s.

Comparative receipts and exports for June for the past three years:

1879, 308,614 boxes received; 1878, 455,641 do. 1877, 405,650 do.; 1879, 15,355,979 lbs. exported; 1878, 23,415,921 do.; 1877, 21,783,242 do.

State factory, full cream, fine colored, 5¾@6c.; fine white, 6c.; good to prime, 4½@5¾.; fair to good, 4@4½c.; half-skimmed, 3@4c.; skimmed, 2@3c.; farm dairy fine, 5½@5¾c. good to prime, 4¾@5¼c.; fair to good, 3½@4¼c.; skimmed, 2@2¼c. Western, factory, full cream, flat fine, 5@5½c.; good to prime, 4½@5¼c. fair to good, 4@4½c.; half-skimmed, 3 4c.; skimmed, 1½@2½c.; full cream, Western cheddar, 6c.

DRIED FRUITS.—Market generally quiet; apples seldom touch outside rates. Best peaches are being stored in the absence of demand.

Apples, Southern, sliced, 2¼@3¼c; quarts, 2@2½c.; evaporated, fancy, in boxes, 10@11c.; fair to good 8@9c; State, sliced, good to prime, 2¾@3½c.; quarters, 2½@3c.; Western, quarters, 2½@3½c.; quarters, 1877, 1½@1¾c. Peaches, N. C., peeled, choice, 9@10c.; good to prime, 7½@8½c.; Georgia, peeled, choice, 8@9c.; peeled fair to good, 6 7c.; peeled, pr. to fair, 5@6c.; unpeeled, halves, 3@3½c.; quarters, 3c. Plums, State, black, 8@10c. Blackberries, 1878, prime, 4½@5c.

EGGS.—Receipts for week, 8,129 bbls.; do., last week, 7,849 do. Liberal supplies check buoyancy. Wholesale trade in Western is now "less off." Canadian on account of even quality are rather firm. Near points scarce. The market has missed the usual spurt of activity incident to Fourth of July week.

Near points, 14@15c.; State and Penn., 12@12½c.; Western, prime, 11c.; poor, 10@10½c.; Canadian, 11½c.

FLOUR.—The market closed active on the 3d, at the following rates:

Flour, No 2, per 196 lbs., $2.50@3.30; superfine State and Western $3.50@3.30; shipping extra State, etc., $4.05@4.20 Western spring X, $4.00@4.30; Western spring XX and XXX, $4.40@6; "patent" Minnesota, $5.50@8; Wisconsin and Minn. premixed, $4.20@4.40; Western winter shipping X, $4.35@4.65; Western XX an XXX, $4.75@6; city shipping extras and fancies, $4.15@5.30; Southern shipping extras, $4.50@5; do., bakers' and family brands, $5.25@6.25; rye flour—superfine State, $3.20@3.50; corn meal—Western, etc., $1.90@2.35; do, Brandywine, $2.50@2.55.

FRESH FRUITS.—This week finds up strawberries, Raspberries very plenty and nominally low. Currants scarce. Cherries in temporary good supply, with fine table sorts coming from Rochester. Peanuts in fair demand, that is, none accumulate. Apples, Red Astrachan, per bush. crate, $1@1.25; Early Harvest, Southern choice, per bbl., $2@2.50; common, green, per bbl., $1@1.50 Strawberries, Oswego, per qt., 6@10c.; Oneida and Rochester, 5@7c. Cherries, sweet, fair to prime, per lb., 5@8c.; common, 3@5c.; sour, choice, 6@7c; fair to good, 4@4c. Currants, cherry, per lb., 7@9c.; small, fair to good, 5@6c Gooseberries, choice, green, per bbl., $3@6. Whortleberries, Md. & Del., fair to good, per qt., 5@7c. Jersey, fair to good, per 14 qt. box $1; mountain, do., $1 25@1.50. Blackberries, Md. & Del., Wilson, ₹ qt., 11@1 c.; do., Dorchester, 9@10c.; do., wild, 4 5c. Raspberries, Up-river, Antwerp, per 3 to qt. cups, 4@5c.; do., do., native, 2½@3c.; Jersey, Black cap, per pint, 3@4c.; Md. & Del. Brandywine, 4@6c. Watermelons, Fla., per 100, $18@30. Peaches, Georgia, per ½ bush. crate, $2.50@3.50 N. Carolina, Hales' Early, per bush., $1.50@2.00; Md., per crate, $3.50 4. Plums, Damson, Ga., per ½ bush. crate, $3.50@3; do., goose, $2.50@3, Tenn., $3.50@4; Del. bench, $1@1.25. Hot-house grapes, Hamburgh, ₹ lb., $1; Muscat, $1; Sweet Water, 50c. Peanuts, Va. hand-picked, $1.40@1 45; other, $1.20@1.30; shelled, 5½@5¾c.

GRAIN.—Unfavorable crop reports gave wheat prices an upward tone on the 3d, and there was a good business at the following quotation: $1.17@1.17½ for No. 3 red, $1.13½ for steamer do., $1.11½ for ungraded red, $1.14½@1.15¾ for No. 1 white, $1.09 for white Canada in bond, $1.16 for extra white, 98c.@$1.03 for ungraded spring, including Duluth at $1.03; $1.06@1.07 for No. 2 spring, 95½c. for No 3 spring (94c. for do. to arrive) and $1.14½ for ungraded amber. Futures at $1.14½ for No. 2 red for July, $1.09@1.09¾ for do. for Aug., $1.09 for do. for Sept., $1. 4½@1.15 for No. 1 white for July and $1.15½ for do. for Aug. Corn was ¾@¾c. higher, but quiet at the advance. Sales, 105,000 bus. at 20c. for No. 2 white, 45½c for yellow, 43½@43¾c. for No. 2 mixed, 43c. for steamer do. and 41@43½c. for ungraded do. For future, sales of 104,000 bus. at 43¾c. for No. 2 mixed for July and 15c. for do. for Aug. Rye was steady. State sold at 61c., Canada quoted at 64c. and Western at 60@61½c. Oats were quiet but firm. Western and State mixed at 38@39½c.; do. white, 38½@42½c.; No. 2 mixed, 38@39½c.; No. 2 white, 39½@40c.; No. 2 Chicago at 39¼@39¾c.

HAY AND STRAW.—Sales light, and will be until fireworks cease to give buyers anxiety. New hay not coming forward to any extent.

Hay, prime timothy, per 100 lbs., 75@80c.; medium, 55@70c; shipping grades, 40@50c.; clover, good, 45@50c; inferior, 35@40c. Straw, No. 1 rye, 50@55c.; No. 2 rye, 35@45c. Oat straw, 35c.

HOPS.—Offering light; demand directed to choice, and mainly at present for brewers. Northern State counties report well on the coming crop. English advices on growths not favorable.

CROP OF 1878—State, strictly choice, 12@13c.; good to prime, 9@10c.; fair to good, 7@9c.; poor to fair, 5@7c.; 1877—good to prime, 3@5c.; poor to good, 2@3c.

POULTRY AND GAME.—Live chickens in demand; Fowls dull. Spring ducks, 62@87c. @ pair.

Chickens, best, per lb., 17@18c.; small, 14@15c., fowls, N. J., 10½@11c.; Western, 10@10½c.; Southern 10c; roosters, old, 5@6c.; turkeys, 8@9½c.; ducks, choice, ₹ pair, 60@70c.; others, 30@45c; Geese, N. J., Pa. and State, $1.25@1.50, others, 75c.@$1.12; pigeons, 35@40c.

Excursions and near-by watering places will use a good many chickens this week, and they have sold well. Other items dull and easy.

Turkeys, prime small, 11@12c.; fair to good large, 10@11c.; chickens, Phila., large, ₹ lb, 23@35c.; small, 20@22c; State, 18 20c.; Western, 15@17c. Fowls, N. J., choice, ₹ lb., 12@13c. State and Western, dry-picked, 11@12c.; scalded, 10@11c. Phila. dry-picked, 13@14c.; ducks, spring, Phila. dry-picked, 18@20c ₹ lb; spring, small, 14@15c; old, Phila. dry-picked, 11@12c.

Game is hardly represented. A few ice-house Eng. snipe quoted at $2.25 ₹ doz.; plover, $2; small snipe, 50 60c.; stall-fed pigeons, $1.75; baited, $1.50; Frogs' hind legs, 12@2 c. ₹ lb.

PROVISIONS.—A good tone pervaded the market at the close of 'Change on the 3d, sales supporting annexed rates.

Pork—Mess, Western old, per bbl., $9.25@9.50; do. new, $10@10.25; prime new $9.75@10; extra do., do., $8.50@8.75. Lard—Steam Western, per 100 lbs., $6.37½@6.40; prime city, $6.5@6.27½. Hams—Smoked city, per lb., 9¾@10½c.; pickled, Western and city, 9@9½c. Shoulders—Smoked, city, 5½@5¾c.; pickled, 4¾@4¾c. Rib bellies, pickled, @6c. Bacon—Long clear, Western and city, 5¾@5¾c. Beef—Western, plain mess, $9.50@10.50; extra do., $10.50@11.50. Beef hams, per bbl., $17 50@18.25.

Stearine, 7¾@7¾c.

Tallow, prime, 6c.

RICE.—Fair to prime Carolina, 7¼@7¾c.

TOBACCO.—Seed leaf slow, and sales for the week are only 81 cases, all old crops, and mostly New England of 1877 at 9@35c., and Pennsylvania of 1877 at 13@20. Kentucky leaf quiet; sales for the week, 75 hhds for export and 275 hhds for consumption; total, 350 hhds. Prices steady and firm; lugs, 3@5c., and leaf, 5½@12c.

VEGETABLES.—Demand fair for prime potatoes; poor or State schooner lots slow of sale: Bermuda, ₹ bbl., $4; L. I., $2. 0@3; Norfolk, extra, $3.25; poor $2@2 50; culls, 50@75c. Cucumbers, L. I., ₹ 100, 75c.@$1; Norfolk, ₹ crate, 50c. Tomatoes, Norfolk, ₹ bu. crate, $1.50@$1.75; Savannah, per bu. crate, $1.25@$1.50; Florida, per bu. crate, $1@1.50. Egg Plant, Florida, per doz., $1@1.75. Beans, L. I., wax, per bag, 75c.@$1; round, per bag, 75c; flat do, 40@50c. Squash, L. I., yellow, per bbl, $2@2.50 white, do., $1. Green peas, L. I., per bag, 75c.@$1.25. Cabbage, Jersey, per 100, $2@5. Onions, Va. and Md., per bbl., $1.50@4; Bermuda, per crate, $1.50@1.75. Beets, Jersey, per 100 bunches, $1@1.25. Russia turnips, per bbl., $1@1.25; Jersey, new, per 100 bunches, $1.50@2.50. Carrots, per 100 bchs., $1@1.25. Cauliflower, ₹ bbl., $3.50@5.

WOOL.—Market quiet, with about former prices repeated:

Ohio, Pennsylvania and West Virginia—X to XX, 38@40c.. No. 2 to No. 1, 36@42c.; coarse, 34@36c.; combing, 38@40c.

State and Western—X to XX, 36@38c; No. 2 to No. 1, 35@40c.; coarse, 33@35c.; combing, 38@42c.; combing unwashed, 30@36c.

Southern—Medium, unwashed, 30@34c; fine, do., 25@28c.; coarse, do., 23@27c.; burry, 15@22c

California—Spring, good to choice free, 26@32c.; do., fair, 22@25c, do, burry to slightly burry, 20@22c.; fall, fair to good, 17@20c; do., inferior, 13@16c.

Texas—Spring, good to choice free, 26@30c.; do., fair, 20@25c: do, burry to slightly burry, 15@20c.; fall, fair to good, 15 19c; do., inferior, 13@15.

Pulled—Super, 35@40c.; extra, 34@38c.: No. 1, 20@23c.; lambs, @40c.

Tub-washed wools, 35@40c.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 5.

BEEVES.—The celebration of the Fourth has interrupted the entire cattle market for the past three days. The week has been a hot one and sales of dressed beef have been very slow; in order to close out at the Washington market books, the low range of 5¾@6¼c. was accepted for dressed quarters on Thursday. At the close quotations for dressed are indefinite, as buyers will do little until the demand becomes steady. Wednesday's quotations for live, 7@10¼c. general sales at 8@9¼c; fat cows 7¼c.; only extra steers brought 9¾@1 ¼c In cows there is no trade to note; range, $30@50, ordinary to good. Veal of all grades quiet; lean stock specially so. Best N. J. quoted on Thursday, 5¾@5½c; other 3½@4¼c.; buttermilk, 2@3c. Sheep and lambs in moderate demand at 3¾@4¾c. Poor Canada lambs, 4¾c. Western, State and Southern, 7@7½c. Live hogs nominally, $4@4.20 per 100 lbs. City dressed, $5.25@5.75 do.

A LESSON IN LEAVES.

UNCLE MARK.

THE leaves constitute an important part of our plants. They have functions which are most essential to plant life, and they render such valuable service to man, not only by furnishing food for animals, by absorbing noxious gases, etc., but by beautifying the world with their lovely green and their endless variety of size and shape, that they deserve our special attention and study. Moreover, leaves occur so plentifully everywhere in nature, that the observer has no difficulty in finding "specimens" to study, and, of all botanical subjects, the leaf is one of the easiest to understand, and one that must be understood before the pupil can make much advancement in the study of botany; for these reasons I have chosen leaves for our first lesson.

On examining a leaf we find that it is made up, first, of ribs, or veins, which form the skeleton, or frame-work, of the leaf, and that, second, the spaces between the veins are filled with a softer and more brittle material than the veins; this is in botanical language termed *parenchyma*.

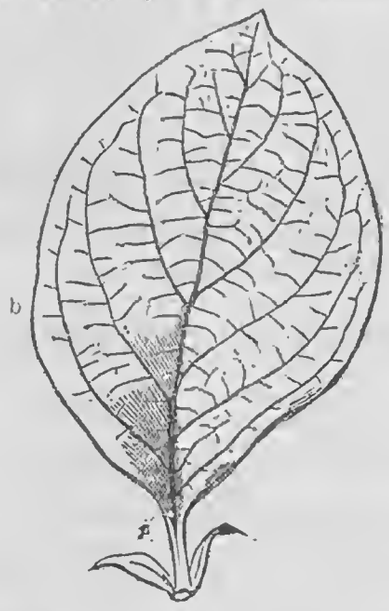

FIG. 1.

All leaves are divided into two great classes according to their *venation*, or the manner in which the veins are distributed through the leaf, namely, *parallel-veined* leaves and *net-veined* leaves. These two forms of venation represent the two great divisions of the vegetable kingdom, the *endogens* and the *exogens*, (I wish you would remember these terms, as they denote the primary classification of all plants) which terms relate to the manner of growth of the two classes of plants, the endogens increasing in thickness from *within*, while the exogens increase in thickness by annual layers added to the *outside* of the trunk. Further, all endogens when they germinate have but *one* seed-leaf, while the exogens have *two* seed-leaves. But, to return to our leaves, parallel-veined leaves are those in which the veins run in the same direction, or parallel with one another as is the case in Indian corn, the grains and in all the grasses; these are therefore endogens.

FIG. 4.

The net-veined leaves are those in which the veins do not run in the same direction, but curve about and spread out to all portions of the leaf. This kind of leaves you will find in all our trees, shrubs, and in all plants with two seed-leaves, in other words in all exogens.

Leaving the parallel-veined leaves, as little can be said about them that will be of value to you at present, we will now take up

The Net-Veined Leaves.

A complete leaf consists of three parts as may be seen in figure 1, the *petiole*, or leaf stalk, p, the expanded portion called the *blade* or *lamina*, b, and the two little wing-like appendages, seen at the base of the petiole, which are called the *stipules*. Each of these may, indeed, be modified or be entirely wanting, but we will not at present discuss such modifications. The net-veined leaves are further divided according to the position of the veins into two groups, of which I shall first mention

Feather-Veined Leaves

or, more technically, *pinnately-veined* leaves, so called from their resemblance to a feather. Fig. 1 is an example of such a leaf, and the leaves of the Chestnut and the Beech are other good examples. In this leaf you will notice that a strong, heavy vein, forming a continuation of the petiole, runs through the whole length of the blade from the *base* to the *apex*, and divides it into two parts, which, however, are not always equal in size. This vein is called the *midvein* and from it, on both sides, proceed a number of smaller veins which again branch, the branches often uniting with one another (anastomosing), forming numerous small meshes which are filled with the parenchyma mentioned above. The second group of net-veined leaves is represented by fig. 2, which is a

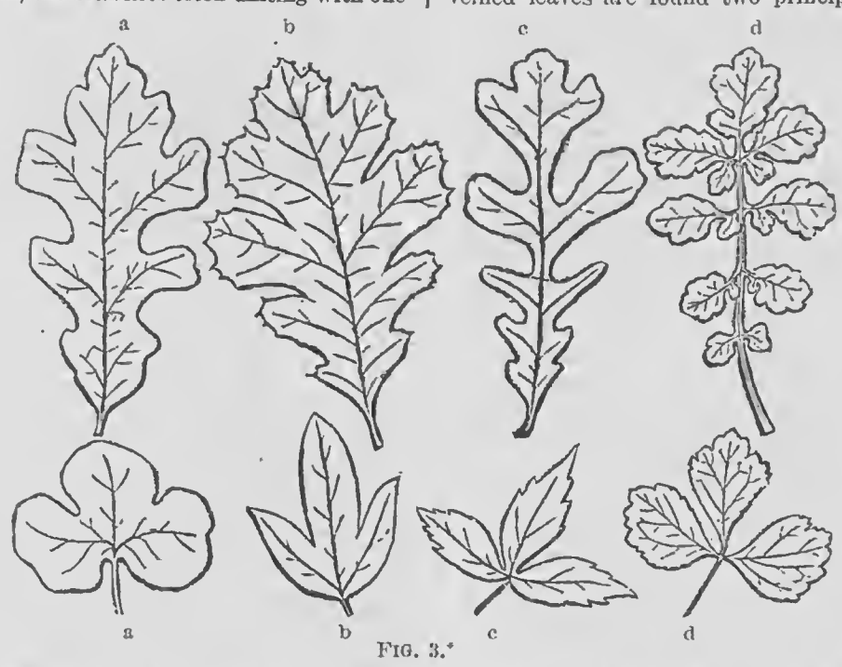

FIG. 3.*

Palmately-Veined Leaf,

having received that name from the resemblance it bears to a hand with the fingers spread. Instead of having a strong midvein from which all the side veins proceed as in the preceding case, we find that in this class of leaves several large veins all radiate from one point at the base of the blade. It is still a net-veined leaf, and it shows the anastomosis of the *veinlets* perfectly, but it differs from the feather-veined leaf in the disposition of the larger veins. The leaves of the Geranium, the Hollyhock and many others are good examples of palmately-veined leaves.

So far we have discussed only simple leaves, or those consisting of a single blade, as distinguished from compound leaves or those made up of several pieces. By referring to Fig. 3 we notice that there is a gradual transition from the simple to the compound form of both pinnately and palmately-veined leaves. When a simple leaf is notched as those on the left hand, a a, Fig. 3, it is called *lobed*; cut a little deeper as b b, it becomes a *cleft* leaf; notched deeper still as c c, it is *parted*, and *divided* d, d, when the incision reaches to the midvein. This brings us to the subject of

FIG. 5.

Compound Leaves,

in which the blade is divided into a greater or less number of smaller blades, each of which is called a *leaflet*. The rose leaf in Fig. 4 is a compound *pinnate* leaf, and as it terminates in one leaflet it is an odd-pinnate leaf. Fig. 5 is a *twice-pinnate* leaf, and having two leaflets at each extremity, it is termed an equally-pinnate leaf. Sometimes the leaflets have a pair of *stipels* at the base of each, which answer to the stipules mentioned above as appearing at the base of the petiole. Fig. 6 is a *palmate* leaf of the Virginia Creeper, compound, but the leaflets radiate from one point like the veins in a palmately-veined leaf.

Now, to recapitulate: I stated first that there are two great divisions of leaves—parallel-veined and net-veined leaves, which represent the two sub-kingdoms, exogens and endogens. (There is still another class—fork-veined leaves, found in ferns and other cryptogams, but it is not important, so I have said nothing about it). In the net-veined leaves are found two principal forms of venation—feather-veined and palmately-veined. The parts of a leaf—petiole, blade and stipules. The feather-veined leaf has one strong vein, the midvein. In the palmately-veined leaf all the principal veins radiate from one point. Simple leaves are lobed, cleft, parted and divided, the latter

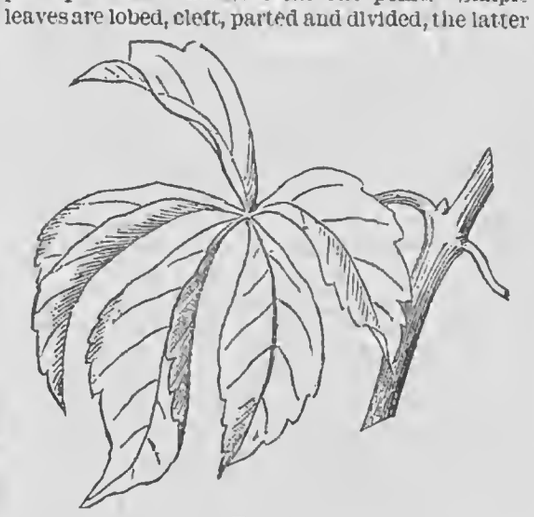

FIG. 6.

makes them compound. Two forms of compound leaves, pinnate and palmate; parts of same, stipules, petiole, leaflets and stipels.

A great deal more remains to be said on the subject of leaves, but I fear this lesson would be too long if I should add any more. What I have said may enable you to get a general idea of the venation and classification of leaves, but even this it cannot do unless you *study* the subject and commit the names to memory. Do not persuade yourselves that the names are hard to learn, for that is not the case. Scores of words that you use in your every day speech without thinking anything of it are much more difficult both of spelling and pronunciation than any of these. But in order to study botany with any success, whatever, it is not enough to learn a lesson from a book or a paper; you must study specimens from nature. Make a collection of different kinds of leaves and try to classify them according to the above descriptions. You will learn more in one thorough lesson of this kind than you could learn in a month from the book alone.

IS FAITH BLIND?

THE following words of an eminent divine not long dead are quoted with high commendation in an obituary, as setting forth the central idea of his religious belief:

"The first and most indispensable condition of piety is submission—blind, absolute, entire submission of the intellect, the conscience, the life, to God. This is blind, but not irrational. It is the submission of a sightless child to an all-seeing Father; of a feeble, beclouded intelligence to the Infinite Intelligence."

What is meant by a "blind, absolute, entire submission of the intellect" to God? What is the intellect? It is the faculty or faculties by which we apprehend truth. If God made the intellect, that is what he made it for. When a visible object is placed before the open eye, the eye perceives the object. When intelligible truth is placed before the intellect, the intellect perceives the truth. That is the function of the intellect. There is no more reason, therefore, for a "blind, absolute, entire submission" of the mental vision than of the physical vision to God.

We take it for granted that the physical sight was given us to see with; that we honor the Giver not by disusing it, or by speaking contemptuously of it, but by using it and prizing it. We suppose that it is by keeping our eyes open and trusting the evidence they give us that we walk most safely. What sort of sense would there be in talking about a *blind* submission of the eyesight to God? It might mean keeping the eyes closed and only opening them when we are supernaturally admonished to do so. A man might imagine that he was honoring God in the use of his eyes by shutting them, and refusing to open them at all unless miraculously ordered to open them. Blind submission of the eyesight to God might also mean a persistent refusal to believe our eyes. A man might say, "My eyes tell me that that is a tree before my face, but I shall not rely upon their report. If God gives me some miraculous reason for believing that it is a tree I will believe that it is a tree; if, on the other hand, He gives me some supernatural assurance that the thing which looks like a tree is a house I will believe that it is a house. To rely upon the evidence of my eyes in a matter like this would be presumptuous; 'blind, absolute, entire submission' of the eyesight to God is the only safe rule."

That would be curious reasoning respecting the bodily senses. That would be a strange way of showing our respect for Him who gave us these organs of vision. We may well ask Him to show us how to use our eyes, and to help us to understand the meaning of the things we see; but to assume that the eyes which He has given us to see with cannot be trusted is a strange way of expressing our confidence in Him. Would not a wide-awake and open-eyed use of the power to see evince a truer reverence and a more genuine faith than a blind submission of this faculty to God, whatever that may mean?

Now we fail to see any reason why this argument does not apply just as well to the mental sight as to the bodily sight. The intellect was made to be used just as truly as the eyes were. We do not honor God by disusing it or by distrusting it any more than we honor him by disusing or distrusting our eyes. The intellect is not infallible; it sometimes falls into error, but so do our eyes sometimes deceive us; we keep on using and trusting our eyes, and we have just as much reason to keep on using and trusting our intellects. There are many subjects of thought that are beyond the comprehension of our minds, and there are many objects in the universe that are too far away or too small for our eyes to see; but that is no reason why we may not see and know things that come within the range of sight or knowledge. We need the help of the Infinite Wisdom in using our mental vision, and in understanding the things that we see and their relations—but it is *in using* the mind's eye, and not in closing it, nor in refusing to accept without supernatural indorsement the evidence that it gives us that we prove our reverence and our faith.

But this divine goes on to say that such submission is "blind but not irrational." If it is not irrational to shut the eye that was made for seeing, what is irrational?

It is, however, a "sightless" eye. That seems to alter the case. Man is the "sightless child" of an "all-seeing Father." It must be mental vision that is here denied to man. To say that he is sightless is the same as to say that he is destitute of intellect. Of course, if he has no intellect it may be well for him blindly and absolutely and entirely to submit his intellect to God if he can. But how can he? How is it possible to submit to God that which he does not possess?

This statement, however, appears to be too strong, and it is qualified in the next sentence. It is not a creature absolutely sightless, but a "feeble, beclouded intelligence" that is called thus to submit itself. If an intelligence is "feeble and beclouded," then, the only right thing for it to do is blindly and absolutely to submit itself to God. We do not believe that God desires that any intelligence should do anything of the kind. No matter how feeble our powers may be, God wants us to *use* them, diligently and trustfully; he does not want us to disown them or despise them. The feeblest mental powers are invigorated by exercise. Faithful use, not blind submission, is their proper regimen. "The word "blind" has no application to any intellectual act required of men by God. It is casting contempt upon His most precious gift to speak of the mind of man in the tone in which it is spoken of in this extract. If God had wanted blind votaries he would not have given us minds. We prove our faith in Him not by reviling but by using the faculties that He has given us.—*Sunday Afternoon.*

RELIGION is the best armor that a man can have, but it is the worst cloak.—*Bunyan*

PERSONAL ITEMS.

Ivan Tourguenieff, the Russian novelist, and Mr. John Ruskin are among those honored with the D. C. L. from the University of Oxford this year.

A. J. Myer, "Old Probabilities," is in London, arranging with the British Meteorological office matters of common interest between the United States and England.

Cadet Midshipman Andrew Cunningham, of Mohawk, bears off the palm from the United States Naval Academy as being the most expert swordsman that ever graduated.

Ex-Senator Dorsey of Arkansas is said to have made $200,000 in recent lucky stock speculations, and he proposes to get rid of it by starting a republican Daily at Little Rock.

Emperor William insisted upon a good old-fashioned kiss from the ladies and children at the Royal golden wedding. Kissing his hand did not satisfy him for so extraordinary an occasion.

General Justice Hodge, of Riverton, Conn., has just bought 320 acres of land in Wabaunsee county, Kansas, at the very spot where he encamped while with General Fremont in the famous overland trip of 1846.

When Mrs. E. Heath, of Sherman, Maine, was born the house took fire; at the time of her marriage the house again took fire, and last Sunday week, at the birth of her first son the house again took fire.

Ex-Governor Tilden's summer home at Yonkers is known as "Greystone." The grounds cover thirty-three acres, including lawn, meadow and forest. The manston and grounds, which are leased by Mr. Tilden, cost $400,000.

The New York Sun, a part of whose stock is held by a brother of Senator Conkling, has published a studied and authoritative denial of the report that Mrs. Conkling had instituted proceedings for divorce, a report which was probably as cruel as it was false.

L. J. Jennings, once editor of the New York Times, now London correspondent of the New York World, a hard-headed man with strong Tory proclivities and no love for the liberal party, predicts Gladstone's return to power before many months, and notes his increasing popularity with London audiences.

Ivan Tourguenieff, the Russian novelist, is a man of imposing figure. His tall figure is slightly bent, his hair is silvery, his manners are delightful. It is stated that he has been obliged to naturalize himself a Frenchman to escape the vindictivenss of his own government, which objects to his graphic novels.

The Duke of Hamilton has brought an action against Mr. Padwick, the well-known turfman, for many years His Grace's agent, alleging that the debts upon his estates increased from £300,000 to £1,500,000 during the time that Mr. Padwick administered them. At present all the Duke's property is applied to the benefit of the creditors.

The Duke of Argyle having been with some ladies in the opera house in London, an English squire, puffing, blowing, and sweating, entered the box in which they were seated with his hunting boots and whip in hand. The Duke instantly rose up, and making a low bow exclaimed, "Sir, I am very much obliged to you." "Oh! why?—how?—for what?" "For not bringing your horse here."

Mrs. Parker (*nee* Julia Smith, of Glastonbury, Conn.), still firmly adheres to her principles, and has had her cows seized once more for her taxes. Her husband asked the amount of the taxes and costs, and, being told $87.67, bid $87.57 for the cows, which were knocked down to him, and he and his bride departed happy in the consciousness that they asserted their principles at the expense of $14 costs.

Mr. Charles J. Bonaparte, of Baltimore, although now made independently wealthy by the inheritance of much of his grandmother's hoardings, still works hard in his law practice and displays great ability therein. He thinks, now that the Prince Imperial is dead, that the Napoleonic dynasty never will be restored. Mr. Bonaparte has apparently no aspirations in the direction of the French throne.

Richard Henry Anderson, a lieutenant-general in the Confederate army, died at Beaufort, S. C., on Thursday, of apoplexy. He was born in South Carolina, graduated at West Point in 1842, and served with honor in the Mexican war. In 1861 he became a brigadier-general in the Confederate service, was a major-general and commanded a division at Gettysburg in 1863, and finally rose to the rank of lieutenant-general.

Ex-President Grant is *en route* from Tien-tsin to Peking, China. The latest advices indicate a considerable change in his future movements. It is now believed probable that he may return to China after visiting Japan, and proceed to Australia. His plans are subject to so many alterations, however, that nothing absolutely certain is known a month in advance. Prince Henry of Germany, who is visiting Japan, is receiving the most lavish hospitality at Yokohama, but the greatest manifestations are reserved for General Grant, who will be greeted with honors never before vouchsafed to any guest of Japan.

The ex-Bishop of Zululand, now an English Rector, says that the Zulu war is entirely the act of Cetywayo, and that in his subjects he found no hostility to the English. Thousands of Zulus, he thinks, would be glad to escape from the thraldom of their King. This bears out the experience of travelers thirty years ago. The King liked to talk to the Bishop of the slaughtering powers of his army, and the strength and constitution of that of the British, and was evidently calculating whether he would be strong enough to attack. The Bishop thinks that Cetywayo went to war because he found himself gradually surrounded by British interests.

Detective Gottlieb Miller of Allegheny City, was much shocked on Wednesday to receive a letter from Colonel Robert G. Ingersoll. Gottlieb read from the letter: "I have gone over the ground to the best of my ability long ago and there is just as much probability of my becoming a believer in the religion of ancient Egypt as in Christianity." "Mein Gott, who ish dot Ingersoll?" exclaimed Gottlieb, opening his eyes. But he read on: "Let me prophesy—in five years from to-day no man of intelligence in the United States will preach the infamous doctrine of eternal punishment." Gottlieb did not know what to make of the matter until some of his fellows admitted that they had written to the Illinois Iconoclast in the detective's name, asking whether it was true as reported that "within a year Colonel Ingersoll would be a preacher of the Gospel."

The greatest nourishing tonic, appetizer, strengthener and curative on earth. Hop Bitters.

18 ELEGANT New Style Chromo Cards with name, 10c. postpaid. Geo. I. Reed & Co., Nassau, N. Y.

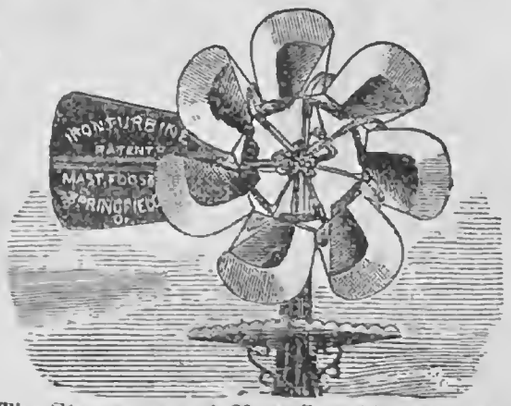
Implements and Machinery.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO.,
BUCHANAN, MICH.

NEW IRON TURBINE

WIND ENGINE



The Strongest and Most Durable Wind Engine in the World. Sold by Dealers in nearly every County. Inquire for it. Every Wind Engine Fully Warranted.

Send for Circulars, Price-List and information to

Stock and Poultry.

THOROUGHBRED Cattle, Sheep, Hogs, Poultry and Dogs. New Illustrated Catalogue FREE. W. ATLEE BURPEE & CO., P. O. Box 1890. 221 Church St., Philada., Pa.

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publish to mention the source of your information—other words, to mention the paper.

Wit and Humor.

Cannibalism.—A Charleston, S. C., paper advertises: "Wanted—A stout colored boy, to cook."

It is lucky to pick up a horse-shoe, unless, of course, it happens to be attached to a mule's hind leg.

We know a man of over ninety years of age who hasn't a gray hair on his head—nor one of any other color.

Oh, but this is a peculiar language! We use dusters to catch the dust and dusters to brush the dust away.—[Puck.

A little Sunday school miss was asked by her teacher, "What must people do in order to go to heaven?" "Die, I suppose," replied the little one. The teacher didn't question her any further.

There was a clever Oakland boy who, when he was given $2 to dig up his aunt's garden, hid a two-bit piece in it, and then told all the boys in the neighborhood. The next morning the ground was pulverized two feet.—*San Francisco Post.*

A good little boy tried to persuade his father that a cigar is a very dangerous thing. "Why, papa," he said, in the enthusiasm of his youth, "you have no idea how powerful nicotine is; why, if you put a single drop on a dog's nose, it will kill a man in less than two minutes!"

A little girl, meeting a countryman with a load of slaughtered swine, dropped a courtesy. The rustic laughed without returning the civility. "What!" said he, "do you courtesy to dead hogs?" "No, sir," promptly responded the little miss, "I courtesied to the live one."

Beside a straw stack sat a tramp—a jolly tramp, and wise—who, while he patched his tattered coat, did thus soliloquize: "It seems so sad that my lone life doth ever downward tend, and rags me into wretchedness; but still I'm on the mend. And when I needle little cash, I make no loud laments, but by a straw stack sit me down, and gather in my rents."

Frederick William IV, of Prussia, once upon a time stopped at a little railroad station where a deputation, headed by the mayor of the adjacent village, awaited him with an address. Just as the mayor braced himself up to deliver his oration, "a neighboring ass did sing both loud and clear." A frightful silence ensued, but the King did not long delay in breaking it with the paternal and graceful remark: "One at a time, gentlemen; one at a time."—*Paris Paper.*

One Word Covers the Advice

Which should be given to nervous, slender, and debilitated persons—*Invigorate!* Sedatives, opiates, appetizers, are comparatively useless. The system must be built up with a genuine tonic in order to the recovery of vigor and tranquility by the nerves. A course, systematically pursued, of the leading invigorant, Hostetter's Stomach Bitters, should be resorted to by those who suffer from weak nerves and general debility. The stomach, always more or less dyspeptic in cases of nervousness and loss of vitality, is toned and regulated by this medicine until the organ acts with a precision akin to that of a steady-going piece of mechanism. Complete digestion and assimilation are, through the influence of the Bitters followed by a gain of vigor and flesh, and the disappearance of biliousness and irregularity of the bowels, where such exist, as they usually do. Appetite and sleep are then regained.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 29.
WHOLE No. 1538.

NEW YORK, JULY 19, 1879.

PRICE FIVE CENTS.
$4.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington. — Entered at the Post-Office at New York City, N. Y., as second-class matter.]

AMELANCHIER CANADENSIS, VAR. ALNIFOLIA. (DWARF JUNEBERRY.) See next page.

Farm Topics.

NOTES FROM THE RURAL GROUNDS.

Amelanchier Canadensis, var. Alnifolia. (Dwarf Juneberry.)

[See first Page for Illustration.]

We have had a single plant of the Dwarf Juneberry for five years and the more we see of it, the more we like it. In bloom it is as pretty as many of the Spiræas which throng every garden, and in fruit it is one of the most luscious-looking shrubs in cultivation. Now, when we can procure ornamental plants—whether shrubs or trees—that are in every way as ornamental as those which do not bear edible fruit, why not give them the preference? Exochorda (Spiræa) grandiflora is a shrub everywhere praised for its beauty. Its flowers are larger than those of our Dwarf Juneberry, and it grows to twice the size, being, indeed, when fully grown, a small tree. But in other respects it is in no wise superior. The leaves of both plants are similar, resembling those of the Pear. Now, the Dwarf Juneberry is in fruit far more attractive than Spiræa grandiflora is in bloom, so that counting the fruit as worthless, we should still prefer the former, could we have but one. But the fruit is edible. It is sweet and juicy, and while twice the size of huckleberries, is not inferior to them. It begins to ripen the latter part of June, and continues for ten days or more. The berries or pomes or berry-like pomes, are first green, then nearly white, then red, then purple and finally, when fully ripe, a dark blue. Often all of these colors are seen upon a single raceme and our readers may judge for themselves that when, as at present (July 2), in the specimen before us, a peck or more of this fruit is ripening upon a single bush, not over five feet high or in diameter, it is as ornamental as any plant can well be. We have compared Spiræa (Exochorda) grandiflora with the Juneberry, because, bearing a decided resemblance to each other, the less meritorious is praised right and left, and engravings of it or colored plates appear from time to time in our leading horticultural miscellany, while the more meritorious (as we think) is seldom cultivated or noticed.

Amelanchier Canadensis, the botanical name of the Juneberry, varies remarkably. Gray gives half a dozen different varieties of which ours most nearly resembles Alnifolia. We have just selected leaves to show their dissimilarity, and we find the following forms or outlines; orbicular, ovate, oval, obovate, oblanceolate, spatulate, oblong and elliptical. All are mucronate—some nearly entire, some finely, some coarsely serrated—some serrated only near the apex, some half way, some entirely down to the petiole. Our drawing of a branch was made July 5.

Pen Fancies.

It is sometimes hard to account for the singular fancies that are entertained by those who purchase seeds. One of these is that green seed peas are better than buff seed peas. The difference is, that the former are gathered before they are fully ripe, so that they afterward maintain a greenish, fresh appearance, while the latter are gathered not until fully ripened. It is known to all experienced seedsmen that a larger proportion of the buff, bleached or whitened seeds will germinate; that they produce stronger plants, and that they are less liable to rot in the ground. Nevertheless, the demand is for the green seed, and seedsmen order their stocks accordingly.

So, with regard to weevil-eaten peas. This question is as old as the question whether wheat does or may turn to chess, and older, for aught we know. We have asked the question of at least fifty farmers: "What proportion of weevil-eaten peas will grow?" and we have received the same answer from *every one*, strange as it may appear to the thoughtful reader: "All will grow." Our late experiments, No. 2 of which we now place before our readers, show that the vegetative powers of all weevil-eaten peas are weakened; that the proportion which will germinate depends upon the injury that the cotyledons have sustained, and that this depends upon the age and size of the pea.

Will Weevil-Eaten Peas Grow? Experiment No. 2.

One hundred weevil-eaten peas were planted in a drill, nearly three inches deep, on the afternoon of June 23. The peas had been soaked in water for several hours previously. The variety was Philadelphia or one closely resembling it. The soil was moist and rich and we have since had sufficient rain to keep it so. July 10—17 days—but one pea had appeared above the ground and that looked as if it needed a doctor.

Standard Currants and Gooseberries.

Many of our readers will remember the Standard Gooseberries and Currants that were exhibited at the Centennial. These were grafted upon stocks of the Missouri Currant four or five feet high. Laden with fruit, they attracted much notice. Four years ago we purchased six of these plants. Two of them were half-standards; that is, the stocks were about two and a-half feet high. One of these was grafted to Currants; the other to both Gooseberries and Currants. The rest were full standards, two grafted to Gooseberries, one to Currants and one to both.

The Currants grow finely and bear well. A currant bush growing upon a perfectly straight and slender stem, five feet high, and loaded with its bright red fruit may be conceived as a very curious and pleasing object. But the Gooseberries mildew, both leaves and fruit, so that they just manage to live, and that is all. A few days ago, however, we saw in the grounds of a neighbor, five miles distant, these same standard Gooseberries laden with fruit, and there was no appearance of mildew whatever. The fruit was the largest of the foreign sorts—some specimens measuring over four inches in circumference—that is, horizontal circumference, and not from stem to apex. These beautiful, miniature trees were growing in a sandy soil somewhat shaded by apple trees ten feet to the south of them.

TOKUN FARM NOTES.

R. GOODMAN.

How to become a practical farmer is the aim of many young men of position and wealth, and yet they hesitate to set about acquiring the necessary knowledge in the only correct manner. If they have been graduated at some literary institution and are well up in their chemistry and other physical sciences, the best method is that pursued on the continent of Europe where educated young men belonging to families in good positions, remain for a time as pupils or managers on some large estate. In Germany any visitor to the large farms need not be surprised to see as superintendent the son of a banker, a baron or a rich landowner, who has been grounded in the theories of the profession at an agricultural college and is now training himself for the practical direction of an estate of his own. If he has not received any instruction in agriculture—generally, if he has—he commences at the bottom, drives the cart and grooms the horses, guides the plow and so arrives by degress at a knowledge of all the machinery and processes, and in no wise differs from the other workmen except that he takes his meals at the table of the owner of the estate and lives with him indoors as an equal. One can hardly appreciate at its true price the light continental literature—such novels for instance as "Renee and Franz" (Le Blenet) of Gustave Haller, or "Seed Time and Harvest" of F. Renter, without a knowledge of this state of things; and even in England a young man of the upper classes expecting to inherit an estate, does not consider his dignity compromised in performing the work of a farm laborer and doing the necessary "chores," as we should say, by which methods he can alone acquire that practical knowledge which will fit him to manage his own estate. Instances of the same way of learning the details of the farm are not common among the sons of persons of wealth and station in this country, democratic as our society pretends to be, but the examples of Mr. Burnet proprietor of Deerfort Farm whose profitable production of pork and butter, has placed him in the front rank of successful agriculturists, and of Mr. E. F. Bowditch, also possessor of a large estate, and noted as a Jersey breeder, both of Massachusetts, may be cited as prominent and instructive cases of young men ambitious to stand at the head of their profession and also to make their farming pay, apprenticing themselves temporarily with one of the best practical farmers of their vicinity and performing the same work as the ordinary hired laborers, and thus using lowliness as young ambition's ladder, but when the upmost round was once attained, not scorning the base degrees by which they did ascend.

If the young aspirant to agricultural "honors" is not a graduate of any literary institution, he cannot do better than take a course of theoretical and practical instruction in one of the agricultural colleges endowed by the United States Government and established by the States, and if it is conducted as it should be, he will acquire a knowledge of the sciences connected with farming and a theoretical and to some extent a practical knowledge of the pursuit itself, which he can put in operation, and improve, as the young Germans do, by taking charge of some land-owner's farm and doing personally the work for a season, or of his own if he prefers to be at once master and servant, as most Americans do. Agriculture, though young as a *science* is old as an *art*, and our young men of wealth who are attentive to "the frivolous work of polished idleness," to use a phrase of Sir James MacIntosh, but yet worthy of better employment, may with profit study the ways of even such ancients as the country gentlemen among the Greeks who revelled in their snug country boxes and pleasant acres and did not disdain to don proper attire and share in the necessary labors of the farm, many of them in fact, like Ulysses's father or our New England farmers, being arrayed in "weeds all torn and tattered fit for homely deeds." But they knew a "hawk from a handsaw," had an eye for thoroughbred horses and cattle, swine and fowl. XENOPHON, who was both a good general and farmer, wrote a treatise on horsemanship which is good authority at the present time, and his precept on the training of the noble animal "*never use him ill through anger*" is worthy of all time, and a good horse cost money then as now. Bucephalus, of Alexander fame, is said to have been purchased for $1200. A pair of mules cost $120. Those old farmers didn't hesitate at paying big prices for the best breeding animals; rams from Spain at $1,200; $1,000 for a milk-white boar, and during the Peloponnesian war sucking pigs were held as high as $52 each. Alcibiades's dog whose tail he cut, according to Plutarch, to make the Athenians talk about *that* and not of himself, cost him $1050, not quite equal to the price of the queen at the N. Y. bench show, ticketed $50,000! As the average price of a good acre of land in Attica was about thirty dollars, a country place was not very costly, nor were they of great extent, that of Alcibiades being only seventy acres, and any one possessing three hundred acres of frontier land, was esteemed an immense land-holder.

Then these hearty old fellows, like their English successors, lived mainly out-of-doors walking or riding on their farms and superintending the details of all the work and studying whether any improvements could be made, and carrying them out so far as could be done without any knowledge of the *science* of farming experiments. "For in all" says one of them, "that we can discover by our experiments upon soils *we are sure of the truth of what we see.*" Provided, we may add, these experiments are continued long enough, and all the concomitants attended to with the utmost accuracy. They also followed the sports of the chase, racing, cock and quail fighting, wrestling and boxing matches, and after the daily bath or at the end of the day, when the labor was over, *reclined* at a table richly spread. With the lamentable exception of not holding the fair sex in proper esteem and giving the ladies equal and just rights and privileges, the great country gentleman appears to have been well up to the comforts and enjoyments of life as we appreciate them, and our young men of leisure may profitably study him as a good example.

Berkshire Co., Mass.

Farm Economy.

HISTORY OF A POOR FARM.—No. 12.

How Should Manure be Used?

"I SAW you plowing in manure to-day," remarked Mr. Martin; "you don't practice what you preach. I have heard you tell our old friend here and his son, William, that manure should be always spread on the surface."

"So I believe it should," I replied; "but I am not the first by any means who does not live up to his professions. There are some occasions upon which even the best men go astray, and I may be excused a lapse now and then as well as they. I could not help it. A beginner on a poor farm must do many things which he would not if he could avoid it. The manure was fresh and long, with some straw in it: the cellar was full and required to be emptied, and the corn needed it—what could I do?"

"I think you did right," remarked my old neighbor; "manure ought to be well covered. I have always plowed it in and would now, but you have talked William over to your ideas, and he *will* put it on the top and harrow it in, or put it on the sod."

"Look over there," said I. Across the road was a meadow of the old gentleman's which had been pastured in the fall and the spring, and it was spotted over with hummocks of tall grass where cows' droppings had fallen. "What makes those bunches of tall grass?"

"Well; those are where the cows have dropped," he replied.

"And the grass is twice as thick and tall in those spots as elsewhere; it was top-dressed there, wasn't it?"

"Well, I guess so;" he replied.

"I think that is enough, so far as grass is concerned," said I. "Now let us consider about plowed ground. The purpose for which we manure our fields is to feed the crops, and I think we agreed once, that if the crops are fed when they are young and growing the most vigorously, they will thrive the better for it. If we don't feed them then, they start slowly and become stunted, and frequently never recover through the season. When the plants are young the roots are small and near the surface; if the manure is five or six inches down, or a foot away upon one side, it takes some time for the tiny and weak roots to find or reach it, and this operates the more disadvantageously because the roots are weak for want of food and may actually perish, and many do perish, by starvation, before they can reach the food. Suppose a hungry man were told that a supply of food was buried 100 feet or more in the earth, and as soon as he dug down to it, he could eat and drink and be filled. He would probably die of starvation before he could procure it. I think it is just so with plants; only the work they have to perform is more exhausting, and they are more likely to starve in their endeavor to perform it than in the case of the man."

"There is another view of the case," remarked Dr. Jones. "The soil is a great oxidizer. There is no more active disinfectant than earth, and the process of disinfecting is simply one of oxidizing or combustion. This was remarkably well shown by Dr. Voelcker in some experiments with the soil taken from some earth closets, in which it was found, that after the earth had been used several times, and might have been expected to have contained a large quantity of nitrogen from the accumulated manure, on the contrary, it was very little richer than at first, and the nitrogen had largely disappeared. It is a well known fact in chemistry that exceedingly porous bodies, such as charcoal, earth, and especially spongy platinum, possess a remarkable capacity for absorbing oxygen and other gases from the atmosphere, condensing them, and causing chemical changes in them. Now, while so far as regards the action of the soil, when it is in a minute state of divison, upon nitrogen, hydrogen and oxygen, we have not sufficiently accurate knowledge to form a clear opinion, yet we know that a large portion of the organic matter in the soil disappears, together with its resulting chemical constituents; they go and we cannot trace them. If this happens with animal and vegetable matter of one kind, it must be so with matter of another kind, as common manure."

"Then you think the manure wastes in the soil?" said Mr. Martin.

"I don't see how we can account for the disappearance of the nitrogen in the earth-closet soil, nor for other well-known circumstances, without such a conclusion," replied Dr. Jones.

"I have tried surface manuring and plowing it in," said Mr. Martin, "and have found it best to adhere to the former practice. I don't know so much about the theory, which seems very reasonable, but of the advantage of the practice I have no doubt."

"I think you are right," I remarked, "and I am inclined to believe that Dr. Jones's theory has some good basis. The majority of good farmers, who are apt to note cause and effect, keep their manure as near the surface as possible, and that they may do this, it is necessary that the manure should be fine and easily broken up. If long straw is used for litter, it is necessary to work over the manure to get it into good condition for harrowing into the soil; because it is impossible to spread long manure with the harrow, unless it is a disc harrow. Long, fresh manure must be plowed in, and there is a disadvantage and a loss in using it in this condition; but there is a loss also in keeping manure fermenting to prepare it for use, and the question comes up: how can we escape either of these losses?"

"Use fine litter," remarked Mr. Martin. "I think I would rather go to the trouble to cut my straw in the fodder cutter and bed my cows and horses with the chaff, than either to plow in long manure, or to keep it idle for six months or more."

"Dr. Voelcker has said that he is not satisfied that any of the nitrogen of the earth-closet soil is lost by oxidation," said Fred. "He has distinctly disclaimed any such view."

"That may be," replied Dr. Jones. "To disclaim a particular opinion is not to oppose it; and I feel confident that Dr. Voelcker would not go so far as to say that the view is not reasonable; only it is not proved; and a truly scientific man will never say a thing is so, or will very rarely suggest any opinion, without good grounds for it. This process of nitrification, or oxidation of nitrogenous matters in the soil, is no new thing. Years ago, saltpeter was manufactured for war purposes by making beds of vegetable and animal matter mixed with earth, and leaving them to undergo this natural process. It has been recently discovered that the nitrification or oxidation is caused by the growth of a vegetable organism or ferment in the soil; it has also been found that the same process goes on in the growth of mushrooms in the beds of manure and soil usually prepared for their culture. But it has also been found that as soon as this oxidation has been perfected, the nitric acid thus formed immediately begins to be de-oxydized, and its nitrogen escapes in a free condition into the atmosphere. It is, in fact, the final round of the circle, so frequent in nature. Nitrogen is brought in some way from the atmosphere, and enters into combination with the organic substances; these decompose, and nitric acid is formed in the process; this is decomposed in its turn, and the nitrogen is returned to the atmosphere; thus ending the circle of changes, and ready to begin anew. It is a beautiful theory, and while it would be premature to speak positively about it, yet it seems to be a true one. Let us take a short walk and look how this thing works in the field. I have a field of oats for green fodder, which

was partly surface-manured, and on a part of it the manure was plowed in. Here we can see the difference; the only difference in the manure was that the fine portion was made of swamp muck for bedding, and for the coarser part, rye straw was used for the litter. In one place the oats are already in head, dark green in color and twice as high as in the other part; the field was treated alike as to plowing and sowing and was all sowed the same day."

"There is a great difference," remarked the old gentleman, "but won't you get the good of the manure in the next crop?"

"That may be, but I doubt if the benefit will be equal to the present loss," said Mr. Martin.

"What we need," said I, "is to get immediate returns from our work. We cannot wait a year or six months for that, and the danger is, that if we do not get it at once, we may never see it at all. In the meantime the manure is idle and unproductive. Besides, if it is true that with the very best management we lose a considerable portion of the manure while it is piled in the yard and undergoing decomposition there, it seems that we cannot avoid losing just as much while it is decomposing in the ground, unless the crop is feeding upon it. It is very evident that just here the oats have not yet reached the manure; or, at any rate, are as yet getting no benefit from it. Here is a field of orchard-grass and clover, that was seeded in August last with turnips. The turnips were pulled in November and a portion of the grass was top-dressed with fine manure. Fred has been cutting fodder for the cows here since the 10th of May, and the first that was cut over, is ready for cutting again, in less than one month. The other portion of the field was dressed with 300 pounds per acre of artificial fertilizer, but, as you see, it is only half as good as this; still, if it were not that this is much better than usual, that would have been thought good.

"I consider this business of manuring the most important that we have to consider. There were in 1870 nearly 2,700,000 farms in the United States, averaging 150 acres each. With the rapid increase which has occurred since then, we may reasonably assume that there are now 3,000,000 farms numbering 450,000,000 of acres. Of this vast surface of land, at least one-fourth is under such a system of cultivation as requires it to be manured periodically. If an average of five loads per acre annually is used on this portion, there are nearly 600,000,000 loads of manure applied to the soil every year. A ton of fresh manure of average quality contains at least of

Nitrogen, 10 pounds, worth	$1 50
Phosphoric acid, 6 pounds, worth	36
Potash, 12 pounds, worth	48
Total value	$2 34

At two dollars per ton, we have an annual production of manure equal to $1,200,000,000. *One thousand two hundred million dollars!!!* At $1 per ton, we have $600,000,000, and if it is not well worth considering how we can use all this valuable product in the best manner, and so as to return us the greatest benefit from its use; then I don't know that it is worth while to discuss any question relating to our business. Any person who is acquainted with the average practice of farmers, will readily admit that much of the value of the manure made is lost in the management and using of it. If one-fourth is lost, it amounts to more than the total value of all our hog products and nearly as much as that of our whole wheat crop, taking only the least estimate I have here made. It is truly a subject that is well worth thinking and talking about and experimenting upon in the field.

Horticultural.

A VISIT TO DUNKLEY'S.

S. Q. LENT.

DUNKLEY is a market gardener, living in Kalamazoo, Michigan. Everybody knows him there. I might call him Mr. Dunkley, but I know he will consider it no offense if I call him just by the name that his fame gives him. We had heard that at Dunkley's a plan of irrigation had been adopted, which had been eminently successful in many ways, and inspired by a desire for increased knowledge in matters of horticulture, we took the train from Grand Rapids the other morning, to spend the day in search of new facts in the irrigation line, at Kalamazoo.

Perhaps it will be well to explain very briefly some conditions: Firstly, Kalamazoo is fifty miles from Grand Rapids—a two hours' ride, as trains move in Michigan. It is the largest village in the world, beautiful in its embellishments, and thrifty in its enterprise. It is the center of a good fruit region, and progressive horticulture, in its broadest sense, is a matter of reasonable pride on the part of the residents. Secondly, by "we" I mean a party of five gentlemen, whose names have all appeared in the RURAL columns, as connected with the Michigan State Pomological Society. This last compound statement I trust will be sufficient surety for the truthfulness of the concise statements which I am about to make as the journalistic representative of the party.

Dunkley's place is a mile from the center of the village, and through the courtesy of a son of the proprietor, we were piloted about the place. A force of several hands were picking strawberries from rows of very vigorous plants, and, as we opened the vines in advance of the pickers, a more delightful strawberry prospect, we all agreed, we had never seen. The varieties were: Monarch, Seneca Chief, and Wilson, and under the system of irrigation employed, they were just prime for market after all other berries from the vicinity had ripened and were gone, save a few insignificant boxes that could in no way affect the market.

It took us a very short time to learn the following facts:

1st. Under the system practiced by Dunkley, his berries were two weeks later than the general crop of the vicinity, and they were thrown upon the market when prices were remunerative.

2d. His vines were vigorous and independent of rains, so that every berry that set could reach perfection in size and flavor.

3d. The necessity of picking every day or every other day for the sake of saving a few berries that would otherwise become over-ripe, was entirely obviated, and a picking once in four or five days would be very large and a rapid gathering at the least possible outlay, was accomplished.

4th. The fruit, becoming more mature without losing its firmness, was more luscious, and yet scarcely anything was lost in the character which every berry picked for market must have to hold its shape until sold.

5th. The vigorous vines gave protection to the berries from the direct rays of our very hot meridian sun, which preserved even those which were over-ripe from so soon losing flavor.

We were invited to inspect the simple method of irrigation, and while walking to the fountain-head we had ample opportunity to view the vegetable garden, which we found in a most flourishing condition. The cabbages and tomatoes particularly attracted our attention, because of their forwardness.

"How's this?" we inquired; "your method of irrigation puts back your strawberries but puts ahead your vegetables."

"Cabbages," he replied, "are advanced, to be sure, because it is leaves we are after, and our method tends to a very rapid growth of foliage. But with tomatoes I need to make this further explanation: the fruit develops in size very rapidly, but should we continue to regularly apply our water, the ripening process would be retarded the same as with strawberries; but as soon as the fruit is of fair size, we withhold the water, and they ripen rapidly. We have found that there is a good deal of study connected with properly and economically employing irrigation in the garden." So we thought, after witnessing this anomalous state of things.

"We water," said he, "only to supplement the rain. If the season is a wet one, we employ our artificial system little or not at all, and in such seasons get no profit from our investments; but generally some time during the season we get a drought that shortens some crop, then we irrigate that crop, and have the advantage of our neighboring gardeners."

The fountain of supply from which the water was taken, we found to be a spring, dammed up at a point which was a little higher than most of the garden. The water was conveyed in a wooden conduit made of two-inch plank, rendered water-tight by the use of coal-tar. It was, perhaps, eight inches wide and a foot deep. At intervals of about eight feet, auger holes were bored near the top of the conductor. The rows of vegetables and vines run at right-angles to the line of the conduit, and are so arranged that each alternate space between the rows comes opposite a hole in the conductor. When the water is wanted in any particular locality, a cut-off is made just beyond the opening at this point, and the water being let on at the fountain-head pours out a nice stream and follows down the row. The surface of the ground has been carefully graded, so that the progress of a stream of water let on is very slow, giving plenty of chance for the water to settle about the roots of the plants. Having once secured a place with the natural arrangement of a spring at some point higher than the general surface, this process of irrigation is an inexpensive one.

The question has been often asked me whether a windmill could not be successfully employed in irrigating fields of strawberries, and, having had no experience, I have ventured the opinion that a windmill might be profitably employed for this purpose. But when I saw the amount of water actually used here to irrigate a small garden, I saw that an ordinary windmill would be a small affair to accomplish such results. Upon inquiry, I found that Mr. Dunkley had first tried a windmill and found it entirely inadequate to accomplish his purpose.

A word regarding the management of the strawberry fields at this place. After the berries are removed, the ground between the rows is thoroughly cultivated through the remainder of the season; the vines run together in matted rows, and in this condition go into winter. Early in spring, a good coating of long stable manure is given. That which has begun to decompose a little, or that in the making of which short wheat straw has been used, is preferred. This manure is spread evenly over the surface and the vines make their way through it easily. By the time the berries are ready to be picked, it is all down close to the ground between the rows. The covering is placed on in the spring to retard the blossoming as well as to preserve from evaporation the water that is employed in irrigating the rows.

The Wilson Strawberry is talked about as a sour fruit fit for market, but not fit to eat. Dunkley's Wilsons were not only fit for market, but delicious to the taste—*but they were ripe.* A ripe Wilson is rarely found in any market, and the hue and cry about it as a poor, sour berry, is founded upon a misapprehension of facts. A luscious strawberry must have the acid in it, to begin with, but it must be tempered by a thorough ripening process. Many varieties far inferior to the Wilson, rank higher among consumers, because in the imperfectly ripened state in which they are put upon the market, they are less acid. Dunkley's Wilsons were as good as any Cumberland Triumphs or Black Defiances I ever tasted, because they were ripened slowly upon good soil and perfected in flavor before being taken from the vines.

After testing the quality of all the varieties raised at Dunkley's, we drove rapidly through the streets of the big village, and were delighted with the many beautiful homes with tasty surroundings, that we saw everywhere, and could see no reason why happiness could not exist in nearly every family, if Dunkley could only raise strawberries enough to supply them all.

Grand Rapids, Mich.

STRAWBERRY NOTES FROM MICHIGAN.

PRES. T. T. LYON.

THE present season has, in this locality, been more than usually favorable to the Strawberry, (both plant and fruit,) and as the season of this fruit is now near its close, with us, it occurs to me that some notes respecting the ripening of some of the sorts, with statements as to their comparative success, may be of interest to the public. It should be understood that our location is directly upon the eastern shore of Lake Michigan, and that, for this reason, the Strawberry, in common with other fruits, is about ten days later in ripening, with us, than at points farther inland.

The dates given are those of gathering the first fully ripe, perfectly and naturally grown specimens, the soil being, in nearly all cases, a rich, warm, sandy loam.

The season opened, on June 5th, with ripe berries of Duncan and Mexican Everbearing; followed on the 6th by Nicanor and America. On the 9th we found ripe berries of Photo, Cinderella and Green Prolific; followed on the 10th by Russell's Advance, Monarch of the West, Champion, Black Defiance, Capt. Jack, Charles Downing, Col. Cheney, Duchesse, Downer's Prolific, and Victoria, (Golden Queen). Ripe fruit of Iowa Prolific, Seneca Queen, Dr. Warder, Great American, Matilda and Wilson's Albany, occurred on the 11th. On the 12th came Bidwell, Jucunda, Triomphe de Gand, Cumberland Triumph, Cowing's Seedling, Grace, French, Excelsior and Crescent. On the 13th, Lady Finger, Hudson's No. 10, Hudson's Early Starr, President Lincoln, Boyden's No. 30, (Seth Boyden) Kissany, and Ida; and on the 14th, Glendale, General Sherman, Emperor, Afrique, Wilding Seedling, Agriculturist, Damask Beauty, Major McMahon, Scarlet Globe, Luckhurst, Late Prolific, Golden Defiance, Hooker, Shirts, and Sharpless. On the 16th ripened Kentucky, President Wilder, and Michigan; and on the 17th, Star of the West, Sterling, Springdale and Seneca Chief. The 18th gave us Romeyn, Burr Oak, Caroline, and Centennial Favorite; and the 20th may be said to have completed the season, with Frontenac, Marvin, Walden and Forest Rose.

Of these a few, among which are Iowa Prolific, President Lincoln, Shirts, Sharpless, Centennial Favorite and Forest Rose, may have been delayed in ripening on account of the comparative feebleness, in spring, of plants transplanted in a severe drought in August and September of last year.

Nicanor, although of fine quality, is quite too small except possibly for the fastidious amateur.

America is pistillate, and although we have always grown it alternated with others, it has utterly failed two years out of four. This season it is wonderfully productive; equalling the Wilson at its best—quality excellent.

Russell's Advance is of excellent quality, and of good size; a little variable in this particular, and may not acquire a high position among so many competitors.

Champion is greatly praised and is really large throughout the season, but too acid and hardly rich or firm enough for market. We distrust it also for the reason that it is pistillate.

Black Defiance and Capt. Jack are both of fine quality and good size—the former much the larger; and we regard them as promising market sorts.

Col. Cheney is too weak in plant and too soft.

Seneca Queen has this season proved exceedingly productive; which, with fine color, large, even size, and fair quality, seems likely to render it a valuable market berry. Should it continue to do as well, it must take a high position.

Great American, which failed utterly last year, has produced a fair crop of large berries this season; which are pleasant though not of high quality.

Matilda we are more and more disposed to esteem highly as a valuable market berry.

Bidwell, which did poorly last season, has more than redeemed itself. We are inclined to consider it as even more valuable than Monarch of the West; but more extended trial seems needful to properly establish its character.

Triumph of Cumberland has few, if any, superiors in its season among the very large varieties, as it holds its size well throughout the season. It is slightly wanting in color and also in firmness.

Cowing's Seedling we still consider among the most desirable for light soils, and for local or house use.

Crescent is certainly a rampant grower and a great bearer; but is certainly too soft for distant marketing.

Starr is unusually fine in quality, but of its general characteristics we cannot yet speak confidently.

Glendale gives evidence of many valuable qualities, but must have another year's trial.

General Sherman seems also to be very promising, but must wait.

Major McMahon is very fine on our light soil, and we are at a loss to imagine why it has attracted so little attention.

Golden Defiance, although rather light-colored, seems to possess good qualities as a late berry.

Hooker is of medium size, and of exceptionally fine quality; but its very unattractive color is greatly against its popularity.

Shirts is a large, very long, conical berry, of exceptionally fine flavor for so large a fruit. It was first brought to notice last year by Ezekiel J. Shirts of Oceana Co., Michigan. It may be slightly lacking in firmness, otherwise we regard it as very promising.

Sharpless has produced fruit here, on plants set out last August. The fruit is very large, long, conical, regular, as grown here; and, in flavor, among the best of the very large fruits. It seems to be slightly lacking in firmness for a market berry; still its size, quality and color are sufficient to insure its popularity.

Star of the West is too soft, as well as unproductive.

Sterling, although more productive than the above, and of very fair quality, is yet too soft, and too light a cropper to meet the views of market growers.

Springdale is fairly productive, and has size and lateness in its favor as a market variety.

Seneca Chief will do as a late berry, if kept within proper limits, and not allowed to run too much to wood.

Burr Oak certainly has quality and fair size in its favor. Why it is shoved aside, as it seems to have been, we have not yet learned.

Caroline gives indications of value or desirableness as a late variety. It needs further trial.

Frontenac is among the very latest; its quality is superior, and it is, moreover, a rampant grower. Its pistillate character, we fear, will prove fatal to its usefulness.

Marvin was brought to our notice last year when the fruiting season was some time past. Plants sent us in pots last August, are now producing a fine crop, fully one-half of which is now (July 1st) still immature. The fruit is of glossy appearance, like Triomphe de Gand, rich and bright in color, and of the largest size. The specimens shown at the recent session of our State Pomological Society (June 17, 18 and 19) were said to be the first picking; and were very large and most of them were slightly cockscombed. Those grown on our sandy loam, with medium culture, are mostly free from this defect—if defect it should be called. The berry is firm, and we judge will bear transportation well.

Forest Rose has not yet fruited sufficiently to establish its character, which another season may be expected to develop.

Windsor is a new, very large, bright-colored berry, which was shown at the recent meeting of our State Pomological Society, and is said to have originated in Ingham or Eaton county, Michigan. The fruit, though very large and bright-colored, came in bad condition; and

was called by the contributor (who was not present), "Windsor Chief"—(doubtless the same described lately in the RURAL under that name). The Society, having been authorized to impose a name, did so by dropping the "Chief," leaving it simply Windsor. Of the peculiarities of the plant and its bloom, we know nothing. The variety (as were also the Marion and Shirts) was recommended as worthy of trial.

South Haven, Mich.

FIELD CULTURE OF STRAWBERRIES.

THE present outlook of the strawberry business is such as to make it expedient for growers to adopt some method of culture by which good fruit can be produced cheaply. The time is past when poor, inferior strawberries will sell in the market for a price that will well repay the producer.

The chief requisites for success in growing strawberries for market, are a well-prepared soil, a proper selection of varieties, and good care and cultivation. If the soil is naturally heavy, it should be the more thoroughly prepared, so that it will be loose and mellow. If the ground in which the plants are set, is foul from grass and weeds, it should be summer-fallowed the season previous to the planting.

There are several modes of cultivating the Strawberry, all of which have some advantages, but on a clean soil, and with prolific varieties, the method known as the "matted-row" system will, perhaps, produce the best results. The plants are set in spring or fall in rows, three and a half feet apart, with plants a foot apart in the rows. The soil should be kept mellow and free from weeds by frequent hoeing and cultivating.

When the runners begin to take root the cultivator teeth are narrowed up so as to leave a space a foot or eighteen inches wide, for the plants to occupy. Considerable hand weeding will be necessary to keep the matted rows free from grass and weeds; but if the soil is comparatively clean, the expense of weeding will not be more than is required to keep the runners picked off, which is necessary when the plants are kept in hills.

There are some varieties of Strawberries that will bear equally good fruit if allowed to run, and the yield per acre will be much greater than if kept in hills. It is important in selecting varieties to choose those best adapted to the soil in which they are to be planted. If poor varieties are set, good crops cannot be obtained, even with the best culture. It costs little more to grow large, firm strawberries, that will bear sending a long distance to market, than those which are small in size and too soft to be handled, while the difference in the price received for them will be decidedly in favor of the former. G. GOFF, JR.

Elmira, N. Y.

TARDY GERMINATION OF SEEDS.—I wish to say to M. F. J., of Uniontown, Pa., not to be discouraged. My seeds from the RURAL, which included Callicarpa and Yucca, were sowed in a seed-bed, with bottom heat, near the last of April, beside my annuals, which I always raise in this way, thinking it more certain than to sow them in the open garden. The annuals have been transplanted several weeks, and some of them are coming into bloom, but the Callicarpa seed is just up, and cannot yet boast of the second leaf. The Yuccas are about two inches in hight. I have learned that the seeds of shrubs and perennials are usually much longer in germinating than those of annuals. Besides those mentioned, I had also Deutzia, Weigela, and the Hybrid Aquilegia. I think none of them made its appearance above ground till four to six weeks from sowing, and not until the annuals beside them were large plants; but they are all up now and doing finely, though the Callicarpa is much the smallest of them all. Several times I was about to write and ask, "What ails the seeds?" but concluded to wait a little longer, and now I have the reward for my faith and patience. MRS. W. C. G.

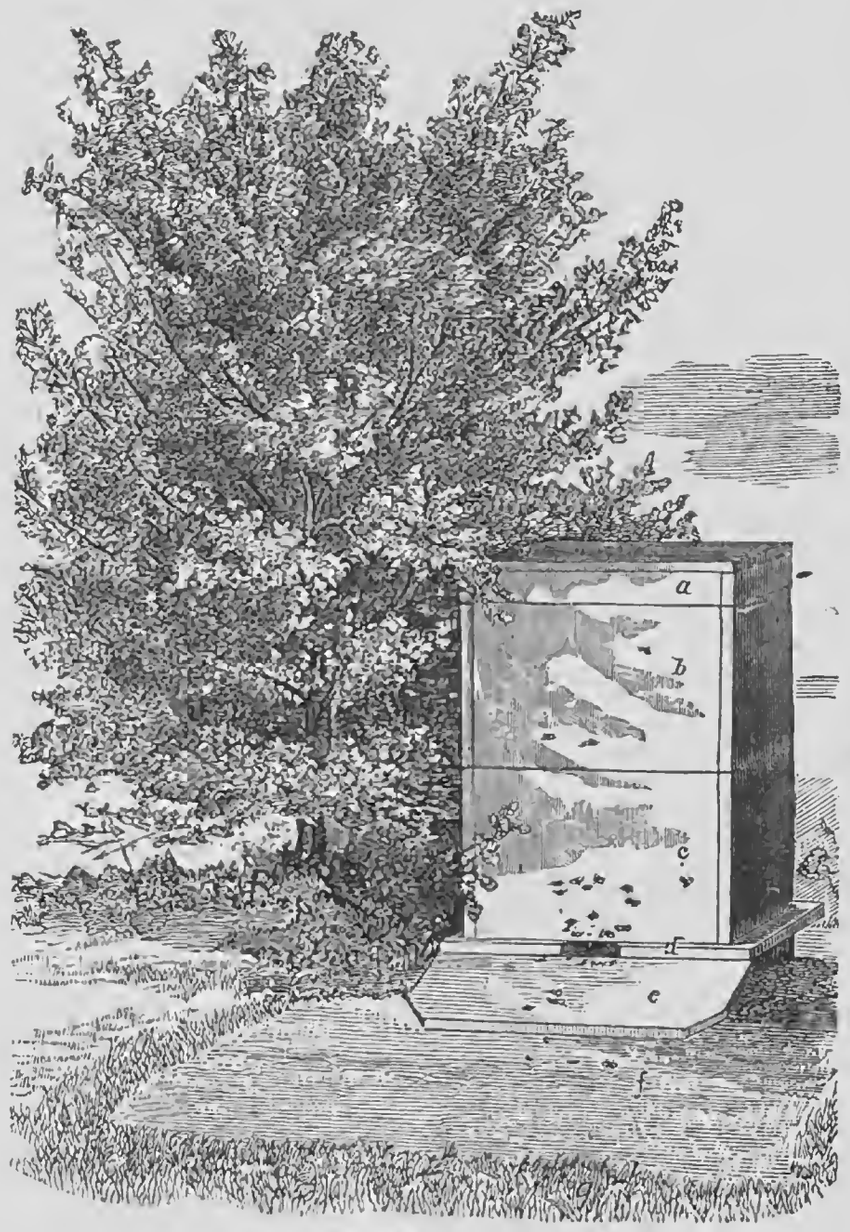
Jamestown, N. Y., July 7.

The Apiarian.

POSITION OF HIVES IN THE APIARY.

IT is of importance that the hives should be sheltered to some degree, both from the strong winds and from the full blaze of the sun. Such protection may be given by erecting board fences along which the hives are arranged, a method employed in some instances; but, besides being expensive, a board fence is neither so efficient nor so decorative to the premises as are trees or shrubs. The apiary may be located in an orchard, which is a good plan if the orchard is near the house. The spreading trees will give the desired shade, while high winds are not apt to be severely felt.

If the bee-keeper has a vineyard of large, spreading vines, tied to trellises running east and west, the hives may be arranged in rows on the north side of the trellises. Shade must be had. If the hives are exposed to the sun at this season of the year, the temperature within will become unbearable to the bees, and they will then cluster idly on the outside instead of attending actively to their work; the uncapped honey will become so liquid that it will run out of the cells, and often out of the hives, affording cause for contention and robbery by other bees, while sometimes the wax may be so weakened in its consistency that heavy combs fall down, causing, of course, both bees and bee-keeper extra trouble. The Tartarian Honeysuckle, Lilacs, Philadelphus, or any kind of shrub of compact growth and a dense mass of foliage, may be planted in the apiary at intervals of eight or ten feet, and the hives placed on the north side of these. Evergreens may also be used for this purpose, and they have the advantage over deciduous shrubs that they shed no leaves to be raked up or blown about by the wind to make the place untidy.



POSITION OF HIVES IN THE APIARY.

The accompanying cut, which appears also in Cook's "Manual of the Apiary" and has kindly been furnished us by Prof. Cook, shows the position a hive should have in the apiary. The evergreen on the south side, shelters it alike from the sun during the hottest part of the day and from the strong winds that may come from southerly points between the east and the west. The Norway Spruce is admirable for this purpose. It will bear cutting back almost to any extent, stands the severest winters, and is not particular as to the kind of soil. They should be planted in rows of eight by ten feet apart, and so arranged that one stands opposite the opening between two Planting them thus in rows may not be sanctioned by landscape gardeners, for it gives the place a certain stiffness which would be avoided if they were scattered about in groups without any regularity, but it is a decided advantage to the apiarist to have the stands in rows, and, of course, all numbered, especially in large apiaries. Colonies will not then be so likely to be overlooked and forgotten as is the case when they are scattered irregularly.

The hive should be raised only four or five inches from the ground, as seen in the engraving. When raised on stands two or more feet high, many bees are lost in the early spring. Coming home heavily laden, tired, and, chilled, they often miss the alighting board, and falling under the stand they are unable to rise again. To have the hive on a raised stand also causes inconvenience in the transferring of bees. The grass immediately around the hive should not only be kept down, but under and in front of the hive a place, five by five feet square, should be dug out six inches deep, and filled with gravel, sand or sawdust. This is easily done, and is by far the cheapest in the end. Once well done, there will be no grass to mow every week during the summer. The queen is not so liable to be lost, neither in transferring nor, when in the case of swarming, she crawls out and her wing being clipped, is unable to follow her army. One is also better able to observe what the bees expel from the hive. Those who are about to begin bee-keeping, will do well to consider these points.

FRANKINCENSE.

Miscellaneous.

FRANKINCENSE.

THE common frankincense of commerce, also known as gum Thus, is a resin which exudes from fissures in the bark of the Norway Spruce—Abies excelsa. When melted in hot water and strained, it constitutes Burgundy pitch. The turpentine obtained by making incisions in the trunk of a species of our Southern Pines—Pinus australis—when old and hard, is also often called by that name; though commercially known as "scrape."

The true frankincense of the ancients, however, is the fragrant gum resin known in medicine as olibanum, the product of certain species of trees of the genus Boswellia, which grow among the mountains of Central India, upon the Coromandel Coast, and also in the interior of Arabia. The members of the genus have the following characteristics:—Bark often papyrus-like; leaves deciduous, compound, alternate, imparipinnate, with leaflets serrate or entire; flowers in racemes or panicles, white, green, yellowish or pink. The trees are described as growing on the coast of Adel, without soil, out of polished marble rocks to which they are attached by a thick oval mass of a substance resembling a mixture of lime and mortar. The purer the marble the finer appears to be the growth of the tree. The young trees furnish the most valuable gum, the older yielding merely a clear glutinous fluid resembling copal varnish. To obtain the frankincense a deep incision is made in the trunk of the tree and below it a narrow strip of bark is peeled off. When the exuded milk-juice has hardened by exposure to the atmosphere, the incision is deepened. In about three months the resin has attained the desired degree of consistency. The season for gathering lasts from May until the first rains in September. The clear globules are scraped off into baskets, and the inferior quality that has run down, is gathered separately.

Bombay and Calcutta are the chief markets for frankincense. It is in the form of roundish lumps or tears, semi-opaque, of a pale yellow color and covered with a whitish powder, produced by friction. It has an agreeable balsamic odor, but its taste is acid and bitter; it softens when chewed, adheres to the teeth and whitens the saliva. It burns with a bright white flame, diffusing a fragrant odor. It was this property which made it so highly esteemed by the ancients, who used it largely to conceal the smell arising from animals at their religious sacrifices. It was also thought that the smoke of its burning was an acceptable offering to the deity, as typical of prayer and interior worship. At present the Roman Catholic Church largely uses it at religious services, and it is also, to some extent, employed medicinally, as an ingredient in plasters and for fumigations.

BOOKS, PAMPHLETS AND CATALOGUES.

ILLINOIS CROP REPORTS, consolidated from returns to the Department of Agriculture. June 1; issued June 12. S. D. Fisher, Secretary. The dry weather early in the season enabled farmers to plant to corn a large area of low flat lands that for years have been too wet to plow early enough in the spring. Moreover, many unpromising fields of wheat and oats were plowed up and planted with corn, so that although 8,672,055 acres were under corn in 1878, there has been an increase of 293,706 acres this year, making a total of 8,965,761 acres. As shown by our special reports, the stand was very uneven, much replanting was needed, and the growth was slow. There has been much complaint of defective seed. The best corn is on fall-plowed land, and it is expected that the advantages of fall-plowing for corn are so manifest that the practice will become general, where the favorable results are known. Drilling is strongly recommended by many of the more successful corn-growers. Late rains and unusually good attention, it is expected, will produce a fair crop. The stand of winter wheat was generally good; the straw was short, but the heads well filled; the acreage was above the average, and a good many patches of winter wheat were sown in the "corn belt," thus indicating an advisable tendency to "mixed farming." The acreage under spring wheat is about the same as last year; any decrease is mainly due to plowing up fields injured by drought and planting them to corn. The early-sown wheat will alone be fair; and the aggregate yield

will be considerably below an average. The condition of oats is much below an average, varying from 5 to 50 per cent.; the area, too, is 118,964 acres less than last year's. Meadows were much below an average. Clover meadows were in much better condition than timothy. Meadows pastured in the spring were, as a rule, not worth cutting, and it is feared that the rains came too late to make much difference in the hay crop. In pastures only one county reported an average condition; all the others reported a decrease of from 10 to 75 per cent.; while the aggregate diminution of acreage amounts to 185,324 acres. The number of cattle was about the same as last season, and their condition was good, in view of the short pastures. The number of hogs in the State is less by nearly three-quarters of a million than last year. The small profits last year of even the best breeders, and the large losses often incurred by others, have had a depressing effect on this industry. Hogs are generally healthy and in condition above the average. For the last five years there has been a steady decrease in the number of sheep, chiefly of the fine-wool sort; but the increase in mutton sheep has not kept pace with the decline in the other kind; though it is hoped that the high prices lately realized for mutton will beget greater attention to this branch of stock-raising. Barley is considerably below an average. The acreage under flax is much above that of last year, but the condition of the crop was considerably below the average at date of report. The acreage under potatoes is about the same as last year; but the prospects of a fine yield were hardly as favorable as in most of the other States. Apples and pears were much below an average, and peaches almost an entire failure, while small fruits promised well.

QUARTERLY report of the Pennsylvania Board of Agriculture for March, April and May. T. J. Edge, Sec., Chester. The official country reports on which this State Report is based were closed out on June 1st. and several causes may since have changed the result in some localities. At that date, however, it was estimated that there would be a considerable falling-off in the wheat crop from that of last year, but still a good average crop was anticipated. The rye corp is estimated at 3,550,000 bushels with possibilities in favor of a larger amount. Since the rise of a demand for rye straw for the manufacture of paper there has been an increase in the area planted to this crop but there are no satisfactory data for estimating the extent of the increased acreage; the yield per acre is put down as probably less than usual. Of corn the average annual yield for ten years has been 35,250,000, bush. and owing to the backwardness of the season and the appearance of wire and web-worms the aggregate crop is not expected to be larger this year, though there seems to have been a slight increase of acreage. The average annual yield of oats for the past decade has been 31,250,000 bushels and although there is much talk of substituting some other crop for this, still the returns show a somewhat larger area than usual planted to it; it was too early to estimate the yield. Of hay the actual yield in tons was not expected to be as great as last year, but the nutritive quality of the crop promised to be better. Horses and mules were in fine condition generally, and healthy with the exception of a few cases of nasal and throat diseases. Within the last five years there has been a slight decrease in the number of cows and a depreciation in their condition. A few cases of pleuro-pneumonia and simple pneumonia were reported, but a great many cases of abortion, especially in the Eastern part of the State. So much uncertainty exists as to the cause and cure of this malady that a State committee has been appointed to investigate its cause or causes, and if possible to suggest remedies." Within the last five years there has been a slight falling-off in the condition of sheep throughout the State, although in seventeen counties there had been a marked improvement. The condition of swine is much the same as at this season last year. There may, on the whole, be a slight decrease in number, but there is also in some parts a considerable improvement in the value of the stock, due to the introduction of boars of improved breed. Fat cattle were not in many places in as good condition as at the same time last year, a mishap occasionally attributed to the belief that last year's hay did not "feed well." There has been a decrease of five cents per day in the cost of boarding a farm hand, and a corresponding decrease in his hire during the past year.

ENSILAGE.—This pamphlet of seven pages is in the form of a supplement to the larger work on the method of preserving fodder in silos, published by J. B. Brown, 55 Beekman Street, this city, and which is for sale by him for $1, as noticed in the RURAL several months ago. Both the larger work and this pamphlet are translations of the original works of Mons. A. Goffart, the French inventor of this method of preserving fodder, chiefly maize or Indian corn. The system is attracting a great deal of favorable attention in Europe, and has also been employed to a considerable extent in some parts of this country, and deserves the careful investigation of every progressive stock-owner.

Pamphlet of Pot-grown and other Strawberry Plants, by J. T. Lovett, proprietor of Monmouth Nursery, Little Silver, N. J. This successful small-fruit cultivator enumerates in his catalogue all the leading varieties of Strawberries, both for light and heavy soils. It contains, also, a short but practical treatise on the culture of Strawberries, which will prove valuable to amateurs. Mr. Lovett gives special attention to pot-grown plants, that is, young plants rooted in small pots sunk in the ground; such plants are stronger and will suffer but little or no check by being transplanted. The catalogue will be sent free on application.

DAIRY FARMING; edited by J. P. Sheldon, late resident Professor of Agriculture in the Royal Agricultural College, Cirencester. This new and original work by our correspondent, Prof. Sheldon, will be published in monthly parts by Messrs. Cassell, Petter & Galpin. It will be embellished with colored plates and original wood engravings, illustrating the various processes employed.

WHOLESALE PRICE-LIST of fruit trees, small fruits, ornamental plants and bulbs for sale by B. F. Transou & Co., Humboldt, Tenn. This is the 28th year since the establishment of Mr. Transou's nursery, and the record made by the firm during the interval is justly a matter of pride with them.

ANNUAL CATALOGUE and announcement of the Columbia Veterinary College and School of Comparative Medicine. New York.

WHAT OTHERS SAY.

"PEARL" MILLET.—We little thought when we wrote our playful remarks about the Pearl Millet that it would occasion enough trouble to our contemporary, the RURAL NEW-YORKER—the peer of any weekly agricultural journal in the world—to make a response. We never said, or meant to be understood as saying, the RURAL NEW-YORKER, or Mr. P. Henderson, claimed this to be a newly discovered plant. We published Mr. Henderson's glowing description of this Millet because we have faith in all Mr. Henderson writes, recognizing him as one of the best practical writers of the day, and knowing his works on gardening, etc., have been of inestimable worth to the people of the South especially. We saw with pleasure the beautiful illustrations of different Millets in the RURAL NEW-YORKER, and when we read the article of the Planter and Grange, we, in justice to our readers, gave them the benefit of its views, expunging the more offensive parts, that our patrons should not be left in error and blame us for indirectly endorsing all that was said in favor of *Pearl* Millet. We were, in fact, amused to see how a change of name from "Horse" or "Cat-tail" into the more attractive appellation of "Pearl" could raise suddenly the price and demand for the same article. However, we are sure that no money has been really lost by any who have bought the Pearl Millet if they followed the directions in regard to its culture, and *fed it in its green state* to the cattle. It is a crop for soiling and for green manuring, the *best* we have ever known. We confess, however, that we never fully appreciated Southern "Horse or Cat-tail" Millet as fully before we read the remarkable statement of our friend Henderson. [The above we take from our esteemed contemporary, the Maryland Farmer. We have ourselves remarked that the stalks when the plants grow old are as "hard as fish poles."—EDS.]

THE NEGLECTED MULBERRY.—Mr. Beecher says in the Christian Union, that Mulberries are a very much neglected fruit; there is no better fruit tree for children than the Downing's Ever-bearing Mulberry. One of them will bear fruit for eight or ten weeks steadily, constantly ripening, and pleasing all the fowls and turkeys, and children and old folks. He would rather have this mulberry to-day than a strawberry. The common mulberry is flat and sweet: but this has a fine sprightly acid taste, as finely combined as lemonade.

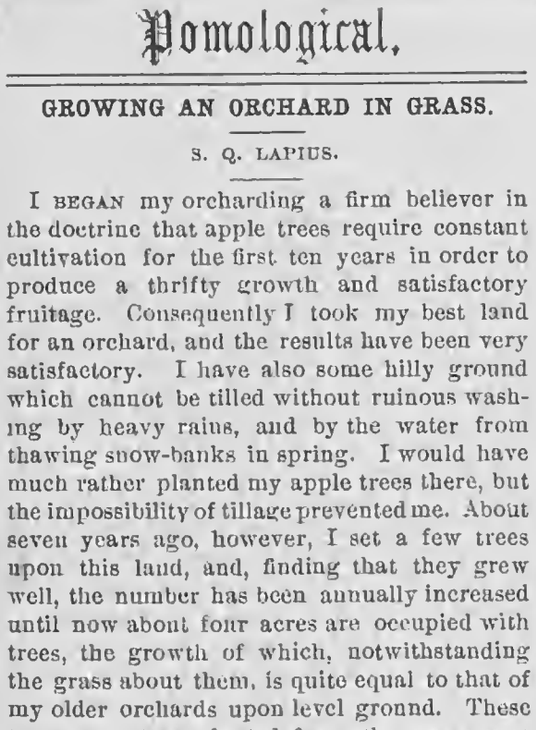
See page 464 for continuation of What Others Say?

Pomological.

GROWING AN ORCHARD IN GRASS.

S. Q. LAPIUS.

I BEGAN my orcharding a firm believer in the doctrine that apple trees require constant cultivation for the first ten years in order to produce a thrifty growth and satisfactory fruitage. Consequently I took my best land for an orchard, and the results have been very satisfactory. I have also some hilly ground which cannot be tilled without ruinous washing by heavy rains, and by the water from thawing snow-banks in spring. I would have much rather planted my apple trees there, but the impossibility of tillage prevented me. About seven years ago, however, I set a few trees upon this land, and, finding that they grew well, the number has been annually increased until now about four acres are occupied with trees, the growth of which, notwithstanding the grass about them, is quite equal to that of my older orchards upon level ground. These trees were transplanted from the nursery at the ages of two and three years from root graft, most of them at two. The holes were dug large enough to give a free spread to the roots, and afterwards the ground was dug away on the upper side in a semi-circle of three feet radius from the tree, the earth being placed upon the lower side, thus forming around the tree a flat surface, six feet in diameter, which is kept mulched with grass cut



from the surrounding area. The accompanying cut shows the appearance of trees two years after setting (four-year-old), and also illustrates my method of protection from mice and rabbits by tying common strip laths about the trunks. If left on during the whole year it is also an entire protection against the borer, and obviates injury from the action of the sun upon the bark. [The laths, as we understand it should be tied close to the tree. The artist shows them as forming an inclosure a foot or more square.—EDS.]

I am extremely well satisfied with my experiment so far. The annual elongation of the branches on these young trees, is from 18 to 30 inches. Quite a number are already in bearing. They are set out in rows twenty-five feet apart, the trees being 15 feet asunder in the row. The intention is to remove every alternate tree in the row as soon as they crowd one another, which will not be until they have given a number of good crops. About one-third of the grass cut around them is used for mulch, and in addition it is my practice to put about a bushel of leached hard-wood ashes around each tree upon the top of the old mulch when they have been two years set out. The land is naturally good, having been cleared of a heavy growth of Sugar Maple about thirty years ago. It is a somewhat gravelly loam. The slopes are in every direction except northerly, and the trees thrive equally well on all. A part of it is a hill-side below my garden, and this gets considerable wash, the result being an extraordinary growth of the Wealthy Apple trees there, and at four years from planting these promise quite a crop of fruit.

As my greatest fear in regard to these trees was from the effect of drought, especially on the southern slopes, my main object in making these flat circles about them, was to arrest the water flowing down the hill during heavy rains and give time for its absorption by the soil. This is satisfactorily effected, and with the mulch keeps the surface of the earth around the trees always moist. My chief trouble is to keep the fowls from scratching away this mulch to get at the insects which harbor beneath it. When there are enough small stones for the purpose I put them upon the top of the mulch. The land is kept in good condition by top-dressing, and as long as I can cut a heavy crop of hay, I shall expect to see the trees also grow as well. I hope in future years to be able to tell the RURAL readers how this orchard continues to prosper.

Orleans Co., Vt.

Industrial Implements.

PAYNE'S NEW ENGINE.

RECENT improvements, the outcome of practical tests, have been gathered together and put into the shape of a new agricultural engine which we illustrate this week. The makers, B. W. Payne & Son, of Corning, N. Y., claim that a ten-horse steamer of this construction will supply power sufficient to drive the largest class of separator, without over pressure, or excessive firing. This advantage is gained by the manner of constructing the boiler, and through the influence of an automatic cut-off, which, permits the steam to be used expansively—an economical principle that results in securing the maximum of work at the minimum of power. The principal and mechanical device by which it is secured are interesting to users of steam power, and being fully illustrated and explained by the manufacturers, we will simply refer our readers to them for particulars. They will be happy to supply them, we are sure.

The substantial results derived from the use of the cut-off, and the thorough way in which the engine is constructed, are productive of safety, economy of fuel, light weight, compactness, simplicity, strength, long wear and great saving of power.

The form of boiler used has been built and tested for more than twenty years. It is so little open to the objection of danger from explosion, that it is no longer a factor taken into account. At competitive trials the Payne engine has achieved a fine fame. Sparks are caught and subdued in spark-arresting chambers that are said to be a complete assurance against danger from fire. An examination of the engine has shown it to be excellently constructed, and the claimed advantages make it well worth investigation by those contemplating the use of steam-power for farming or thrashing purposes.

PAYNE'S NEW ENGINE.

THE Eureka Mower is making a fine record in Pennsylvania, as we learn from one of our subscribers, Mr. Wm. H. Sohn of New Scottsville, Beaver county. Being advised of the merits of the "Eureka" through the RURAL NEW-YORKER, one was purchased through a Pittsburgh dealer, and Mr. S. says "of all the mowers I ever saw work (and I have seen nearly all), it has the greatest advantages. We cut ten acres of very heavy clover without the least trouble, where last year in same piece, we had the greatest difficulty."

This is enthusiastic, certainly, and a little allowance must be made for exaggerations due to the effect of the weather, but the "Eureka" is growing in favor with giant strides, and Mr. S.'s letter is merely the exuberant expression of a perfectly satisfied farmer.

WATERTOWN, N. Y., June 27, 1879.

RURAL PUBLISHING CO.—*Gents.:* We are glad to add our names to your list of testimonials, as we consider the RURAL the best advertising medium for our business in the country. We have received more direct benefit from "*Ads*" in it than from any other in which we have ever published. Yours respectfully,

BRADLEY'S CHANGEABLE-SPEED MOWER took first prize silver medal at the Thorn Hill, (N. Y.) trial June 25th. First blood for Bradley & Co!

Everywhere.

NOTES FROM SOUTH FLORIDA.

ANY information from this State is interesting to a large number of readers North, as many are coming here, and many more are thinking about it; but the exaggerated and to a degree, untruthful reports from here, have to a large extent, disgusted the would-be settler and injured the State itself.

Manatee is in about lat. 26°. The soil hereabouts is a light, sandy one, in fact, some portions of it are a pure sand, while other portions have a good, stiff, clayey soil, with a large percentage of rich, vegetable mold, and the settler can find about any kind of land he wants, if he is not in too big a hurry, and does not get the one fixed notion into his head of getting that black, rich-looking soil that might properly influence his choice North. In regard to wheat, I must say I've not seen a grain of wheat either growing or in seed since I have been here, and the only evidence I have had of the existence of such a cereal is, that I've had to pay $8.50 per barrel for flour since my arrival here. Corn, when there is a favorable season, is raised pretty generally throughout this and other counties, but this year and last, there was none, all who fed their horses using shipped corn costing from 90c. to $1.10 per bushel. None was raised last year, because the weather was too wet. This year it has been too dry. The average yield of corn is from five to eight bushels per acre on unfertilized land. These are not immigration figures; if they were, I should have to say from 20 to 30 bushels per acre, but I think the average farmer here will say my statement is the truth, although I believe I saw somewhere the statement that our esteemed Governor Drew made, I think, 100 bushels to the acre, but the statement did not say how many hundred bushels of cotton seed he used as a fertilizer. But all who are acquainted with him know full well he is a great advocate of heavy manuring. Irish potatoes are raised in small patches, the owner having a few for dinner each day during the space of a month or six weeks. The sweet potato seems to be in its native soil here, there being some variety of this class suitable to all lands, from the richest hummock to the poorest pine. They yield well, and form a large share of the vegetable portion of our diet. If the settler can't eat them, he is indeed badly off, for he will find they are almost his only change from the palmetto cabbage. To those who have read Chas. Reade's story of "Foul Play," it might seem strange that a dying sailor should wish for a palmetto cabbage when cast away on one of the islands of the Pacific, but after indulging in the dish myself, I confess to partially sympathizing with the old sailor's longing.

Now, I would not be understood that there are no vegetables grown here. Cabbages do well. If sown in a seed-bed about September and then transplanted as in the North, about January, February and March we can indulge in that vegetable delicacy, and, as most of the cooking can be done out-of-doors, we are free from that odoriferous emanation from the basement, which tells of "corn beef and cabbage for dinner" at the North. The capabilities of this part of the State for "truck" are not yet known, there being no real market gardeners here. Some efforts are very successful; others, again, are failures. I've seen good turnips, and some common long radishes—the latter as large as a child's leg, quite sound and not spongy in the least. Our vegetable crop, however—if a few small patches may be called a crop—is all made and eaten while folks up North are frozen in, and snow lies on the ground three or four feet thick.

Oats I have seen here, but only about seven acres, scattered about in patches of an acre or so, but although furnishing fodder, I believe they did not mature, but their owners claimed they would have done so, had the season been favorable. Sugar-cane apparently does well, and is a standard crop with those who have the land adapted for its profitable culture. Tobacco is a crop that is neglected here, and yet the country and soil are adapted to the growth of the finest grades, but I suppose its neglect as a crop, is due to the fact that so few understand the process of curing the plant properly. If some of our Connecticut tobacco growers were here, perhaps they might find it profitable, but not being quite "posted" I should not like to speak positively on the matter.

Everybody, I suppose, knows that here the orange is the only remunerative fruit crop—how remunerative depends upon the same conditions that influence other fruit crops, such as the picking, handling, boxing and shipping, etc. Nearly every one will say something different in regard to the profit of this industry. I believe this is just about the right location in the State for the purpose of orange growing, although every body else has the same opinion of his own particular location. Certain it is that nearly every settler has some trees, from the man with his grove of three thousand bearing trees to the man with his twenty two-year-old seedlings. Sometimes I am inclined to wonder whether it would not have been best to have left the State of Florida as it was, a cattle range, for it puzzles the northern farmer when he first arrives here, to know what to do, as everything is so different from what he has been used to, but when he sees the well-cultivated grove of orange trees, it is apt to settle his mind on one thing, and that is that all varieties of the citrus family do grow well. To the man of means the orange, the lime and the lemon, with the various kinds of citrons, set out in groves of 500 or more trees, are nice things to see and to own, but these will scarcely do for the poor man. Yet how much better these groves are in appearance to the interminable stretches of primitive saw palmetto land which wearies the eye day in and day out!

The Banana is a fruit that seems to do well here and is worthy of more attention and cultivation than it now receives; for it can be served on table in so many ways and would to such a large extent take the place of vegetables; yet but a small acreage is devoted to its cultivation. The Pine-apple has, in a few isolated cases, been experimented with, and that successfully too; but there has yet been no effort made in this section to cultivate it for profit. The Guava is abundant and takes the place of the Peach here, and to a large extent is very similar. It requires a cultivated taste, but the necessity for anything in the fruit or vegetable line, soon sets the newcomer nibbling at anything of that sort, and he readily learns to relish what he only tolerated, or abused, at first.

Florida is a wonderfully "spotted," land with capabilities almost entirely unknown, but, these if we judge by the talk of special enthusiasts, are absolutely unlimited. I say "special enthusiasts," because some come down here with the idea of investing in the business of raising fibrous crops such as Sisal hemp, ramie, jute, and in fact every fibrous plant meets here with the special approbation of some one, and the sight of a few plants assures each that this is just the place for his special business. Another newcomer thinks that the production of the various high-priced drugs is just what will make him rich, and a few poppy plants and specimens of the Turkey rhubarb are all he needs to cause him to talk enthusiastically of the State of Florida in that line. Well, so be it; enthusiasm has done more for the world's progress than most of the other peculiarties associated with the history of mankind. No doubt it will help to develop the resources of the State of Florida. But in the mean time we'll settle down to our "hog and hominy" and quietly wait for the good time that's coming. "KASPER."

Manatee, Manatee Co., So. Florida, June 24.

NOTES FROM MINNESOTA.

MINNESOTA has long had—and still has in the East—the reputation of having a very cold and severe climate. After reading the crop reports from the Eastern States, I should feel as though I had left a "duty undone" if I did not write to the RURAL and give its readers some particulars in regard to our State and climate.

Minnesota ranks the 19th in the order of admission to the Union, and the 28th according to population. Geographically, it is situated between latitude 43 deg. 30 min. and 49 deg. 24 min. north, and longitude 89 deg. 39 min. and 97 deg. 51 min. west. Its extreme length from north to south is 380 miles, and its breadth, from 185 miles in the middle to 262 miles on the south line and 337 miles near the north line—area, 83,531 square miles.

The State is divided into 76 counties. The population was 6,077 in 1850; 172,023 in 1860; 250,099 (State census) in 1865; 439,706 in 1870, including 438,257 whites, 759 colored and 690 Indians. The estimated population on June 1, 1873, was 550,959.

Lying nearly at the center of the continent, and occupying the most elevated plateau between the Gulf of Mexico and Hudson Bay, Minnesota forms the watershed of the three great river systems of North America: that of the Mississippi, that of the St. Lawrence and that of the Red River of the North. Generally the surface of Minnesota is an undulating plain, with an average elevation of nearly 1,000 feet above the sea, and presents a succession of small rolling prairies, or table-lands, studded with lakes and groves and alternating with belts of timber. Minnesota is distinguished for the number and beauty of its lakes. They have been estimated as high as 10,000 in number and are from one to thirty miles in diameter. Their waters are sweet and clear and abound in fish. The soil is fertile, two-thirds of the surface being well adapted to the cultivation of all the cereals and roots of the temperate zone. It is composed generally of a dark, calcareous loam, abounding in organic and saline ingredients, and is retentive of moisture.

The climate of Minnesota is pleasant. The winters are cold, but clear and dry, and the fall of snow is light. Last winter we had only three days' sleighing in this country. The summers are warm, with breezy nights, during which occur most of our rains; and the purity of the air and salubrity of the climate recommend it for the residence of invalids. In 1873 the number of acres of land under cultivation was 2,383,672. Thousands of acres have been broken and put under cultivation since that time, but I have not the figures at my command at this moment.

Riding through the country as I do daily, I have the best of opportunities for observing the crops. Wheat is heading out, and stands well on the ground. We have rain enough to wet the ground thoroughly, and if we have none from this time until after harvest, wheat will not suffer. Corn stands from eight to fourteen inches high in the fields, and farmers have cultivated it for the second time. Potatoes look well; are well up, and indicate an immense yield. Rye is getting ripe. Barley also. Strawberries have been in the market since June 10. Gooseberries were in market on June 23. I had new potatoes and green peas from my garden on the same day. My Blunt's corn has grown so that by stretching up the leaves, it is six feet high. G. D. S.

Le Sauer, Le Sauer Co., Minn.

RURAL SPECIAL REPORTS.

VERMONT, Bellows Falls, Windham Co.—Of wheat there is but little sown here, but that little looks well. Corn is looking fine, but it is backward; the acreage is large. Early-planted potatoes look good, but there are ten bugs to every prospective potato. As to fruit, for the "off year" the prospect is fine. Hay is being cut; a middling crop, but, with the foregoing prospects, farmers are grumbling. M. W. D.

CONN., Danbury, Fairfield Co., July 7.—The weather has been quite cold, with plenty of rains. Grass, oats and potatoes promise abundant crops. Potato beetles are very plentiful. What little wheat is sowed in this section is looking nice. Corn is unusually small, but standing even. Apples will be scarce. Small fruits promise to be more abundant. G. H. K.

N. Y., Carlisle, Schoharie Co., July 4.—We have had a fine and much-needed rain. Crops are growing fast just now. Grass and the small grains will be fair crops. Corn, however, will be backward, owing to the cool spring. We have had a few very hot days, but after every little rain the weather becomes cool. Potatoes look fine, and plenty is planted. H. J. S.

PA., Ponghtown, Chester Co., July 1.—Haymaking is going on rapidly about here, and wheat-cutting has begun, and if the weather continues favorable the crop will be gathered in ten days. It stands thick, and is a good crop. There is a large yield of hay. Corn looks good, and is three feet high. D. H.

OHIO, Toutogany, Wood Co., July 7th.—We have a very early harvest and wheat never looked more promising; some wheat was cut in June; and we are about one-third done. Oats are very rank. Corn is from two to six feet in hight. Potatoes are doing well, and there are but few bugs. Hay is an average crop. There are not many apples, but other fruits are in abundance. Live stock was never in better condition. Wheat is worth $1; oats, 25; potatoes, $1 25; live hogs, $2 75 per 100 pounds and scarce. Improved land is worth from $40 to $125 per acre, according to quality and location. Wages are from $15 to $18 per month. Harvest hands get $1 50 to $2 25 per day. Temperature, 50° to 104°. S. P. G.

MICHIGAN, Litchfield, Hillsdale Co., July 9.—Our wheat is a fair crop and is ripening up fast; some have already begun to cut. We had a cold, dry spring, like many other places; but since the middle of June we have had fine growing weather. Our corn was a little behind, but is now making up for lost time, and bids fair to be a good average. The hay crop is short. Potatoes are promising a big crop; we have been eating new ones for the last three weeks. I think whoever expects to get rich by selling potatoes this fall, will be disappointed; he may get fat, but not wealthy. I have twelve different kinds of corn planted—all are doing well. On the 21st of April I planted 24 hills of the Blunt corn which I received from the RURAL office. I put three grains in a hill, and they now stand from seven to nine feet high, with no sign of a tassel. Where the upper end will be I cannot tell now. Some stalks measure six and seven and a half inches around, six inches above ground. This may seem a big corn story to some, but 'tis true, as I have measured the corn myself. My Pearl Millet I planted or rather drilled a little too early. It did not come up well, but what came up is now showing what it can do. I never saw such a big thing come from so small a seed—it is now two feet high. G. K.

WIS., River Falls, Pierce Co., July 1.—Wheat in this section of country is a little below the the average. Corn is light, but it is looking better than it did a few weeks ago. Potatoes are a fair crop. Cherries are ripe. Of apples we've only a few; but there's a prospect of an average crop of grapes. Other small fruits are very abundant. S. W. H.

MINN., Frontenac, Goodhue Co., July 2.—Wheat looks well all through this section of the country, and if nothing happens to it, there will be a heavy crop; but we are having so much rain and hot weather, that I am afraid there will be considerable rust. Corn is rather backward, owing to wet and cold weather in May; but it is making good headway now, and if this and the next two months prove favorable, we shall have a good crop yet. Potatoes have not been better for the last ten years. Beetles have done no damage so far, and if they stay away through harvest, we shall be sure of a big crop. The fruit crop will not be worth mentioning—late frosts cut that short. F. J. S.

IOWA, Marengo, Iowa Co., July 2.—Wheat hereabouts is light, owing to dry weather in the spring. The prospects for corn are better than for several years. Potatoes will be an A No. 1 crop. The beetles have put in appearance, but in such small numbers that no danger is apprehended from them. Apples are almost a failure; but there is an abundance of small fruits. Prices of produce are rising, and the business outlook is encouraging. S. B. B.

MO., Gallatin, Daviess Co., July 1.—Northwest Missouri is now receiving rain enough to make up for the long dry spell. From May 20th to June 10th it was seasonable. On the night of the 10th of June we had here the heaviest rain we have had for ten years, with a big hail-storm that cut up growing crops badly, and it has been raining every two or three days since then. The wheat is standing dead ripe in the field or rotting in the shock. There is no chance to save it; but the corn (our main crop) was all clean when the wet weather set in, and it is now growing at a wonderful rate. We *never* had such a prospect for corn, at this time of year, in Daviess county. "Beauty of Hebron" and Early Rose potatoes, planted at same time, are about the same size, but the Beauty turns out about 50 per cent. more, and is 100 per cent. better than Early Rose, being fine and mealy while the Rose is waxy and hard. We shall have but very few apples, no peaches, about one-sixth of a crop of late cherries, no early ones, plenty of Concord grapes, very few gooseberries, half a crop of black raspberries, no blackberries, and half a crop of pears. All kinds of garden stuff, not cut by the hail, are A No. 1. From my garden we have to eat peas, beans, beets, cucumbers, cabbage, green corn, etc. Tomatoes are beginning to ripen. S. T. B.

NEB., Grand Island, Hall Co., July 5.—The weather continues very wet. Wheat is a fair crop; barley is middling; oats, excellent; corn, magnificent. My premium corn is about four feet high; the ears are setting; it was planted May 14. I mulched it to-day; it is suckering very freely; its color is a dark green, and it promises well. E. T.

KAN., Wichita, Sedgwick Co., July 3.—Since my last report, two weeks since, the weather has been quite favorable, and corn is looking *up* fast, tasseling out and from six to eight feet high and still growing, and a few showers at the right time this month will make the largest corn crop ever raised in this State. Wheat is pretty much all in stack, and in good condition; but the chinch bug has helped to reduce the yield and value quite largely—in a few instances causing the loss of the entire crop, and doing great damage to corn and oats. I see no reason for changing my former estimate of one-quarter to one-half of an average crop for Sedgwick, Sumner, Harper, Kingman and Harvey counties. Oats will be a light crop. Early potatoes are at a standstill and setting new ones, when not half grown, and are now selling at $1.50@$2.00 per bushel in town. Everything is backward but corn. No fruit of any kind, except berries. Wheat, old, 75c.; oats, 30c.; corn, 25@30c.; hogs, $2.90@3.25. J. C. D.

KAN., Topeka, Shawnee Co., July 3.—Regarding crop prospects, everything is in flourishing condition at present. A great abundance of rain has fallen in the past few weeks, and all crops look *well*. The wheat crop will fall short of that of last year. It is yet too early to make any *reliable* estimate of yields. Corn prospects were *never better*. A. G.

CAL., Bird's Landing, Solano Co.—The crops of this section are chiefly grain, and they are very good this year. Very little fruit, corn or potatoes is raised here. The grain in some sections of the State is a failure; in many places there is only half a crop, while in some other sections there is none. In some parts of this county the grain is injured by rust; but take the State through, the prospects are good. T. T. H.

CAL., Woodland, Yolo Co., July 1.—The wheat in some parts of the county, is injured by rust; but the average is very good. Very little corn is raised in the county. The potato crop is very good. Fruits of different kinds are plentiful and cheap. J. F.

OREGON, Shodd Station, Linn Co., June 23.—There was not as much wheat as usual sown

this spring, as the weather was very wet. Some was sown in June, but we can't expect much from that. Winter and early-sown spring wheat looks fine. With good weather, Oregon will have an average crop of wheat. The fruit crop was damaged somewhat by frost, and will not be a full average, but it would be thought a good crop in most places. It is too early to tell much about potatoes—gardens are very late. F. S.

OREGON, Salem, Marion Co., June 22.—The season here has been unusually wet. Farmers in the low lands are sowing as late as June 10. All kinds of growing crops look well. Improved lands in this vicinity are worth from $15 to $30 per acre. Prices of produce are: wheat, 82½c. per bushel; oats, 40 to 50c.; old potatoes, 75c.; new, $1.25. per bush.; butter, 20c. per pound; eggs, 20c. per doz.

B. S. W.

OREGON, Salem, Marion Co., June 21.—The crop prospects throughout the State are exceedingly good. Fall wheat is perhaps too far advanced, but spring wheat is looking fine. Fruits generally are good, I think. E. M. W.

KY., Owensboro, Daviess Co., July 6.—The Rural is sound on horse-racing at agricultural fairs; so is it also on the credit system and on all other subjects so far as I am able to judge. I don't like to hear or read anything about credit; for "I know how 'tis myself" and it makes me feel just as I imagine I should feel if my scalp were lifted. Wheat is over a good average in quality but the price is low—from 75c. to 80c. Mediterranian, Amber and Tappahannock are principally grown here, though some other kinds are being tried. The season is dry in this part of the county and wet in other parts. J. W. S.

ALA., Huntsville, Madison Co., June 30.—Our crops are suffering for rain. We shall not make more than half a crop of tomatoes.

P. H. M.

MISS., Port Gibson, Claiborne Co., July 2.—The occurrence of a cold snap about the time the fruit trees were going out of bloom, resulted in a failure of pears and peaches; there are only from one to two dozen defective ones to a tree. The same is the case with apples, except the common natives, which yielded fairly. Wheat is not planted this far down. Oats are not a general crop. Irish potatoes are a good crop; corn and cotton are average crops. Most of the fig trees killed to the ground by last winter's cold are coming out again; on trees not killed there is a good crop of second growth. The yield of strawberries was large. Many Roses—Lady Banks, and ordinary Roses—as well as Cape Jessamines, were all killed, but most of them are sprouting again. W. H.

TEXAS, Bandara, Bandara Co., July 1.—This is one of the most healthy counties in Texas. I've been here now eight months and have not yet heard of a death; or, indeed, of any sickness. Crops generally are as fair as in any county in Western Texas; but the past winter and spring have been the driest here in ten years. This town, the county seat, is situated on the Medina river, 45 miles from San Antonio. Strictly speaking, this is a stock country, as the whole county is mountainous, but the river and creek valleys are very rich farming lands, and a considerable quantity of wheat, corn and cotton is raised. From my own observation, this will be a bad year for crops, on account of the backwardness of the spring—we had no rain to sprout seed until May. I don't think wheat will average more than six bushels to the acre; oats, eight to ten bushels; corn, unless we have immediate rains, will be a failure. What cotton I have seen is about ten inches out of the ground and looks fine. All kinds of garden vegetables have been failures, except where they have been irrigated. A. S.

TEXAS, Dayton, Liberty Co., July 5.—We have had fine seasonable rains lately, and corn, sweet potatoes, and cotton are very promising. There are no signs of an exodus here. Our colored brethren have long since got over the forty-acres-and-mule doctrine, and are now satisfied that that happy state of existence can only be arrived at by hard labor, and are working accordingly. The mast is also encouraging so that, if the cotton-worm comes to destroy our patches, we shall at least have plenty of bread and meat. G. G.

The Querist.

ANSWERS TO CORRESPONDENTS

Applying Gas Lime to Wheat Lands.

T. T., Cambridge, Mo., has about 5,000 bushels of gas lime which he wishes to use on wheat land this fall. Some of the land is in corn now, and some in oats, and on a field of 15 acres there's a good crop of wild grass; some of this, too, he wants to sow to wheat, and he inquires how he can apply the gas lime to the land so as to obtain the greatest benefit from it.

ANS.—Gas lime contains sulphuretted hydrogen and other sulphur compounds which are poisonous to vegetation. But these compounds are rapidly changed by oxidation into harmless, if not useful, substances, leaving the lime in a condition of carbonate, or what is known as mild lime, with some sulphate. In this condition it is useful and beneficial. Two or three months' exposure is needed to produce this effect; so that if the gas lime is fresh, it would be unsafe to use it at present. The lime may be drawn on to the wild-grass land and left in heaps of three or four bushels, from which it may be spread as the land is plowed. About 100 bushels per acre of this lime may be used with about the same effect as 40 or 50 bushels of common caustic lime. If 2½ bushels are dropped exactly two rods, or 33 feet apart, each way, it will be equal to 100 bushels per acre, and a man can easily spread the heaps by throwing the lime 16½ feet from them, with a long-handled shovel. This is, perhaps, the best, easiest and most accurate way of applying the lime.

Jersey Reds, etc., etc.

A. L., Atlanta, Ohio, asks our opinion about Jersey Red hogs; 2, a cure and preventive of chicken cholera; 3, what variety of Strawberries would be best for family use. 4. He has about one-eighth of an acre of loamy soil, triangular in shape, so situated at the junction of two streams that the water can be kept high enough to keep the ground moist, and he inquires whether it would be suitable for a cranberry bed.

ANS.—We have had no personal experience with this breed, but their general reputation is good. Their origin is unknown, but they have been bred in portions of New Jersey for upwards of 50 years. They are of large size and capable of making a heavy growth, 500 and 600 pounds being common among them. A good specimen should be red in color, with a snout of moderate length, large lop-ears, small head in proportion to its size and length of body. They should be long in the body, standing high and rangy on their legs; bone, coarse; tail and brush, heavy. They are valuable on account of their size, strong constitution and capacity for growth. They are not subject to mange. They are probably descended from old importations of Berkshires, but they are now much coarser than the improved swine of that breed. 2. Whenever the fowls begin to droop and look sleepy an effectual remedy has been found to consist of three or four tablespoonfuls of strong alum water, repeated next day. Their food should also be mixed with the water twice a day for two or three days. Another cure recommended is one gallon of water to which has been added one ounce of bi-sulphate of soda; set it where the fowls can drink it freely. As a preventive, frequently clean the roosting places of the fowls and sprinkle them with lime or wood ashes. 3. We can only suggest. Different varieties like different soils and treatment. Borden 30; Prouty's Seedling; Charles Downing; Sharpless; Golden Defiance. 4. Yes—all attempts that we have heard of to grow Cranberries on uplands that cannot be flooded or watered, have proven, sooner or later, failures.

Queries of a Prospective Bee-Keeper.

Z. C., no address, intends to start in bee-keeping, and asks for some information on the subject. He inquires, 1, if there is a better hive than the Langstroth; 2, what the best and cheapest winter foods are; 3, how much honey an average swarm can make in a season; 4, whether honey is exported from this country, and if the market is likely to be good; 5, and, finally, he wishes to know the name of a good bee journal.

ANS.—1. It is a disputed question. The standard Langstroth hive is used by some excellent bee-keepers, while others prefer some modification of it, especially the form adapted to the Gallup frames, for a short description of which, see RURAL of July 5th. 2. The best and cheapest winter food is the best quality of capped comb honey. 3. It varies greatly with the year, locality, etc. A good swarm can produce 50 to 60 pounds. 4. Yes. 5. There are several periodicals on bee-culture. The American Bee Journal and Bee-keepers' Magazine are both good. They can be obtained through this office.

We would add by all means begin the business, but go slowly at the start. Half-a-dozen, or even two or three good Italian stocks are as many as the inexperienced should venture to begin with. Now is as good a time as any to buy bees. Obtain them from some bee-keeper near at hand, if possible, and be sure that each hive contains a young, pure and prolific queen. Five to eight dollars for each swarm is an average price at this season; the price depending, however, greatly upon the locality. A correspondent from Oregon recently informed us that there the price was $40 a colony. Get all the information on the subject that can be obtained. Read some good manual, like Professor Cook's Manual of the Apiary, or some other book treating of apiculture. Study the current bee literature to see how others are managing. Select some good hive and let that be the only style used in the apiary: but, above all, do not begin bee-keeping with the idea that it is a never-failing gold mine, which incessantly pours its riches into the apiarian's pocket without thought or trouble on his part.

The Cuthbert Raspberry.

W. H. H. T., Nashville, Tenn., says that he has seen the Cuthbert Raspberry spoken of as being hardy and a fine bearer, while the fruit is said to be high-colored, firm, and good for shipping and marketing: and he asks, if this report is true, where it can be purchased, as he wants it for market purposes. The Brandywine is his best berry, but it is almost too soft for shipping to a distance.

ANS.—What he has learned of the Cuthbert is true, as far as we can at present judge. Last winter it stood with us better than the Brandywine. We have scarcely any doubt that it will prove one of our most valuable market sorts. Plants can be procured of the following: J. T. Lovett, Little Silver, N. J.; the Messrs. Williams, Montclair, N. J.; E. P. Roe, Cornwall-on-Hudson; Ellwanger & Barry, Rochester, N. Y.; Dr. F. M. Hexamer, Newcastle, N. Y.; or of any of the dealers in small fruit, who advertise in the RURAL.

Miscellaneous.

A Subscriber, Luling, Texas, asks where, and at what price, can be obtained a good work on mythology; a good history of France, and one of England.

ANS.—Murray's Manual of Mythology, $2.25; Whik's History of France, 1 vol., $3; Green's short History of the English People, 1 vol., $1.75. There are many larger and, of course, more expensive works than these, treating more fully of the same subjects, but a fair knowledge of the topics can be obtained from these books, which are among the best of their kind. They can all be had from Messrs. Scribner & Co., of this city.

J. M. M., St. George, Utah, asks whether the suckers of Blunt's Prolific corn should be pulled or left on. 2. What will cure mildew on Grape-vines.

ANS—As far as the RURAL premiums are concerned, each competitor can do as he pleases with the suckers. The latest experiments go to show that there is nothing gained by removing them, though Mr. Blunt did so. 2. The remedy for mildew is sulphur. Dust it on in the morning while the dew is on the vines, or else sprinkle them first with water; otherwise the sulphur does not adhere very well.

W. S. T., Cornwall, Ontario, Canada, asks, 1, is it advisable to put wood ashes around corn at the second hoeing—his land is gravelly; 2, he has plenty of stable manure and some hen manure composted with leached ashes, and he asks whether it would be well to put some between the rows of Webb's New Kinver Mangolds, sown in ridges; 3, is it hurtful to prune apple trees early in July.

ANS.—1, Yes. 2, Yes, but it would have been better if applied before the mangolds were sown. 3, No.

M. S., Burdett, N. Y., asks for a remedy for gapes in chickens. He has tried everything that has been recommended for years past, but without success.

ANS.—Since you have tried every remedy and failed, it seems a hopeless task to write prescriptions. In a brevity in RURAL of June 7th we related the experience of a gentleman in Brooklyn, who cured his chickens of the gapes by dropping some dry caustic lime down their throats. Have you tried that? Within the last six months we have given as many recipes for this malady.

J. A., Port Colborne, Ont., Can., asks whether the riding saw advertised in the RURAL, as made by the Farmers' Manufacturing Co., is better or worse than that made by W. W. Giles, which was advertised in this paper some time since. Folks there got some of Giles's machinery last spring, and liked it greatly; but no reply has lately been received to letters written to him.

ANS.—It is the same machine, Giles having formed a stock company which is known by the above name.

A. R. C., Buffalo, N. Y., asks where he can buy the best superphosphate, and what is the the difference between phosphate and superphosphate.

ANS.—L. L. Crocker, of your city, will furnish an article that is what it purports to be. Bone dissolved in sulphuric acid, as often explained in this journal, is superphosphate. Bone alone furnishes a large percentage of phosphoric acid, and is therefore called "for short," *phosphate*.

H. N. M. (no address, once more), sends us specimens of a plant that is overrunning a cemetery in his vicinity, and asks its name; 2, how to exterminate it; 3, whether it spreads from seeds or roots.

ANS.—1. It is Cypress Spurge (Euphorbia Cyparissias). It is a native of Europe, but rapidly spreading here. 2. If mown frequently during the summer, it would soon disappear. Otherwise the sod would have to be plowed under. Now that it is forming seed would be the proper time. 3. Both.

W. H. D., Pavilion, N. Y., sends a flower and asks for its name; 2, what care should Pinus edulis receive through the winter; 3, what is the depth of Delaware Bay at its mouth.

ANS.—Weigela rosea, one of the plants of which we sent out seeds last winter. 2. Pinus edulis is perfectly hardy and requires no special care. 3. The main channel has from 35 to 75 feet of water.

C. D., St. Jean Deschaillon, sends a specimen of grass for name.

ANS.—Phalaris arundinacea (Canary grass). The Ribbon or striped grass of the garden is a variety of this, and when planted in low or wet soils, will soon return to the species, losing its variegation entirely. It should be cut early; it is not very nutritive. Cattle care little for it.

Mrs. H. A. P., Zanesville, O., asks what caustic lime is—she has asked her druggist, but he does not know.

ANS.—Lime before it is slaked is called caustic lime. Caustic means burning, and when applied to lime refers to its power of corroding animal tissues.

C. S., South Bend, Ind., asks the addresses of some first-class manufacturers of greenhouse and conservatory materials.

ANS.—Lord's Horticultural Works, Irvington-on-Hudson, N. Y.; Hitchings & Co., No. 233 Mercer street, N. Y. We do not know of any in the West, or we would gladly furnish their names.

W. H., Norwich—one of the seven in the U. S.—wants to know where he can buy some buckwheat.

ANS.—Of Peter Henderson & Co., 35 Courtland St. this city. Thorburn & Co., 15 John St. B. K. Bliss & Sons, 34 Barclay St. H. A. Dreer, Phil., Pa. J. J. H. Gregory, Marblehead, Mass.

C. T., Millerville, Ohio, asks how he can prevent birds from eating up his lettuce seed.

ANS.—Cover the seed plants with netting. We know of no other preventive.

Estimated value	$44.67	$45.01	$36.56	$41.84
Cost	33.00	36.00	31.00	32.00

287, 290, 291 and 292, were received June 9th, from P. M. Augur, Middlefield. 287, 291 and 292, were sampled from stock of Wilson & Burr, dealers, Middletown. 290 was sampled from the stock of Rogers & Hubbard Co., manufacturers, Middletown.

293, 294 and 295, were sampled and sent by the dealers, Buck and Durkee, Willimantic. Received June 20th.

S. W. JOHNSON, Director.

*Calculated from the price per 100 lbs., ($2.25) in Naugatuck. The manufacturer's price is $33.00 per single ton delivered on board cars in New Haven.

†Potash costs 3 1-7 cents per lb.

‡Cost in New York. The freight to New Britain was $4.00 per ton.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JULY 19, 1879.

ANNOUNCEMENT.

THE latter part of August we shall publish our Fair Edition. We promise, in advance, —life spared, — that it shall be the most costly if not the most interesting and instructive number of the RURAL NEW-YORKER ever published. We shall issue at least 50,000 EXTRA copies and ALL of our readers—our agents and the Secretaries of Fairs—are invited, indeed solicited, to send for as many copies as they are willing to give to their friends or to distribute. These will be cheerfully forwarded to any address free of any charge whatever.

OUR semi-annual subscribers are respectfully reminded that the price of the RURAL for six months is $1.10, not $1.00.

CROPS AND PRICES.

THE latest crop reports from across the Atlantic are much more gloomy than even those of last week. A fortnight ago the Mark Lane Express said: "Should rain continue, the hay crop will be useless, except as manure. The condition of wheat is unimproved. Barley in heavy land is nearly ruined. Nothing but the speedy advent of sunshine can prevent an almost general failure of the principal crops." On Wednesday last Mr. Mechi despondently reports: "Another week of flooding storms and low temperature has put the finishing touch to the agricultural disaster. It is now too late for crops to recover. On ill-farmed and undrained lands the matter is simply ruinous. Wheat will suffer less than spring crops." Thus it appears that the newspaper's disastrous anticipations have been realized, and that the outlook for the harvest in England is anything but encouraging.

The unfavorable weather that has proved so disastrous to English crops, has been nearly as fatal to those across the Channel. Already the Bank of France has raised its rates of discount in order to keep gold at home, in view of the prospective heavy drain of specie to this country in payment of the large quantities of grain needed to supplement her shortened harvest. It is expected that from eighty to one hundred thousand bushels of foreign wheat alone will be required to keep France from starving during the coming year. Reports from Spain, just received, indicate that that peninsula also must buy in our markets; and it is not improbable that, owing to the poor harvest, the ministry will be forced to admit grain, at least temporarily, free of duty. A tax upon the bread of a starving people is an anomaly in civilized countries in these days. Northern Italy has been swept by flood and storm, and its crops are, therefore, scanty, but those of the southern part of the country are said to be a good average.

The large deficit in the food supply of the Old World during the present year must be mainly supplied from the New. Large quantities of grain from past harvests are still held in Odessa and other Black Sea ports, and, according to Saturday's telegrams, there seems to be, as yet, no rush of buyers; but the prospects for the present harvest throughout the greater part of the Russian wheat belt, are so extremely disastrous that it is not improbable that a large portion of the reserved stock will be needed for home consumption. The ravages of storms and locusts there seem to have been far more ruinous than last week's reports indicated, and already the Czar's attention has been urgently called to the matter as a national calamity.

The crop reports from all over the country, which our friends have enabled us during the year to place before our readers, will give a fair idea of the ability of the New World to feed the Old. A few of our cereal products, such as barley, are, nearly everywhere, a trifle below a good average, others are injured more or less severely here and there; but, on whole, the harvest is pretty certain to be a good one—not an exceptionally abundant one by any means, but yet, in view of the fair prices almost certain, good enough to lift the agricultural community out of most of its troubles, and to place the nation at large on a firm road to prosperity. There is, however, an old saying which tells of the imprudence of "shouting before getting out of the woods," and it must be borne in mind that a great deal of the crops is still subject to mishaps from insect pests and the weather. Already the ravages of grasshoppers are reported to be exceedingly disastrous in the western counties of Minnesota and Nebraska, while recent storms have played havoc with the crops in several parts of Minnesota, Iowa and Wisconsin.

These mishaps at home and the advices from abroad have already produced a sharp advance in the prices of all cereals, as may be seen by our market reports, and it is among the probabilities that prices will go higher still. Of course, all the speculations on this head are subject to so many unforeseen contingencies that it would be imprudent to speak definitely on such matters where the conduct of others might be influenced by the utterance. Whoever might be able to prophesy unerringly with regard to the future prices of grain this year, could easily make his way to a place among the millionaires of the country. The safest course, therefore, is, from time to time, to place candidly before others all the circumstances likely to influence prices, and let each form his own opinion as to the reliability of any views expressed on the matter.

INNOCENT SUFFERERS.

IT IS our duty to protect the lives, liberty and property of our neighbors, as far as these are affected by us or by aught under our control. This no reasonable, honest person will deny. It is also true that we have no right to injure others by our unpardonable negligence, or by any unscrupulous schemes of selfishness. Rights never conflict; for one man's rights end where another's begin, and rights and duties are correlative. Still, many a man who might be insulted if told that he did not believe all this, is guilty of inflicting sundry serious losses and sufferings upon his nearest and kindest friends, by permitting what he could and ought to prevent, and by doing what any truly good and honest man would blush and shudder to do. If one remonstrates with such a person, the answer is: "Let me alone. I don't trouble you or your matters. I attend to my business; you go and attend to yours."

The importance of this evil in men's relations with one another is better appreciated when it is considered how utterly helpless the injured party often is. The law does not take cognizance of very many serious troubles of this kind. The public do not give them attention. Those who do not regard themselves as wronged, care little, or not at all, for those who suffer. If the law provides for such cases, it is too apt to be slow, uncertain, and disagreeable in its operation. Let us consider some of the evils which these unkind and heartless neighbors inflict:

One family is ever thoughtful as to the laws of health and disease. They observe cleanliness in everything. The cellar is kept dry and free from causes of malaria. No decaying matter is permitted to remain near the house. The vaults are always in good condition. The water is guarded against any foul drains. The sweet air finds no poison there. But near this house live people indifferent to all such important precautions. They crowd lumber and filth in the cellar and unoccupied rooms. They allow hot-beds of malaria to fester around the buildings. The servants, knowing nothing of the dangers involved, cast slops and offal here and there and everywhere. The children are unwashed candidates for infection. The chicken-roost, pig-stye and cow-stalls are near the window or the door. Dangerous forms of disease are thus engendered. The air is laden with the insidious poison. The school-house is tainted by the poor little unfortunates that live in the neglected house. An epidemic starts. Everybody is in peril. Typhoid fever prevails. The doctors are astonished. The careful parents, for no fault of their own, nurse their sweet children, and perhaps follow them to the grave. Who is to blame? Life is taken; aye, murder committed. It was done by the criminally negligent people who would not keep the simplest laws of health and life for themselves, their families, or their neighbors.

Various other illustrations might be given. One man has a flock of sheep; another man keeps a dog that kills them. Two men join fences. One has a fence that is proof against all things that would break in and injure the crops; but his neighbor neglects his part, permits the inclosure to decay until it is too low to afford protection; and hence the crops of both may be ruined. One man keeps his ground free of weeds; a careless neighbor suffers those on his land to mature, and the seeds to be borne over the adjoining fields by the winds or the birds. A mill-pond of little value sometimes destroys the health of the whole town.

What is the remedy for these evils? Let common sense be instilled into people till they can see their wicked negligence and wrong-doing. Let the better and kinder parts of society cry out against such unwarrantable violence to the rights of others. Let it be proclaimed that these unfaithful neighbors are guilty, in the sight of sensible persons, of that which involves not only cruelty, but turpitude, and sometimes robbery or murder.

We know one community—a town of over two thousand inhabitants—in which malarial disease rankled with terrible severity for a number of years. The cause was, it was thought, a pond that was near. After long efforts by a few, finally the town succeeded in inducing the owner of the mill to remove the dam. A luxuriant harvest of grass soon covered the rich, alluvial bottom. The demand for quinine, of course, greatly declined; and the health of the inhabitants was signally improved.

The evil complained of is seen in connection with the character and habits of the young. Some parents train their children to purity of thought, language and conduct. Other parents either teach or permit their offsprings to early learn vulgar or profane language, and divers base and polluting practices. In association in the schools or elsewhere, the corrupted ones communicate the virus of their own depravity to those who have been carefully guarded. Let faithful people persevere in the right way; do the most they can to prevent the evils that threaten them and theirs; and unite in the effort to enlighten and reform the guilty persons who are, by negligence or otherwise, doing so much harm.

THE IRIS—OUR NEXT SEED DISTRIBUTION.

AMONG hardy plants, we know of no other bearing flowers at once so large, so brilliant and so delicate as many of the species and varieties of the Iris; nor is there another that this can so truthfully be said of, that is so little known, so seldom seen in our gardens. We have no doubt that certain kinds of this genus will, when better known, command as much admiration as the most beautiful varieties of the exquisite Gladiolus. It is, indeed, a suitable and charming companion to this flower, and nothing can be more beautiful than beds filled with the Iris and Gladiolus alone. Especially is this the case from the fact that the Iris furnishes just those colors never seen in the Gladiolus.

We shall have more to say of the Iris in a few weeks, and write of it now only to say that we have secured enough of the seeds of Siebold's Japanese Iris to enable us to place it as one of the kinds which we shall offer in our next free seed distribution. It is conceded that as regards purity, richness and depth of color, this species is not equaled by any other of the entire genus. We are, ourselves, delighted with this happy selection, and we are confident our subscribers will also be pleased—the more as they learn of its surpassing beauty. It will grow quite readily from seeds, and the seedlings may be relied upon to produce an endless variety of colors and marks.

This species grows about two feet high. The flowers are often six inches across, sometimes deep-red or plum color with bright yellow bands upon the lower petals; sometimes white, sometimes speckled and lined; sometimes rose suffused with violet; sometimes purple with blue throats blotched and veined with yellow.

We have also determined upon five other kinds of hardy plants (or rather the seeds of them) to offer our friends; but are not yet prepared to speak of them more in detail. We hope to be able to present the entire list in the Fair number of the RURAL NEW-YORKER, which will be published the latter part of next month—but we cannot as yet promise so to do.

SOW TURNIPS IN THE CORN FIELD.—A little outlay for seed and a little time spent in sowing turnips in the corn fields, will furnish a large amount of feed in the fall, after the frosts have killed the grass. A half pound is enough for an acre. The turnips may be fed in the field after the corn is gathered. They will keep up the flow of milk in the cows and fatten the sheep. Pigs will do well on them. There is no cheaper way by which a farmer can add to the stock of late fall feed. The turnips which are not eaten, will make excellent manure in the spring, and are worth all of the cost and trouble several times over for this purpose alone. We are surprised that this crop is not more generally grown. The seeds should be sown right after the last hoeing, when the ground is mellow. The first shower will cover them.

BREVITIES.

LORD DERBY suggests emigration as the relief for the worst-placed tenantry of England.

WE have thus far heard of few fields of wheat that have been troubled with the Hessian fly.

DR. E. L. STURTEVANT, of the Scientific Farmer, praises in high terms the new strawberry "Hervey Davis."

OF all the plants now (July 12) in bloom in our grounds, the bees seem most fond of Rhus glabra laciniata, the sport of our common Sumach.

THE London Garden gives a colored plate of Lilium Parkmanni, which is as pretty as the Lily itself. This, as we have already stated, is a cross between L. auratum (male parent) and L. speciosum rubrum.

THE editor of the American Rural Home "doubts if cheap potatoes will rule this year," which is the reverse of the prediction of the RURAL NEW-YORKER founded upon reports from all parts of our country.

GOOD men will work harder for a kind, considerate employer than for one who is ever petulant and dissatisfied. This is human nature. It is generally easy to determine the character of the employer by the character of the men he employs.

MR. BEECHER says that people who want to raise fruit on the principle of not having any trouble, cannot do better than migrate to the next world. We should like to know if there is any reason to suppose that such people will fare any better there than here.

IT is time to sow turnips for winter supply, though crops may be raised in this latitude if sown as late as the latter part of August. One pound of seed is generally sown to the acre; half a pound if drilled in. In the latter way, make the drills a foot apart and thin out to six inches.

WE wish to sow a great many different varieties of wheat this fall and we would thank any of our friends if they would inclose in a a letter giving name, yield etc., any variety or varieties they may deem worthy of trial. We shall have any heads of special size or seeming merit engraved.

OUR readers will remember our illustration of the double Wistaria in RURAL of April 26. This, says the London Garden, is now in flower for the first time in Mr. Anthony Waterer's nursery, and is in all respects a decided acquisition as its blossoms are perfectly double and last a much longer period in beauty than the original with which it corresponds exactly in color.

SPEAKING of Heath plants in our last week's issue, reminds us of the Huckleberry which is this year so abundant about the Rural Farm and in many other parts of Long Island, that the many people who, during the season, busy themselves entirely with picking this fruit for market, have the promise of an unusually busy time. Huckleberry puddings and huckleberries and cream are standard dishes in New York restaurants, as well as in the homes of all native Long Islanders.

SINCE the dispersion of the Jews by Titus, A. D. 70, that race has never engaged in its chief occupation of old—agriculture. Last week a convention of the different Jewish congregations throughout the country assembled in this city, and the most notable project discussed was the advisability of founding Hebrew agricultural colonies, to which might be drafted the poor Jews that now eke out a scant livelihood in the cities. It was voted almost unanimously that money should be collected to found one colony as an experiment.

WE shall shortly present our readers with a life picture of that elegant little tree Acer palmatum dissectum rubrum. The fern-like leaves may thus be accurately shown—but the color which is nearly as dark as River's Purple Beech, can not, of course, be portrayed. We have until recently supposed the specific name of these Japanese Maples, polymorphum. But Mr. James Hogg, who is preparing an article to accompany our engraving, informs us that it is palmatum. But polymorphum, as applied to these Maples of so many forms, is peculiarly appropriate.

WE would remind our readers that all hardwood plants may now be layered. Dig a hole in the ground under the branch which is to form the layer, and then bend it down and cover with earth, so that it remains firmly in its place. Next spring the new plant may be removed. Thus all sorts of shrubs, Grape-vines, etc., may be propagated with little chance of failure. The time for budding is also upon us. As soon as buds can be procured, the only other essential condition is that the bark of the plant in which the bud is to be inserted, should part readily from the wood.

WE want our Young Folks to *study* the elementary botanical lessons begun last week by Uncle Mark. Our Youths' Horticultural Club is growing with a fine success, and we shall send the next seeds and plants to those members who show us they have made the best progress. We do not mean that this Horticultural Club of Youngsters shall be a mere trick to amuse them. We want to do them good and to have them feel in future years, when they have become successful or even eminent as gardeners, horticulturists or farmers, that the RURAL NEW-YORKER first "bent the twig." Now, good parents, help along our worthy project.

Literary Miscellany.

LITTLE FEET.

BY FLORENCE PERCY.

Two little feet, so small that both may nestle
In one caressing hand—
Two tender feet, upon the untried border
Of life's mysterious land.

Dimpled and soft, and pink as peach tree blossoms
In April's fragrant days.
How can they walk among the briery tangles
Edging the world's rough ways?

These rose-white feet along the doubtful future,
Must bear a woman's load;
Alas! since woman has the heaviest burden,
And walks the hardest road.

Love for a while, will make the path before them
All dainty, smooth and fair—
Will cull away the brambles, letting only
The roses blossom there.

But when the mother's watchful eyes are shrouded
Away from the light of morning,
And these dear feet are left without her guide,
Who shall direct them then?

How will they be allured, betrayed, deluded,
Poor little untaught feet!
Into what dreary mazes will they wander,
What dangers will they meet?

Will they go stumbling blindly in the darkness
Of sorrow's tearful shades?
Or find the upland slopes of peace and beauty,
Whose sunlight never fades?

Will they go toiling up ambition's summit,
The common world above?
Or in some nameless vale, securely sheltered,
Walk side by side with Love?

Some feet there be which walk life's track unwounded,
Which find but pleasant ways;
Some hearts there be to which this life is only
A round of happy days.

But they are few. Far more there are to wander
Without a hope or friend,
Who find their journey full of pains and losses,
And long to reach the end.

How shall it be with her, that tender stranger;
Fair-faced and gentle-eyed,
Before whose unstained feet the world's rude highway
Stretches so strange and wide!

Ah! who may read the future? For my darling
We crave all blessings sweet,
And pray that He who feeds the crying ravens
Will guide the baby's feet.

[*New Orleans Times.*

AN UGLY GIRL.

(Continued from page 445.)

CHAPTER XXXII.

THE HEIRESS AND HER CONFIDANT.

From the window of her favorite sitting-room Miss Carlsforde watched the departure of her kinsman; she was still leaning against the window-frame, her eyes half-closed, her attitude expressive of the greatest despondency, when Clement Dunforth entered the room and eagerly approached her.

"Then you have routed the enemy, my dear Miss Carlsforde?" he exclaimed. "Accept my congratulations on the firmness with which you have behaved."

"Routed an enemy, did you say?" she responded, bitterly. "I feel as if I had driven from me my best friend. Oh! Mr. Dunforth, may Heaven forgive you, for I never—never can, if you have induced me to wrong my cousin!"

The young man raised his eyebrows and took an injured tone directly.

"Miss Carlsforde, this is a strange speech to address to me, the friend of Noel. Have I not pleaded for him? Have I not striven to palliate his conduct? Did I not refuse to believe that he could have intentionally acted with such treachery, till you grew angry at my obstinacy? When I spoke of Noel as I did just now, it was more in pity than in scorn, for I shall always maintain that he has been his own enemy more than yours."

"If he would but have cleared himself!" she murmured.

"And he could not? I feared as much. Why, then, do you not try and dismiss him from your thoughts?"

"Is it so easy to forget those we have liked?"

"Yes," was the reply. "It ought to be, when we have convinced ourselves of their unworthiness. Were I in your place, it would drive me mad if I heard Noel Carlsforde boast that he could have won me if he had thought the game worth the trouble."

"He dare not do this!" exclaimed Hillian, growing pale with anger.

"I hope he will not, for his own sake," hissed Clement Dunforth through his teeth; "but we must not forget that he can take terrible advantage of the unguarded manner in which you, my poor friend, have behaved. Your keeping him here—your waiting on him in the character of an upper servant—your secluding yourself from everyone else, will all give food for his insinuations, and the world is always so ready to believe any tale that reflects upon your sex."

Before he had finished speaking, Hillian had slid down to the nearest chair, and was hiding her face in her folded arms. Every word he said was spoken deliberately and with telling effect. Since she had known Noel and his sister—since she had discovered that she was not as repulsive in appearance as her father's exaggerated remarks on her ugliness had led her to think, she had felt many yearnings to be known and loved, and to be able to take part in society and its pleasures. She had also learned to value the opinion of her fellow creatures; to comprehend that she must not sin against the *convenances*, and the hints that, in her seclusion, she could have afforded to despise, now humiliated her terribly.

At last, in her desperation, she started up and turned upon the hand that stung her.

"Why do you tell me these things? Was I not unhappy enough? Have I ever known any peace of mind since your revelations taught me that Noel Carlsforde was not what he seemed?"

"Did I make those revelations willingly?" asked Clement Dunforth. "Did I not entreat you not to question me? Have I not offended my friends, thrown up my situation, and risked my prospects, that I might be near you, and aid you to the best of my ability?"

"Yes, you have been very kind," sighed Hillian; "and I am not unthankful, though I sometimes wish you had left me in ignorance of the truth."

"Why would you not let me do so? You saw how it grieved me to be compelled to denounce my friend. But no; I cannot call him by that name now I see that he meditates such cruel reprisals."

"What do you mean?" Hillian breathlessly demanded.

"Do not ask me. It would pain you too much to hear it. Why are you so lonely? Why is there no one to protect you from the shame—the scandal—the newspaper paragraphs, with which your fair fame will be assailed?"

Miss Carlsforde wrung her hands.

"Ah! why, indeed, am I so friendless? Why cannot I die, and so escape the misery I am enduring—the torture with which I am threatened?"

Clement Dunforth suddenly threw himself at her feet.

"Miss Carlsforde—Ada—you shall not be left to the cruel mercies of the base and heartless. There is one who has not only pitied, but loved you from the first moment of our acquaintance—one who would lay down his very existence to shield you from sorrow. Give me the right to be your protector, and I will take you out of reach of all these petty troubles and annoyances. As my wife you will be safe; not a word will anyone presume to say to your discredit; and in the smiling scenes of Southern France or Italy I will teach you to forget all that now grieves you."

"Impossible!" cried Hillian, the color sweeping over her face and brow. "You cannot know what you are saying, Mr. Dunforth."

"Not know that I am asking you to be mine? Is it not to rescue you from your present unhappiness that I have broken the bonds I had imposed on myself?"

"Hush! sir. You are affianced to another!"

"To Irene Estcourt! No; my letter annulling an engagement too hastily entered into is now in her hands. Ada, you and I were made for each other. Fate has destined that we should be united. I alone can save from the machinations of Noel Carlsforde, and the disgrace with which he thinks to blight you. One word from your lips—only say, 'Clement, I consent,' and your enemies are mine. I will not only defy, but defeat them."

"I shall never marry," faltered Hillian; "and if it can be true—and I know not how to believe it—that Lord Carlsforde will use me thus, I will defeat such malice by going away, and ending my days in some obscure corner of the world where no one can find me."

"You will not be permitted to do so. Your wealth renders you of too much consequence. Ah! why do you hesitate? Must I tell you the worst? What will you do if Lord Carlsforde construes your eccentricity, as he called it when speaking to me, into something worse, and you are seized—confined in an asylum?"

Hillian screamed faintly, and recoiled, but quickly recovered herself; for now the treacherous Clement had overshot the mark.

"He will not attempt this. Do you know that the more I dwell upon his manners as well as his words during our last interview, the more I feel convinced that there has been some strange mistake—that he is still the noble, upright man I thought him, till you came to Carlsforde."

Clement rose, and, with folded arms and threatening brow, asked if it was his fault that she had changed her opinion of her kinsman.

"I don't know; I hope not. I am not feeling well. If you would kindly leave me, Mr. Dunforth, I shall be obliged.

"With the question on which the whole future of my life depends still unanswered. Do you ask me to do this?" he demanded.

"Then I must, at all risk of giving you pain, tell you once again that it is impossible," she firmly replied. "I cannot be your wife. Had I imagined that you would ever have thought of our union, I should have put an end to our acquaintance long since. I have always regarded you as the bethrothed of Irene my friend!"

The last words were spoken so deliberately that Clement bit his lip. But he caught her dress as she would have slid past, and, compelling her to listen, he urged his request till she was faluting with agitation.

But even then he pleaded in vain.

"I will never marry; I could not love you. I dread the shame with which you say I am threatened; but I will never consent to involve another in it," was all she would say.

At last, Clement Dunforth was obliged to see that the gentle, yielding girl, over whom he imagined that he had obtained unbounded influence, could be firm enough when it was necessary. He could make her weep and wring her hands, and long for death rather than encounter the troubles he predicted; but he could not extort from her the little "Yes" he sought to obtain.

At last his patience gave way, and, grasping her arm, he said, in menacing tones:

"Ada Carlsforde, I would have spared you the last arrow in my quiver, but you will not let me. You must be mine—you have no alternative; for I have a secret of yours in my keeping which will ruin you, unless you seal my lips with this little hand."

She looked at him wildly. What did he mean?

"Do not compel me to tell you. Only say, 'Clement, I am yours—to you I confide my future,' and no one shall ever know or even suspect the truth."

"You terrify me!" she gasped. "But I do not value my life well enough to care how it passes and I should be as unhappy if I were your wife as I am now. Pray cease, Mr. Dunforth; you shock me. If I must be frank with you, sir, you are beginning to disgust me. There is no disinterested love for *me* in your looks or words. I thank you for not feigning any; but is it possible that you are deliberately pursuing the line of conduct which you induced me to think Lord Carlsforde was taking?—seeking to marry me for my wealth, and to cast shame on me, that I may be repudiated as soon as it can be done with decency?"

"It is not in my nature to ill-treat a woman," said Clement, coldly.

"Then cease to persecute so helpless a one as I am," Miss Carlsford retorted. "If you have been truly my friend, I will find some way of proving my sense of it; but not as you propose."

"But if you must, if there is no other course open to you?"

Seeing that she looked incredulous, he stooped and whispered something that made her spring up, and demand, as well as her chattering teeth would let her:

"Is it true?"

"It is," he answered; and would have put his arm around her, for she seemed about to fall; but, pushing him aside with resistless force, she fled from the room.

Clement waited awhile, then pencilled a few lines on the back of a card, entreating her to return to him, or say when she would see him again.

"To-morrow morning, at eleven," was the reply brought to him; and, satisfied that Hillian acknowledged his power at last, he went away.

Long before the appointed hour he made his appearance, and bade Jephson tell his young lady that he awaited her. But the man lingered.

"It was Mrs. Hurst sent you that message yesterday, Mr. Dunforth. I don't think Miss Carlsforde knew anything about it. She had shut herself in her room, and the old lady did not like to disturb her."

"It does not signify; tell her I am here."

"But I can't, sir," was the disconcerting reply; "for she left the Park yesterday evening; and where she's gone to is more than I or anyone in the house can say."

CHAPTER XXXIII.

AT HOME AGAIN.

Noel safely reached London, and was welcomed with such unfeigned joy by his half-sister, that for a time he forgot the gloomy thoughts that had made his journey a most depressing one. Mrs. Estcourt, whose many fancied ailments had been set aside by a really dangerous illness, from which she was but just recovering, was more subdued, more affectionate than he had ever seen her before; and Irene, though worn to a shadow by fatigue and anxiety, struck him as being greatly improved by the time of trial, she had passed through, almost unaided.

It was not till all Mrs. Estcourt's inquiries about Carlsforde Park had been answered, or evaded, and the children persuaded to believe that Noel was not strong enough to endure their boisterous caresses any longer, that Irene was able to have him to herself for the long confidential talk on which she was building. Yet, when there was nothing to hinder it, both the brother and the sister were strangely silent. Irene could not bring herself to speak of Clement Dunforth, and Noel shrank from the painful task of revealing Hillian's identity with Miss Carlsforde, and the distrust with which she had been taught to regard him.

The ice was broken, however, by his inquiry after Irene's much admired friend, Miss Jenkins.

"I quarrelled with her," was the reply, "just after I came back to mamma, because she bluntly told me that her cousin would never have asked me to be his wife, if he had not learned at the office, in which he is employed, that you were heir to the dying Lord Carlsforde, and that there was every prospect of my being well dowered. I said it was false, that I could not believe it of him."

"But I can," responded her brother, bitterly. "Forgive me if I pain you, dear, but Clement Dunforth is not worthy your companionship."

Irene sighed, and let her head droop on his shoulder.

"I have no right to be angry with him, if he has found out that I am too silly and ignorant to make him a good wife."

"My dear little sister, Heaven forbid that you should throw yourself away on a fellow, to whom in all good and right feeling you are so immeasurably superior!"

"We'll not talk of him," said Irene, dashing away a few tears. "I feel as if I were five years older than when I jumped at the idea of being a married lady, and having a dear little home of my own. Since I came from Carlsforde, I have thought a great deal, and it has made me wonder at myself that I could have been so selfish as to wish to leave poor mamma and the children. If she—well, I may be frank with you—if she were wise, and could manage for herself, of course I could be spared; but with her helpless ways, and the little ones looking to me for everything, it would be cruel to go away from them."

"But, on the other hand, my poor child, it will never do to let all your youth be wasted in struggling with cares that ought not devolve on your shoulders!"

And now Noel began to ask himself how he could quit England while his young sister was thus over-burdened. It would vex him very much to renounce his plans, for in change of scene he hoped to forget Hillian, as he still called Miss Carlsforde; but he was not one who lived for himself, and another glance at the thin and pensive face of Irene made him resolve, no matter what the cost to his own heart, that he would share her trials. To this resolve he determined to adhere—at all events, until Mrs. Estcourt's health was re-established, the little boys placed at some well-conducted boarding-school, and the companionship secured for Irene of some well-informed middle-aged woman who would undertake the education of Maggie.

On the morrow Irene took him into her room to proudly display the pretty cherry-wood wardrobe, with cheval-glass fitted into one of the doors, that had been sent to her shortly after her return home. On opening it, she had discovered that every shelf was full, and that for the first time in her life she was the proud and happy possessor of an excellent assortment of all those articles of clothing a young lady requires. In the neat dressing-case that accompanied this costly and yet useful gift, there was a note from Ada Carlsforde, entreating her little cousin to accept what it had given her unspeakable gratification to select.

"Hillian Gray never spoke very kindly of Ada Carlsforde," said Irene; "but for my own part I think she must be the most generous as well as the most considerate creature living. Who else would have thought of me at all?"

"Might it not be Hillian Gray herself to whom you are indebted for them?" asked Noel; but when she laughed incredulously, he said no more.

He could not make up his mind yet to tell her that it was for the very person of whom they spoke that Clement Dunforth had deserted her.

Dr. Monson made a journey to town a day or two after Noel left Carlsforde, to ascertain how his patient had borne his journey, and upon his heels came Herr Rudolsheim, whom the death of a relative was recalling to his native land.

"You will not go with me?" he queried. "Is the notice too short? Then you shall follow me when it is more convenient. I leave with you my address, and there shall be a welcome for you in the little house at Darmstadt, where I dwell with my good mother, whenever your plans admit of your journeying there."

"You left Miss Carlsforde well, I hope," Noel observed, as they were saying their adieux.

The Herr threw up his hands with an expressive gesture.

"She has gone—disappeared, carrying Mrs. Hurst with her; and the household is under military discipline, with Jephson acting as comptroller-general. That wonderful young man, Dunforth, is annihilated by a defeat so total. He has accused me of being in the young lady's confidence, of being cognizant of her movements; but I assure him upon mine honor that it is not so."

Noel was both surprised and sorry to hear that Hillian had taken this step; but as it was plain that the Herr was as much in the dark as he declared himself, it was useless interrogating him. There was, however, another subject to which he could not resist alluding.

"There is one thing I should like to know, Mein Herr. When you professed to raise spirits, was there no collusion between Miss Carlsforde and yourself?"

"Must I be candid, and say 'Yes?' In some measure there was. I will tell you all. I came upon her in the library one day; I had penetrated her secret: she was the daughter of my friend. I contrive to make her believe that I would be hers too. I discover in our long conversations that she had been taught to doubt you, and in my wish to make you understand each other better, I propose that I shall throw you into a mesmeric trance, in which you shall truly answer whatever she asked. Once brought together, I thought I should have wit enough to effect my friendly purpose; but, unfortunately, the few drops of an opiate I infused in the wine you swallowed acted too powerfully. You were ill; the *fraulein* was terrified, and I resolve in my heart to scheme no more."

Then they were Hillian's tears that had fallen upon his face; it was she who had shrieked so wildly in her fears that he was dying! Ah! she had loved him a little. Yet why did he rejoice to know this? Even if Clement Dunforth had not interfered, she would still be the heiress whom he was too poor and too proud to woo.

The Herr's visit, and the tidings he brought, effectually banished all the resignation on which Noel had been priding himself. For the remainder of the day, the image of Hillian, pale and tearful, her eyes reproaching him for deceiving her, haunted him. In vain he tried to shake off these recollections by plunging into business; going to the city, and seeking some occupation wherewith to supplement the small sum inherited from the late Viscount; for when, wearied as much by want of success as the long walk, he turned his steps homeward at dusk, he was more disheartened and dejected than he ever remembered to have felt before.

Irene's voice reached his ear as soon as he entered the house; she was talking cheerfully to the hungry children, whose wants she was supplying, as they sat round her at the tea-table. Feeling that his depressed look would be a check upon the little party, Noel turned into the front parlor, which was generally unoccupied at this time of the day.

It was not till he had reached the hearth, and stirred the fire into a blaze, that he discovered he was not alone. A female figure was hovering in the shadow, and at his start and exclamation, Ada Carlsforde came slowly forward, and stood before him.

"My lord," she said, hoarsely and rapidly, as if the strength she summoned for the task she had set herself was ebbing so fast that she must be quick or break down—"my lord, I bring you news, which perhaps ought to have been communicated through the lawyers; but they are slow, and I felt that you ought not to be kept in ignorance a moment after I had assured myself that they are correct. The Carlsforde estates are yours, not mine; I have no right to them. My father was laboring under a grievous error when he made that will. I have left the Park, and you can take possession whenever you think proper."

And then, gathering her veil over her face, she turned away. She had accomplished her errand—ay! and she had looked once more in the face of the man she loved. Hers had been the exquisite pleasure of relinquishing in his favor the wealth, that, unless he would have shared it, she could never have enjoyed; as for what would become of

herself, she had not yet tried to think; but leaving Noel stupefied by the tidings she had brought him, she went swiftly—silently away.—To be continued.

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER I.

A HANDSOME, lofty room, furnished in a formal manner with old-fashioned, well-kept furniture, including a center-table covered with gilt books and bead mats and empty vases, a square piano bearing on its closed lid several orderly piles of music books, and, ranged along the walls, an ample array of angular, drab-covered sofas and chairs. This was the drawing-room in Dr. Yorke's house, 106 George street, Woolchester.

The elderly lady who was knitting by the fire was Miss Elizabeth Yorke, the Doctor's aunt—a broad-built woman, with country color in her cheeks which twelve years of Woolchester air had not power to dim; clear, resolute eyes, and strong hands that had done good service in old days on her father's farm, and that even now, in her nephew's comfortable establishment, could not keep from furtive dusting, and china-washing, and pickling and preserving. Miss Yorke thought that she was not "cut out" for a lady, and found it very hard work to do nothing all day long. She liked sometimes to remind her nephew that he was the lucky member of the family, and that education was not thought so much of in her early days, when a woman was merely expected to be a good housekeeper, industrious, thrifty and neat.

Her niece, Miss Fisher, the young lady in elaborate mourning, who sat opposite to her with some lacework in her hands, had been brought up more in accordance with modern notions, having been "finished" at a boarding-school in Leamington, whence she had brought a small store of accomplishments by which Aunt Elizabeth was greatly impressed. The old lady listened complacently every evening while Gertrude played her half-dozen pieces and sang her half-dozen ballads; and she made a point of asking her niece to translate the odd words of French—*on dit*, *tapis*, *beau monde*, and so forth—which cropped up from time to time in the Woolchester Guardian. It was six months since Gertrude Fisher lost her father, and came to live with her cousin and guardian, Dr. Yorke; and already aunt and niece had begun to cherish a little romance, in which the unconscious head of the house played a remarkably prominent part.

Gertrude's music was over for that evening, and had failed to elicit any remark from her cousin, who sat in an easy-chair, with his hands clasped at the back of his head and his eyes fixed absently on the fire. The last number of the Lancet lay on the floor where it had dropped half an hour since, and the women were conversing in occasional sentences, unheard by his dreaming ears.

"I will go and match your wool to-morrow, aunt, if it clears up," Gertrude said, laying her work on the table and smoothing it out so as to judge of the patterns. "Do you think it will clear up?"

"I hope so, my dear."

"It always does rain when one wants to go out. I remember the very last time I went to that shop it poured." Tick—tick—tick, went the bronze clock on the mantelpiece; a gust of wind shook the house.

"Let us hope it may clear up before the morning," Miss Elizabeth remarked. "What do you say, Robert?"

"I beg your pardon, aunt." The Doctor sighed deeply, and turned round, passing his hand confusedly through his hair. "You said——"

"Really, Robert, I think you might exert yourself a little more for your cousin's amusement during the few hours you are home."

"I know I'm a bear," Robert returned, penitently. "But I—I have been rather tired to-day, and Gertie will teach me better manners in time."

Miss Yorke's face relaxed at this little speech, and Gertrude smiled on her cousin as he picked up the fallen paper, pitching it on the sofa, and stood with his back to the fire and his hands in his waistcoat-pockets. Gertrude had light hair and good, gray eyes. She would have been a nice-looking girl but that she was too buxom for her hight. Just then, however, while the affectionate smile was lighting up her face, she looked her very best, and Aunt Elizabeth, watching the cousins over her knitting, thought what a nice couple they would make.

"Your tea is quite cold, Robert," said the young lady. "Shall I give you another cup?"

The Doctor accepted the tea, and admired Gertrude's lace-work, which he had seen every evening for the past six months; but, having so far redeemed himself, he seemed in some danger of a relapse into silence, when a servant entered with a note on a salver—a note which for some reason or other produced signs of displeasure in Miss Elizabeth's face, and which the Doctor read eagerly and thrust into his pocket, calling out in strong baritone voice——

"Parker, my coat!"

"Robert—" Miss Yorke looked up sharply—"you are not going out?"

"I must. Probably I shall not be long."

"That woman again, I suppose! She might dispense with your services on a night like this. A sprained ankle is a not a matter of life or death."

"Perhaps not," the Doctor returned shortly, donning his waterproof. "Still, as Miss Carew is depending on her salary for her own and her brother's support, and as it is stopped during her absence from the theatre, the sooner she is able to return to her duties the better."

"How kind you are, cousin!" Gertrude said, looking up with eyes of gentle admiration at the Doctor's tall figure.

"Too kind," objected Miss Elizabeth. "Robert, you are not going to walk?"

"Of course I am. It is no distance, and I cannot keep the horses standing in such weather as this. Good night aunt. Don't sit up for me, in case I am detained. Good night, Gertrude."

"Try to come home early, cousin," Miss Fisher said, taking the Doctor's proffered hand with a very perceptible flutter. "You have not stayed at home one evening for a whole month, and——"

"You are keeping Miss Carew waiting, Gertrude, my dear," put in Miss Yorke dryly; and with an impatient shrug of the shoulders Robert dropped his cousin's hand, and went away.

Gertrude sighed, and resumed her lace-work; Miss Yorke's needles clicked angrily. The Doctor's impetuous feet were heard running downstairs.

"I am afraid he is annoyed," Gertrude said, lifting her head, startled, as the whole house shook with the slamming of the front door. "I'm sure I did not mean to vex him; but I'm afraid he is annoyed, Aunt Elizabeth."

"Let him be annoyed!"

"But he will think it is my fault, and I did not say anything, aunt, did I?"

"No, child; you are a great deal too kind and patient with Robert—he does not deserve such a faithful little friend."

"I dare say Robert finds our society dull after that—that person's at the theatre;" and Gertrude sighed.

"At least it is respectable, Gertrude. And I do think it is rather late in the day for Robert to begin to turn up his nose at the home I have made for him ever since his poor mother's death, twelve years ago—and all for the sake of some actress-woman he has not seen a dozen times."

"But, aunt, doctors must attend to their patients, must they not? I dare say when Miss—when that person leaves Woolchester, Robert will forget all about her, and be as happy as ever at home in the evening."

Miss Yorke pulled up sharply at a knot in her wool, but did not speak. This was a subject to which she had never before alluded in Gertrude's presence, though doubtless each lady knew quite well what was in the other's mind concerning it; but for once her annoyance had got the better of her prudence. It did indeed seem bitter to her, and not without reason, that her nephew, whose household she had ordered so faithfully for twelve long years, whose socks she had knit, whose buttons she had superintended, should be won away from her in one short month by a strange woman, about whose character or past life he could know nothing—that he should take to spending his evenings in the boxes of a dingy little theatre, neglecting his family and making himself an object of wonderment and gossip to his friends and patients. So steady as he had been too till now; and to think that when he had no longer the excuse of youth for his folly (Miss Elizabeth choked as she thought of it), he should bring this disgrace on the family—the proud, respectable yeoman's family that had owned its own farm, and the pleasant old home down in Lincolnshire, and had borne a spotless name for two hundred years and more, before young Robert Yorke took a fancy to be sent to college and to learn doctoring and to set up in practice for himself in the little garrison town of Woolchester! And here, at home, was a wife waiting for him—his own cousin—a girl with a snug little fortune to add to her other attractions—a girl sensibly brought up, who was prepared to make him happy!

"Well, thank Heaven," Miss Elizabeth thought, "the theatre will close before long, and then that brazen piece of goods will take herself off, and Robert will return to his senses!"

Ten o'clock struck; a servant entered with candles. Miss Yorke collected her work into a grim-looking basket, and the long day was supposed to be over for all respectable people.

"You won't sit up for Robert?" Gertrude asked, suppressing a yawn, as with a discontented air she took her candle and kissed her aunt's cheek.

"No, my dear. That is a thing your cousin has an unreasonable dislike for. He has his latch-key, and I dare say he won't be late. Good night."

Meanwhile Dr. Yorke, tramping along the deserted streets, was thinking, as he often had lately, in a maze of curious doubt and wonder, of the change that befell his life one day, not long since, when he was called in to attend this ill-paid provincial actress who had hurt her foot. He had never yet found courage to explain to Miss Elizabeth how this had occurred. On that particular evening he happened to be passing the door of the theatre in his brougham, which was as well known in Woolchester as the town-clock, and, not having been inside a play-house since he was a boy, he was seized with a sudden fancy to see the new comedy, "Fetters," which was announced in red letters several feet high on every wall and boarding in the town.

Perhaps the recollection that his old quiet evenings at home, when he could shut himself up with a cigar and a magazine, were now at an end had something to do with his decision, and he shrank from dressing for dinner and "making talk"—no easy task—for his aunt and Gertrude, as he had done every night for the past six months. At any rate he pulled the check-string, and told the grave servant that he had a call to make in that neighborhood, and would walk home, charging Thomas also to say that Miss Yorke need not "wait dinner." Thomas touched his hat—how he would have stared if he had known the call his master intended to make!—the carriage drove off, and Dr. Yorke, running up the dimly-lighted steps, bought his ticket and passed into the boxes, evening dress not being *de rigueur* in the Theatre Royal, Woolchester. And after all he did not see the comedy!

The curtain had just fallen on the first act, and as he sat reading his bill, and the characters of the play, a hand touched him on the shoulder, and an official of the theatre said hurriedly—

"You are a physican, sir? Will you please to come behind? Miss Carew has had an accident—hurt her foot. This way, sir."

Through the sacred and dingy door that led from the boxes to the stage, and was an object of interest to many of the young officers who had a taste for the drama, Dr. Yorke followed his conductor, and after stumbling against one of the "wings," and nearly backing into a green gauze lake on the banks of which Lady South Kensington's *fete* was about to be held in the next act, he found himself in Miss Carew's dressing-room—a bare little chamber with whitewashed walls, much scrawled with the names of former occupants—and in presence of the actress herself, who was lying on an improvised couch in her stage costume of often-washed white muslin, and her stage paint. Several ladies of the company were with her, and these kind people surrounded the Doctor and explained, in somewhat loud tones, how the accident had occurred.

"Only let me get through my part," Miss Carew said, her young face distorted with pain. "Can you bind up my foot so that I can stand on it?" she raised her eyes wistfully to the Doctor's, and two great tears rolled down the pretty rouged cheeks.

Dr. Yorke's grave face softened. He stooped down and spoke a few soothing words, but forbade the young lady's attempting any exertion.

Yes; he remembered it all, as he trudged along on that wild March evening—how he brought a carriage, and himself lifted the actress into it; how he called next day at her quiet lodgings, where he found that she had a little delicate brother, to whom he could be of great service; how he had since then learnt to look forward with a quickening pulse to the hour of his daily visit to Miss Carew, and had more than once found himself going out of his way during his round of calls, so as to pass by her door and glance up at the window of her room.

And now she had written him a little note—in a refined picturesque hand too—signed "Yours very truly, Olive Carew," and had asked him to come and see her for a few minutes. He turned down a side-street where trees grew behind the houses, just visible in the blurred lamplight, and paused with a beating heart at a certain iron gate. Some one was playing the piano in the room with the lit-up windows, and he stood with his hand on the lock to listen. It was pleasant, vague, rambling music—snatches of melody running one into the other, full chorus, lingering *legato* passages, a rain of sudden silver notes in the treble. The Doctor sighed as he knocked at the door.

"Miss Carew expects me," he told the woman of the house; and then he went up-stairs unannounced, and his heart was beating faster than ever.

The actress's sitting-room was shabby enough; the furniture was scanty and faded; but the low cottage-piano—at which young Nelson Carew was strumming as usual, his eyes full of dreams—a bunch of violets in a cheap blue jar, some books and photographs which were scattered about the table, gave it an air of comfort such as Dr. Yorke did not find in his own big substantially-furnished drawing-room at home.

Miss Carew was a tall slender girl, delicately pale, and with golden-brown hair and eyes and lashes, who reminded one of some white long-stemmed flower. Her hands were of exquisite shape and color, while the delicate curves of her figure were graceful even in the shabby black gown the actress wore, as she sat by the fire, intent upon the part in her hand.

Dr. Yorke was loath to break up the pretty picture, but, Nelson's extemporised transcription coming to an end, the lad woke up out of a dream, and saw him stand in the doorway, hat in hand.

"Dr. Yorke!" he cried, with a feeble shout of delight; and Miss Carew, turning, dropped her "part," and with a charming smile held out her hand.

"How good of you to come on this wet night," she said. "Take this chair by the fire. Nelson, don't choke the Doctor, you young bear!"

Nelson was hugging his friend in the firm conviction that it was an agreeable process to both of them.

"Olive has a piece of news for you," he whispered, "and she is dying to tell it!"

"Then we won't deprive her of that pleasure, will we?" the Doctor answered good-naturedly. "So be off to your music-box, sir—do you hear?"

"That last bottle of stuff is horrid," observed Nelson calmly, his arm still round his friend's broad shoulder. "Olive says it is wine, but, if so, why does she give me sugar after it, I should like to know?"

Dr. Yorke responded by propounding an alarming arithmetical problem which posed Nelson, and in an instant the boy limped back to his instrument, leaving his sister to her interview undisturbed. A silence ensued, which the Doctor did not seem inclined to break. He leant back in his chair, watching the firelight play on Olive's beautiful hair; and so it was the lady who spoke first.

"I asked you to come," she began gently, "because I could not leave without saying good-bye, and Nelson and I are going away to-morrow."

"Miss Carew!"

"It is sudden, is it not? But you know it almost as soon as myself. I have had an offer of an engagement in Birmingham, and I am compelled to go at once. Our manager here has been very kind, and has consented to release me at some inconvenience to himself."

Dr. Yorke could not speak. He hardly heard what the girl was saying, but with a curious tortured attention he was following every note that Nelson played. He, too—that prosaic country doctor—had been wandering in just such an unreal garden, hand-in-hand with his first love, as the music told of.

"It is you I have to thank for being able to travel," Miss Carew continued, in her sincere voice. "And Nelson, too! What can I ever say, Dr. Yorke, that will tell you how I feel your goodness to my poor boy?"

Still Robert Yorke did not speak. He was trying to recall his life as it had been before that happy night a month ago—trying to imagine how he could go back to that old life again, lonelier than ever as it would be for the fair glimpse of a fuller and happier existence which the past few weeks had shown him. Olive Carew was going away!

"And—Dr. Yorke——" The young lady hesitated now. She had her poor little purse ready in her hand, but how could she find courage to speak to that big, strong man, who was gazing at her with his heart in his eyes, and ask him to take payment for such generous service as he had done her?

"Must you go?" Robert Yorke said, at last, breaking through the spell of silence in which Nelson's music had bound him. "You are hardly fit to travel yet."

"I must. You know I have told you what a poor little pair of church-mice Nelson and I are. Some day he is going to make a great deal of money with his gift for music. But, while he is growing tall and strong, it is my delight to work for him; and in this new engagement I shall earn twenty-one shillings a week more than I earn now—think of that!"

Twenty-one shillings! Gertrude Fisher spent as much every week in sugar plums or Berlin wool; but to this pale, pretty girl, battling unaided with the world, the additional guinea meant additional comfort and ease for the boy whose feeble life was fading away slowly from a love such as is given to a few in this world—a sacred agony of affection, keen, intense, undying.

"Poor child!" burst with an irresistible impulse from the Doctor's lips; and Olive, looking up with grateful eyes, saw that his were dim.

A throng of pleasant recollections were gathering in the shabby room, as if to show him more clearly than ever how gray and dull his life must henceforth be—recollections of bright morning hours, when Olive, free from rehearsal, had sat and talked to him in that little bow-window against which the rain and wind were beating now, and when he had been permitted to "hear her" her part, bungling a good deal over the "cues," and rather posed by her matter-of-fact gabble of the lines which she would deliver with such charming point at night—of certain cups of afternoon tea poured out and brought to him by Olive—of one happy little supper of cold mutton, to which he had been permitted to contribute a bottle of Moselle, and over which they three had sat till twelve o'clock, the merriest, most talkative, least sensible party in Woolchester. These were ended now, and

"Over all old things, and all things dear."

But there was still his profession, Robert Yorke reminded himself—his profession and the big drawing-room in George street, enlivened by Gertrude's pieces and Miss Elizabeth's conversation.

As for this actress—this girl with her beauty and her frank, charming ways—she would go into the world where he might not follow. Her place was not in this small town, where fate had thrown her for a while. She would go away and forget him, and other men would learn to look at her with longing eyes and impatient, restless hearts, and —— Dr. Yorke made a sudden desperate resolve. Olive was looking absently into the fire, and seemed to have forgotten his presence. One thought of Miss Elizabeth's cold face crossed his mind swiftly, but he leaned forward—he was sitting close to Miss Carew on the narrow hearth, while Nelson was thumping out the Wedding March with all his little might—and took her slender hand.

"Olive, do not go—do not leave me—stay with me always!" he whispered, in broken sentences. "Give me the right to take care of you and the boy—be my wife."—[To be continued.]

CITY CATS.

An Automatic, Self-setting, Inflexible Exterminator.

IN all great metropolitan cities the cat question is assuming great proportions. Obedient to the primeval law to increase and multiply, cats have increased and multiplied, declared dividends and paid compound interest on the original investment—never a one going into bankruptcy. For a cat to have great-great-great-great-great grand kittens, is no strange thing if we believe the naturalists; and the tendency of the average to multiplication in ordinary only ceases when the last of its nine lives has flickered and gone out before an unusually well-aimed brick or inordinately spry bulldog.

The effect of cats upon manufactures has been very marked. Since New York was invaded by an epidemic of cats in 1855 it is computed that 213,000,000 boot-jacks have been sold, while the yearly consumption of soap-dishes and bed-slats amounted to $1,105,000 annually. Before the epidemic began and cats were but sporadic, boot-jack-maker after boot-jack-maker went into bankruptcy, and slat and crockery men did less business than dealers in fiddle-strings.

Last April letters patent were issued to one J. Tomlinson Hathaway, of Elizabeth, N. J., for the "Automatic, Inflexible, Self-Setting Exterminator"—a machine which was adapted to fill a want long felt in every family, and at the same time ruin the business of the chinaware and boot-jack dealers. It was a combination of steel springs, barbed hooks, syringes, high-pressure air receivors and clock-work, constructed in the form of a diminutive cat, and covered with the skin of one of those mathematical but obnoxious animals. Underneath the supposititious stomach was a clamp, so arranged that the "Inflexible" could be screwed on top of a fence and look as naturally as a living cat. When properly wound up, it was fit to run for twenty-four hours. Every five minutes during the silent watches a portion of the compressed air was let out in a growl or challenge which would not fail to arouse the ire and attention of any cat within earshot. At the same time a small Rhumkorf coil within sent a current of electricity through small Gassiot tubes in the eyes, making them gleam with greenish and bellicose fire. This, together with the small size of the couchant Inflexible, was generally sufficient to draw the wandering felines of the neighborhood to the scene. Now, when one of them approached sufficiently near to touch a small steel wire which projected

from the Inflexible, the defiant yowl was repeated and two small sprays of diluted vitriol were spit out at the cat—calculated to arouse the deepest indignation the turbulent breast of a cat is capable of. At the same time the counterfeit tail would swell up and wave to and fro, aggressively. The natural result was a closing in of the now excited cat upon the Inflexible, touching a hair trigger and releasing the machinery. The barbed claws now clutched the victim, the vitriol squirted, there was a wriggle, a yell and three yaups, and all was over. Then there was a faint click, the Inflexible's claws relaxed, the victim dropped to the ground, and all was ready for another cat.

The invention is a perfect success. Although only a month has elapsed since its introduction, the boot-jack market is completely broken, while crockery and bed-slat speculators are selling short. Edison has examined the instrument and pronounces it a thorough success. We understand that an agency for the Inflexible is soon to be established in this city.—*New Orleans Times.*

A CURE FOR RHEUMATISM.

The Remarkable Properties of Celery in this Malady.

NUMEROUS cures of rheumatism by the use of celery have recently been announced in English papers; but the following, more in detail, is given on the authority of the New York Times: "New discoveries—or what claim to be discoveries—of the healing virtues of plants are continually making. 'One of the latest is that celery is a cure for rheumatism;' indeed, it is asserted that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is always put on the table raw prevents its therapeutic powers from becoming known. The celery should be cut into bits, boiled in water until soft, and the water drank by the patient. Put new milk, with a little flour and nutmeg, into a sauce pan with the boiled celery, serve it warm with pieces of toast, eat it with potatoes, and the painful ailment will soon yield. Such is the declaration of a physician who has again and again tried the experiment, and with uniform success. He adds that cold and damp never produce, but develop the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism nor gout. English statistics show that in one year (1876) 2,640 persons died of rheumatism, and every case, it is claimed, might have been cured or prevented by adoption of the remedy mentioned. At least two-thirds of the cases named heart disease, are ascribed to rheumatism and its agonizing ally, gout. Small-pox, so much dreaded, is not half so destructive as rheumatism, which, it is maintained by many physicians, can be prevented by obeying nature's laws in diet. But if you have incurred it, boiled celery is pronounced unhesitatingly to be a specific.'"

PINS THAT PRESERVED A MAN'S REASON.—In the show window of one of the leading jewelers of Vienna is exposed to view a brooch, magnificently studded with gems, in the middle of whose chasing is inclosed the most singular of centers—four common, old, bent and corroded pins. This brooch is the property of the Countess Lavetskofsky. The pins have a history, of course. Seven years ago Count Robert Lavetskofsky was arrested at Warsaw for an alleged insult to the Russian Government. The real author of the insult, which consisted of some careless words spoken at a social gathering, was his wife. He accepted the accusation, however, and was sent to prison. In one of the lightless dungeons in which the Czar is so fond of confining his Polish subjects the unfortunate martyr for his wife's loose tongue spent six years. He had only one amusement. After he had been searched and thrown into a cell he had found in his coat four pins. These he pulled out and threw on the floor; then in the darkness he hunted for them. Having found them, perhaps after hours and even days, he scattered them again. And so the game went on for six weary years. "But for them," he writes in his memoirs, "I would have gone mad. They provided me with a purpose. So long as I had them to search for I had something to do. When the decree for my liberation as an exile was brought to me the jailor found me on my knees hunting for one which had escaped me for two days. They saved my wife's husband from luuacy. My wife, therefore, could not desire a prouder ornament."

WASHINGTON IRVING AND EUGENIE.—The gossip about the Napoleons set adrift by the tragic occurrence in South Africa brings up a letter from Washington Irving to his niece. He was in Europe in 1853, and the Emperor had just been married. "Louis Napoleon and Eugenie Montijo, Emperor and Empress of the French! one of whom I have had a guest at my cottage on the Hudson; the other of whom, when a child, I have had on my knees at Grenada. It seems to cap the climax of the strange dramas of which Paris has been the theater during my lifetime. I have repeatedly thought that each *coup de theatre* would be the last that would occur in my time, but each has been succeeded by another equally striking. The last I saw of Eugenie Montijo she was one of the reigning belles of Madrid. * * * Am I to live to see the catastrophe of her career, and the end of this suddenly conjured-up empire, which seems to be of such stuff as dreams are made of? * * * I consider it as liable to extravagant vicissitudes as one of Dumas' novels." He did not live to see the catastrophe, but it came.

BOOKS RECEIVED.

Tennyson's—The Lover's Tale: BOSTON: Houghton, Osgood & Co.

THE circumstances connected with the publication of this poem give it an interest apart from its attractions as a literary production. When the poet laureate was a youth of nineteen, two parts of The Lover's Tale were printed, and, feeling, as he says, "the imperfection of the poem, I withdrew it from the press. One of my friends distributed some copies of these two parts without my knowledge, without the omissions and amendments I had in contemplation, and marred by many misprints of the compositor. Seeing that these two parts have of late been mercilessly pirated, and that what I had deemed scarce worthy to live is not allowed to die, may I not be pardoned if I suffer the whole poem at last to come into the light accompanied with a reprint of the sequel—a work of my mature life—'The Golden Supper?'" Those who have read this last (as who that has a copy of Tennyson has not?) will not regret the "piracy" which impelled the poet to publish the poem complete.

How to Train in Archery; being a complete study of the York Round, comprising an exhaustive manual of long-range bow shooting for the use of those archers who wish to become contestants at the Grand National Association meetings. By Maurice Thompson, author of The Witchery of Archery. New York: E. L. Horseman.

The general theory and practice of archery is not treated of in this work, nor is the hunting of game with bow and arrows touched on. The book is designed for the advanced bowman and bowwoman who, feeling their power, are making ready for the highest achievments in the most difficult field of archery, the York Round and the Columbia and National Rounds.

Little Pitchers. By SOPHIE MAY. Illustrated. Boston: Lee & Shepard. Price 75c.

The name of this author is the sure guarantee of an entertaining book for the little folks, and we venture the prediction that Pollio and Posy (the hero and heroine) will gain a host of friends and admirers among the children. The pictures—of which there are a half-dozen or so—very prettily illustrate the text.

Hetty's Boarder. Boston: Loring & Co. Price 50c.

A bright little story, which will serve admirably for piazza, hammock, railway or steamboat service.

THE CENTURY.—This new claimant for public favor is proving itself to be one of the most attractive of weekly publications. The articles are extracted from foreign sources, and a wise discrimination and an appreciative sense of what will be likely to interest American readers, is displayed in the selections given. The following table of contents taken from issue of July 12 will give a fair idea of the work The Century is doing: The Literature of the Assyrians and Babylonians; Men of the Times, The Editor of Punch; The Lover's Tale; Victor Hugo's Political Career; A Moral in Lemons; A Buried Lake Village; The Vicissitudes of Authors; An English Opinion of the Rev. Joseph Cook; The Impressions of Theophrates Such, IV., a man surprised at His Originality; The Heir of the Bonapartists; A Utopian Experiment, The Jesuit Settlements in Paraguay; An Egyptian Watering-Place; A British Flunkey and the King of Italy; America Abroad; Lieut. Wheler's Survey Work in Oregon; A Ballad of Babylon; Stray Notes.

MAGAZINES.

CONTENTS OF THE JULY NUMBER OF ECLECTIC.—On the Study of Natural History. By Professor St. George Mivart; A Speech at Eton. By Matthew Arnold; The History of Games. By Edward B. Tylor, LL.D.; John Brown. A True Story; Sydney Dobell.—A Personal Sketch. By Robert Buchanan; On Chinese Fans. By Herbert A. Giles; Mr. Browning's Dramatic Idylls. By Mrs. Sutherland Orr; A Problem in Human Evolution. By Professor Grant Allen; Mademoiselle de Mersac. Chaps. X., XI. and XII.; Spring's Gifts. By Alexander H. Japp; Two Impostors of the Eighteenth Century; Peter the Great; Literature and Medicine; Flowers and their Unbidden Guests: The Melancholy of the Educated English; A Coquette; General Albert J. Myer. By the Editor; Literary Notices; Foreign Literary Notes; Science and Art.

COST OF ROYALTY.—The difference in the salaries paid to kings and royalty and those paid to the servants of the people in our Republic is striking. The Czar of Russia gets $8,250,000 per year, or $25,000 a day. The Sultan of Turkey gets annually $6,000,000, or $18,000 a day. Napoleon III. had a salary of $5,000,000 annually, or $14,000 a day. Francis Joseph of Austria receives $4,000,000 a year, or $11,000 a day. King William of Prussia is paid $3,000,000 a year, and Victor Emanuel $2,100,000, and good Queen Victoria manages to live on $2,200,000. Now, in addition to these salaries, each sovereign is furnished with a dozen or more first-class residences free of cost.

ANECDOTE OF BISMARCK.—Prince Bismark is always spoken of as a great statesman. But he has other remarkable characteristics, some of which are mentioned in his biography by Dr. Bush. His knowledge of cookery is said to be prodigious. He can discourse on all the known varieties of fish; he has original views about the frying of oysters; he has a wonderful comprehension of the different shades of cheese; and he can talk by the hour on the relative qualities of wines. During the war the French were roundly told that if they wanted to get a pleasant treaty of peace they must give him good dinners, and he threatened to chastise Baron Rothschild's steward at Ferrieres for refusing to provide the King with some of the many thousand bottles of wine which were locked up in the cellar. He once telegraphed to Germany for a fresh supply of gin. Happily, the strength of the great theological statesman's head is as remarkable as his theoretical acquaintance with the mysteries of vintages and malt. "He has beaten topers in beer-houses" with a completeness in which he has taken a just pride a quarter of a century afterward, and "he can challenge assembled humanity" to outdo him in the art of remaining perfectly sober under difficult conditions.—*Eclectic for July.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

ONE IN A THOUSAND.

"SHE'S one in a thousand,"
Said old farmer Grey,
As he waded knee-deep
In the sweet-scented hay,
"You won't find her like, marm,
From here to the town—
That woman out there
In the calico gown.

"If you could have seen her
That morning in May,
When I stopped at her father's
And took her away—
A likely young bride, marm,
So blooming and fair,
And 'clipper' as that little lamb
Frisking there!

"When first we were married,
And all for my sake,"
(And here the old farmer
Leaned hard on his rake,)
"She gave up her music
And gave up her books—
No nonsense about her
You know by her looks!"

"And if you should lose her?"
I ventured to say.
The old farmer sighed,
And looked down at his hay.
"'Twould nigh break my heart!"
He replied with a tear;
"As now help's uncommonly
High about here!"

SWEEPING.

SWEEPING, though a common practice, should not be done according to the rule laid down for all great achievements in life—do not "begin at the bottom of the ladder" (or the stair, as the case may be,) for ascension to the highest part of your dwelling. Begin at the top of the "topmost" room, and, with hair and hands protected, sweep the walls well, destroying the "skilful" spider, who toils and spins that you may find no leisure for idling. Having closed all doors of wardrobes, closets and connecting rooms, dampened the broom, sprinkled the floor (if carpeted, with damp meal, otherwise, with water), sweep the dirt into the hall, closing the door behind you. When each room has been treated, sweep the hall and stairway, each room below, and lastly, the hall below, taking the dirt out the back door on to a dustpan, or box set with one side beneath the projection of porch, or last step. By this time the dust will have settled above, and you may go to work vigorously with a duster made of the soft feathers of a turkey, sewed with stout thread around a handle with a notch in it for holding an occasional wrap of the thread. The inside of each feather should be out, in constructing a duster, causing it to resemble an expanding convolvulus, or petunia, with green morocco calyx for concealing the pen-ends and stitches. The broken handle of a parasol is a good foundation to work upon, and is usually furnished with "hook or crook" for hanging it up. If not, tie a red tape around one of the delicate grooves. When done sweeping and dusting, wipe up spots upon the floor or carpet, and leave the rooms to air.

Making Coffee,

is too frequently done "by chance." Pick, rinse, and put to bake (if you have no *toaster*) in an oven or pan, with a close lid. When dry, add a small lump of butter to insure uniformity of color in browning, and as it gets brown on top, remove the lid and stir thoroughly, level and replace the lid, till all is of a light-brown and will break by *very hard* pressure of the finger and thumb; take from the fire, leaving the lid on (the whole secret of *good* coffee lies in retaining the aroma, so easily freed by parching and boiling) till cool enough to add egg without cooking. (In winter when eggs are scarce and butter loses its gilt, I put the yelks in the butter and the whites in the coffee). Stir the coffee till all the berries or grains are glazed and dry, put into a close box or canister. For breakfast, grind the coffee at night, allowing a tablespoonful of ground coffee to each cup of water to be added, put into a clean, sweet pot, and pour over it one cup of boiling water, stop the spout, and set in a cool place. In the morning fill up with boiling water from the grounds of the previous day. For this purpose keep two coffee pots, and use them thus alternately, scouring with ashes after boiling the grounds, scalding and airing.

MRS. M. L. S.

MEN AS FINANCIERS.

IT is a well-known fact that when a business man fails, in nine cases out of ten, it is through the extravagance of his wife, his daughter, or some other relative or friend of the female persuasion. Such "necessities" as tobacco, liquor, fast horses and "the club," which he requires to make life comfortable have, of course, no depressing effect on his finances. Personally he abhors debt—has worked like a galley-slave to support a woman spendthrift, but finally has had to succumb to an unusual pressure in the money market, and he finds himself in middle life stranded on the reef of poverty. It is a pathetic picture, or rather would be if it were true.

There is still another fact which masculine writers have striven to impress on the public, and that is, the unfitness of the mind feminine to grapple with problems of finance. Woman may become absolute mistress of any of the arts, but when it comes to mathematics and science she is a failure; so say the gentlemen oracles. Now, I don't pretend to dispute this; but what I can't understand is, why it is that men who, as a set, never contract debts for themselves, and who have, moreover, a monopoly of the faculty for managing financial matters, should succeed in plunging every city, county and state in the land in debt. The men have all to say about appropriations, taxation, etc.; no woman ignorant of money affairs and with spendthrift proclivities, is permitted a voice in town, state or national council. Strange, most strange, that with men and men only at the helm, there should be such a report as the following: The municipal debt of 130 cities, representing a population of only 8,575,249, is $644,378,663. The percentage of increase in debt in six years being 200 per cent.; in taxation 83 per cent.; in valuation 75 per cent., and in population only 38 per cent.

In New York, Massachusetts, Illinois, Ohio, Wisconsin, Minnesota, Kansas, Missouri, Connecticut, Georgia, and Rhode Island, the total aggregate of local debt is $546,285,528. The total local debt of the country, at the end of 1878, was $1,051,106,112, exclusive of State debts.

It strikes me that female arithmetic of the most irresponsible sort could hardly do worse than that. Cities, counties and townships owing more than a billion of dollars, besides which there are state debts and the national debt!

Men may be superior financiers, but I'd hate to have one of them (mis)manage my money. I should expect to be bankrupt in about three months.

LINDA BROWN.

A CRUEL AND INFAMOUS LAW.

WHILE Massachusetts has gone forward, and not only by its last Legislature secured for married women the right to their own wearing apparel, but also the right for all women to vote for members of the school committee, Ohio has gone backward and re-enacted an old law which enabled a father to will away his child, born or to be born. The Delaware Signal publishes the text of the law, and comments as follows:—

The Ohio Legislature, at its session last winter, adopted a codification of various laws, and among them the statute in relation to Guardians of Minors, the 13th section of which is in these words:

"Any father, or in case the father be dead, or have gone to parts unknown, any mother may, by last will in writing, appoint a guardian or guardians for any of his or her children, whether born at the time of making the will, or afterward, to continue during the minority of the child, or for a less time."

This is a re-enactment of the old law, and probably the members of the Legislature did not take the trouble to read it before they voted for it. Seven years ago, when the law was the same, in a letter to Mrs. R. A. S. Janney, from G. T. Stewart, on the laws of Ohio as to married women, published in the Columbus Gazette, he thus denounced this and other laws which deprive the mother of her natural right to the care and society of her children:

"But there is a legal wrong more disgraceful to our manhood and more cruel to her womanhood than any other. It is that old relic of the dark ages which robs the mother of her children, and gives the legal custody of even the young infant to the father. The interventions of our courts have done something at times to relieve the atrocities of this law; but it is only a faint relief against a foul enormity. I will not defame the beasts of the field and of the forests by saying this is a brutal law; for the whole brute creation concede to the mother her natural right to the society, care and custody of her offspring.

It is the peculiar infamy of man that, by the iron force of laws made by himself, he does a deed of cruelty that shocks and shames all nature. He does what even the tiger and hyena would not dare to do—what they would loathe to do. He treads down the laws of God and crushes the heart of humanity in its divinest of rights, in its most sacred of duties. There is no relation on earth so near to heaven as that of the mother and her child. A heavy retribution will fall on any people that permits this holiest of human relations to be outraged. Often this rule of law becomes an instrument of the most fiendish tyranny and torture in the hand of wicked husbands; and many a poor wife suffers even unto death the most cruel abuse rather than be torn from her children. But she suffers and dies in silence.

"If the public purse is pinched a little, there is a cry in the markets, and all the people know it. Yet myriads of hearts are bleeding and breaking in the secret places of domestic life, and the world heeds nothing of them until it hears their funeral bells. In my practice as a lawyer I have found cases which aroused my pity for the poor victims of this tyranny, and my indignation at the law that sustains it; and I have seen how difficult it is to obtain relief against it in the courts. The law is utterly indefensible on any ground of argument, and if its converse as a supposition had been the prevailing rule, and this was proposed as a new principle of legislation, it would be universally scouted with horror and disgust. But it is one of those barbaric wrongs which have come down to us white with the frosts of ages, and red with the blood of hearts, and it requires a strong moral power to remove it."

The State of Kansas has set a noble example in this reform, for it has placed in its Constitution a provision which guarantees to mothers there the right by law to the custody of their children. It seems as if the young States of the West are the pioneers in civilizing our laws, as well as our territories. Let Ohio take its place in the front, and not in the rear of the grand movement which is sweeping over the world for the emancipation of Woman.

EDITORIAL ANNOUNCEMENT.

IN response to many requests, I will give illustrations of summer styles for ladies' dresses and hats, in RURAL of July 26.

F. R.

A GENERATION that will listen to "Pinafore" for three hundred nights and will read M. Zola's seventeenth romance, can no more read Homer than it could read a cuneiform inscription. It will read about Homer just as it will read about a cuneiform inscription and will crowd to see a few pots which probably came from the neighborhood of Troy.—*Frederick Harrison in the Fortnightly.*

WHAT OTHERS SAY.

(Continued from page 457.)

AMERICAN WONDER PEA AND DEFIANCE AND CHAMPLAIN WHEAT.—We find in the Sydney Morning Herald a full report of the Agricultural Society's Exhibition, from which we extract the following, as of special interest to RURAL readers: "Among those specially worthy of notice was the American Wonder Pea, shown for the first time. It is remarkable for the rapidity of its growth, as it is ordinarily ready for the table in thirty-three days from the time it is sown; and Mr. Dunnicliff has had three crops since September last." Our readers may remember that we tested this pea two years ago, when first sent out by Mr. Bliss, its introducer. We found it as early as the Little Gem, prolific, and of excellent quality.

In another part of the report, in the same journal, we find Mr. Pringle's Spring Wheats, Defiance and Champlain, spoken of: "Both wheats were sown by Mr. Dunnicliff, of Burrawang, in September and reaped in January, on comparatively poor soil. The Defiance yielded 57 bushels to the acre, and, with high cultivation, it is said that the yield in America has been as much as 128 bushels (!.—EDS. RURAL). From the other variety—the Champlain—the exhibitor obtained a yield of 45 bushels to the acre." A private letter from Burrawang informs us: "The new hybrid wheats, Defiance and Champlain, received a great many special visits, and were well spoken of by millers from other colonies as well as by our own. They received first and second prizes respectively for the best and most valuable new grains introduced into the colonies for the year."

THE VALUE OF POULTRY.—I. K. Felch tells the Scientific Farmer that of all the agricultural pursuits, none pays better than the labor bestowed upon the poultry on the farm. This fact is acknowledged, and yet how many of our farmers fail to make the same careful outlay for their poultry that they do for their cows and swine! They run the dairy with care, and the butter-box goes to market each week regularly. Why not have as a companion to it a poultry farm and an egg-box? The sour milk from the butter-making will pay far better fed to poultry than to hogs. Poultry sells at an average higher price than beef or pork, and it costs no more to make it. Our farmers in most cases near our cities have regular customers for their butter; these same parties would take weekly a much larger amount in money's worth of poultry and eggs. In this way 200 fowls upon a farm would pay as much into the family fund as would ten cows. Many of our farmers do not believe this; but let them try the experiment of keeping an exact account with both cows and hens, and they will find what we tell them is true. One bushel and a peck of corn, or its equivalent in other food, will keep a hen twelve months.

TO OVERCOME WEEDS.—The editor of the Rural Home, while traveling through portions of New York, makes some very entertaining notes from which we take the following: In the clover field were spots of *Anthemis arvensis*, a species of chamomile, which we judged were caused by the shocks of wheat which stood a long time last year, to dry out, and probably smothered the clover. This is a confirmation of our theory that the best way to overcome vile weeds is to manure and cultivate highly, seed thickly, and overcome the evil plants with good, and this is in accordance with the instructions of the Great Teacher, "Be not overcome of evil, but overcome evil with good," a precept as applicable to material as to spiritual things.

CURE FOR GAPES IN CHICKENS.—A correspondent of the London Agricultural Gazette, as an experiment, tried sulphur and salt, namely, two parts of sulphur and one part of salt mixed with water to the consistency of thick cream (it is best to use the finger in mixing, as sulphur will not readily mix with water). He then applied it with a feather from a fowl's wing, dipping it in the mixture and putting it down the chicken's throat about three inches, worked the feather up and down a few times, then applied some more in the same way again. He soon found they were much better, and repeated the operation three or four times, leaving two or three days between each application. They are now all cured and doing well.

TO RID SHEEP OF TICKS.—A cheap and effectual remedy for these pests is the following: Mix a little sulphur with salt and feed occasionally through the warm weather. It will effectually clear sheep of all ticks. I keep a few sheep and have not seen a tick on them in two years. The same remedy applied to cattle troubled with lice, will soon rid them of the vermin. So says C. Chamberlain in The Husbandman, and W. A. Ward says that the use of sulphur with salt well repays the trouble of keeping a supply for cattle and sheep. If a mixture of one part sulphur with seven of salt be freely supplied there will be no trouble with vermin. He gives his horses the mixture with good effect.

THE FUTURE OF JOURNALISM.—Mr. J. Whitelaw Reid, editor of the New York Tribune, says: "We shall not have cheaper newspapers. They are the cheapest thing sold now, considering the cost of making them. We shall not have bigger newspapers; they are bigger now than a busy people can read. We shall have better newspapers; the story better told; better brains employed in the telling; briefer papers; papers dealing with the more important of current matters in such style and with such fascination that they will command the widest interest. In making a newspaper, the heaviest item of expense used to be the white paper. Now it is the news. By and by, let us hope, it will be the brains."

LUCERN IN CANADA.—Mr. Romeo Stephens, of Slocum Lodge, St. Lambert's, near Montreal, tells the Farmer's Advocate that he commenced cutting his first crop of Lucern on Monday, the 2d day of June. Some of the crop was two feet five inches high, yet not a drop of rain had fallen on his farm this spring up to that time. Mr. S. cut four crops of this valuable fodder from the same ground during the season, and six cuttings are often taken from it in England.

AMMONIA FOR FLOWERS.—A lady correspondent of the Country Gentleman does well in reminding window flower growers of an old but nearly forgotten fact, that a few drops of hartshorn in the water given to plants is an excellent fertilizer. Mr. Meehan says that it is worth all other "concentrated" manures for this purpose.

SOME fear exists in England, as we learn from the London Garden, that the refrigerating process will be the means of inundating their markets with American peaches. A writer advises that they plant the "Early Alexander," so that the crop will ripen before the American harvest begins.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

IN SMALL THINGS.

ANNIE L. JACK.

"She has not been brought up to know very much about work, and it is very likely she will be extravagant." It was a vinegar-faced woman who made the remark of one younger and prettier than herself, who had just commenced housekeeping, and I thought to myself that although it was not likely to be true of the person under consideration, it is too often the case that when young girls enter upon the life of responsibility that housekeeping entails, they are, in nine cases out of ten, ill-prepared to conduct affairs with economy and regularity.

While the cooking schools do a good work, they only accomplish a part of the necessary education, and leave the student ignorant of many practical details. The art of housekeeping must become *fashionable* before it will be recognized as of importance and take its proper place in the world. The word is one I utterly despise as carried out by the women of the day, who have, in many cases, no independence, but must bow to all the ungainly and costly *fashions* that are invented to spend money and spoil the next generation. But if the sex would take in hand to study how to keep house, making the duties therein a part of education under a judicious mother, there would be less bankruptcy, fewer suicides and runaway bankers, and less misery and dishonor. "But it is not the sensible *home* girls that men choose as wives," says one over my shoulder. I fear *there* lies the trouble. The young men, with their extravagant and high-flown notions, must follow the butterflies who

> "Play with ivory keys,
> And dance the polka's measure."

And then they wonder why their wives are poor housekeepers, so unlike their mothers, who, reared in a slower age and different atmosphere, have been the household fairies of their lives so far. Ah! it is in small things that we must try to improve, never ignoring the lesser duties of our station in grasping at the higher; but with ceaseless, never-wearying touch giving attention to the ways of our household, and as the old song says, "Pay as you go and practice what you preach."

ICE AND ICE-WATER.

THERE is no doubt that many a life will be lost during the summer through imprudence in the use of ice. In this particular, the majority of persons are careless, notwithstanding the warnings of the past. Ice, if used cautiously, is not apt to do harm, but to the sick, it is generally a great comfort. All do not stop to think that to drink ice-water when one is warm from exercise is dangerous. The reason is obvious, when the high temperature of the stomach is compared with the icy fluid which is taken into it. Bits of ice may be taken with impunity, when ice-water would have serious effects.

As ice has at the present day come to be looked upon as a necessity in house-keeping, a refrigerator is in many families considered as important as a sewing machine. An elaborate refrigerator is a most convenient article to the housewife, but a plain one, that any carpenter can make, will answer. Those who have no ice-chest can keep a day's supply by wrapping the ice in flannel and placing it in a tub in the cellar. It is best to put a block of wood in the tub for the ice to rest upon. Otherwise it would not keep so long, on account of lying directly in the water from the melting ice.

M. G. R.

DOMESTIC RECIPES.

To Cook New Potatoes.

Wash, rub the skin off, and drop into salted, boiling water. When tender, drain, give a shake and set on the back of the stove to dry, with the cover a little at one side to allow of the escape of steam. Boil some milk; put in a large tablespoonful of butter and thicken with a little flour; wet smooth in milk. Take up the potatoes into a vegetable dish and pour over the gravy.

String Beans for Winter Use.

Wash, take off the strings and cut into pieces an inch in length. Put them into a stone jar, first a layer of beans, then a layer of salt, and so on, until the jar is full. Put a plate with a weight on top, and pour over cold water until covered. Keep in the cellar. When wanted for use, throw as many as are needed into a pail or pan of cold water, and let freshen for half a day. Change the water twice or thrice. Cook the same as if newly gathered. When packing, use plenty of salt.

E.M.

Molasses Cookies.

One teacup of New Orleans molasses, the same of white sugar, one-half cup of hot water, in which one tablespoonful of soda is dissolved, two-thirds of a cup of shortening (some prefer butter, but I use meat fat or lard), and one egg. Stir in as much flour as possible, then place upon the board and mix in just enough to have them roll out nicely—they must be quite soft. Roll them about one-fourth of an inch thick, and bake in a quick oven. Ginger, if liked.

Doze Cake.

Two cups of sugar, three-fourths of a cup of butter, cream, then add four beaten eggs, one cup of sweet milk, one teaspoonful of soda two cups of flour, two teaspoonfuls of cream-of-tartar. Dissolve the soda in the milk and stir the cream-of-tartar into the flour. Flavor as you wish.

Puff Cake.

Three eggs, three-fourths of a cup of butter, two cups of sugar; beat well together, then add one cup of sweet milk, two teaspoons of cream-of-tartar, one teaspoonful of soda and three teacups of flour. Put the soda in the milk, and the cream-of-tartar in the flour.

Palermo. M. C. W.

Brown Bread.

One quart of buttermilk, one-half teacupful of molasses, two teaspoonfuls of saleratus, one teaspoonful of salt. Stir in one-third cornmeal and two-thirds coarse flour, until stiffer than a batter, but not stiff enough to pile up. Steam two hours, then put into the oven long enough to brown.

Fried Cakes.

Two cups of sugar; two cups of buttermilk; three eggs; one-half cup of butter or fried meat fat; two teaspoonfuls of saleratus and any seasoning you like. Mix just hard enough to roll out.

Hard Soap.

Six pounds of soda; seven pounds of grease; three pounds of unslaked lime and four gallons of water. Put soda, lime and water into a kettle and boil until dissolved; let it stand two days, pour off the liquid, throw away the dregs, add the grease to the liquid and boil until it is of the thickness of honey. Then turn out into a wash-tub to harden, cut into whatever shape you like, dry and pack away for use. Any grease will answer if cleansed.

E. M. P.

Cold Slaw.

Slice or chop very fine one head (or enough for family use) of cabbage and season with salt and pepper. Beat three eggs well together; mix with it a teacupful of vinegar, one teaspoonful of unmixed mustard, a tablespoonful of sugar and a tablespoonful of butter. Bring to the boiling point and pour over the cabbage.

MARY B.

Cucumber Pickles.

Take fresh from the vines, wash carefully, put them into an earthware jar, pour salted boiling water over them for three or four mornings in succession and the last time drop a lump of alum into the water. Then turn off the water and pour over weak, hot vinegar and let stand overnight. In the morning drain and cover with hot spiced vinegar. Cover with horse-radish leaves and they will keep for a year.

Cream for Coffee.

The members of my family prefer the following made cream for their coffee to the genuine article. Beat one egg to a foam, add a tablespoonful of white sugar, and pour over a pint of boiling hot milk stirring briskly as it is poured over the egg. Prepare at night for the morning.

A NEW ENGLAND HOUSEKEEPER.

News of the Week.

MISCELLANEOUS.

Monday, July 14, 1879.

The export of dressed meat from this city to the English market, which reached a large proportion two years ago, but was temporarily suspended in consequence of the increasing shipments of live cattle, is about to be revived on an extended scale. The action recently taken by the British government to check the exportation of cattle from this country has produced its natural effect. Large dealers in cattle and beef have given up exporting live cattle and have again turned their attention to the export trade in dressed beef. A new system of refrigerating has been put into action whereby the necessity for the use of ice on board steamships is done away with. It has been found through numerous trials in the exportation of meats, that they must not be frozen, but only kept at a temperature which will delay decomposition. The new system is said to be a perfect and cooling process. It is produced by means of compressed air, which can, if necessary, be reduced in temperature even below zero. It is expected that the fresh meat trade to Great Britain can be revived to its former magnitude, and even exceed it. Such has been the speculative tendency in cotton that since last September eighteen million bales have been sold in New York alone, which is five times the actual crop. Information has been received here that, on the evening of the 4th, a terrific storm swept over Merrick county, Neb., entirely destroying the crops. The county is four miles wide and several miles long. All the wheat and corn within its limits was entirely destroyed. Jeff Davis has struck a bonanza. Mrs. Sarah A. Dorsey, of Mississippi, who died recently in New Orleans, bequeaths to him two large plantations in northern Mississippi and an elegant villa at Beauvoir on the sea coast. The bequest was made because of "the great services and sacrifices" of Davis "in behalf of the South."

Connecticut refuses to adopt the scheme of issuing State bonds to take up town and city bonds issued for railroad purposes. The proposal was for the towns and cities to give the State their bonds bearing 4.65 per cent. interest, while the State bonds should bear only four per cent. At a meeting to advance the scheme only one town favored it, and even a committee to consider it was refused. Such State indorsement would be only an opening wedge to the payment of the debt from the treasury of the commonwealth. A like proposition has been put forth in this State. Connecticut sets New York a good example in this respect. Seventeen western railroads report an increase of gross earnings during June amounting to $425,465, as compared with the same month last year, or fully ten per cent. The increase for the six months of the year is only $158,796 in excess of the earnings of the first half of 1878. Improving business is counted on for the rest of the year. Reports from various southern cotton exchanges show that the cotton crop June 30, was a week or two weeks behind last year. Crop reports from all parts of Canada indicate a fair average yield. The only black spot is the condition of spring wheat, which promises to be below the average. Wednesday afternoon over 500 Mormons arrived at Castle Garden, New York.

The "Arithmatic men" of both sections have begun their predictions in regard to the effect of the next census on the political strength of the South in Congress. The "Stalwart" reckoners rely chiefly on Kansas; the "Brigadiers" on Texas and Arkansas. When these examples are departed from the guessing is of the loosest. It may be that the "solid South" will become of small importance after the readjustment of the representation, though it will make no contemptible part of the Senate; but morally it will exist just so long as sectional dissensions growing out of the war are fostered by one party or the other. The editor of the Kansas Nationalist has reprinted in his paper a warning article, bearing date of Christmas, 1875, in which the danger to the country of a "political Macedonian phalanx" was pointed out, and an internal remedy proposed instead of the external so fruitlessly applied by Grant's Administration. He urged the systematic colonization of selected States in the South, with a view to introducing a fresh Northern or European population which would "nationalize them. He now, with greater force, renews his exhortations to this effect, and shows how easily Florida and Arkansas, for example, could be won over, not to Democracy or to Republicanism, but to sympathy and co-operation with the North on national questions, by an Emigrant Aid Society like that which rescued Kansas from being a slave State. He has perfectly sound ideas in regard to the mode of colonization—in masses, or by accretion where Northern settlements have already established themselves, and with no party distinctions or noisy porpagandism; and he certainly gives reasons for thinking that Eastern philanthropists who are contributing money to General Conway's exodus steamboat, would better employ their money in some such scheme as he advocates.

General William H. Sterling, Inspector of Cattle for the State of New Jersey, has placed Essex county under quarantine. There is no epidemic, but a few cases in South Orange, West Orange and Waverly have been reported. The quarantine is more preventive than remedial. No cattle can be removed from or into Essex county without his permit, nor can they be removed from one place to another inside the county limits. Under the law any transgression of the quarantine rules is punishable as a misdeamnor.

THE GOVERNOR'S ORDERS.

Governor McClellan recently sent to General Sterling the following orders:—

I have to request that you will use your best endeavors to impress upon the owners of cattle, whether infected or not, that these instructions and the law known as the Pleuro-Pneumonia law are in their interest, as well as that of the State in general, and that their hearty co-operation is asked and desired in carrying out the necessary measures.

It is my wish that while the provisions of the law are made most effective and its purposes promptly and fully accomplished, this should be done in such a manner as to cause the least possible inconvenience and injury to all concerned and a minimum of expenditures by the State.

In this spirit I further advert to certain precautions which are absolutely necessary to insure the complete and prompt eradication of the disease among cattle in the State; and which it may be difficult to enforce without the cheerful and intelligent assistance of the owners of cattle and of all good citizens.

Among them are the following:—

No persons who are not employed in the care of the cattle kept there should be allowed to enter infected premises.

No animal or even fowls should be allowed to enter such premises, for the reason that even when not liable to the infection themselves, they may carry its seeds to neat cattle.

The clothing of all persons engaged in the care, slaughter or rendering of diseased or exposed cattle or in any employment which brings them in contact with such diseased animals should be disinfected before they leave the premises where such animals are.

Persons employed in the care of infected animals should not enter stables, yards or premises where sound cattle are kept without first thoroughly disinfecting their clothing.

Manure, forage and litter upon infected premises should only be removed therefrom in such a manner and be so disposed of as to prevent the spread of infection.

You are instructed not only to take such measures as in your judgment will secure the observance of these and all similar necessary precautions, but you will also use every effort to convince those concerned that it is their own best interest to secure such observance by all means in their power.

Whenever in your judgment it becomes necessary, you are authorized, without further reference to me, to call upon the sheriffs and deputy sheriffs of the townships concerned to carry out and enforce the provisions of the law and of the instructions received from me.

On the 30th of last month the total amount of currency in circulation was $734,801,994.78, and worth its face in gold. The purchasing power of this circulating medium is greater by nearly $9,000,000 than our currency outstanding at any one time, ever before had. But, then, the population and business of the country are also larger than ever before.

Ex-Gov. Allen, of Ohio, humorously known as Olebillallen, died on the 10th inst., after a brief illness. Despite the reports that the Memphis municipal authorities had taken the most careful precautions against the recurrence of yellow fever in that city, it has once more broken out there. This is unusually early in the season. Even in New Orleans it seldom appears before the early part of August. A number of deaths have already occurred in Memphis, and there has been a stampede of fully 10,000 of the inhabitants. All the surrounding towns, and most of the cities that do business with the place, have already quarantined it. Owing to the utter stagnation in business matters that must result in case the Gulf cities are again scourged by the yellow pestilence, the news of the Memphis outbreak has already had a very injurious effect on business in many quarters outside the plague-haunted city. The news caused a severe break in the Chicago produce markets on Monday. Mess pork declined eighty-five cents per barrel, nearly nine per cent. Short ribs, the leading cuts of meat, declined sixty-five cents per 100 pounds, over thirteen and one-half per cent.; and lard also fell. The panic extended to breadstuffs, and although they did not decline so much as hog products, the break was a bad one for holders. Wheat fell two and one-half to three cents. The depression was the greater as the scourge had begun early in the season, and appeared unusually far north. The latest reports say that it is not spreading rapidly, and all the other Southern cities and towns are still reported to be entirely free from the scourge.

FOREIGN.

Prince Bismarck has carried his tariff scheme very nearly in the form in which he presented it. It comes into operation part on the 1st of October next and part on the first of January. Fifty per cent. extra duty is to be imposed on the goods of countries which treat German goods unfavorably, which of course, is simply an assertion of a claim to equality with the most favored nation. It is estimated that the new tariff will bring in an addition to the revenue of 120,000,000 marks, of which the Empire will get 22,000,000, the rest going to the separate States. There is not much likelihood, however, that the arrangements will stand very long. The tariff is too complicated and onerous to be administered without great vexation, and the duties on foreign grain and provisions are likely to increase discontent and disaffection in the great towns. The duties on grains and raw materials from this country will injure our trade considerably with the Fatherland.

In Paris a week ago, a magnificent banquet was given at the Grand Hotel to M. de Lesseps, in celebration of the signing of the transfer to him of all concessions for a water-way across the isthmus. General Turr presided. All the speakers were emphatic in declaring that the Panama project was in nature universal, and that it was not intended to give predominance to any particular national interest, but it was purely a commercial enterprise. M. de Lesseps does not think that the expenses of constructing the Darien canal will exceed 250,000,000 fr. He says the difficulties of the work are not so formidable as they were in the construction of the Suez canal, as a railway already exists along the course of the proposed Panama canal, with a large town at each extremity.

Advices from Kent, Eng., state that the hop crop threatens a more disastrous failure than for years past. The contributions to the vatican of Peter's pence for the first half of the present year have increased about $140,000, compared with the sum contributed during the same period in 1878. The United States consul at Messina sends the department an account of the recent eruption of Mount Etna. It broke out on the 26th of May and ceased the 11th of June. In Messina the pavements and balconies were covered with black dust. Villages near the mountain were shrouded with darkness. The inhabitants fled in terror. The damages are estimated at $200,000, towards which the Italian parliament has contributed a large amount. King Humbert gave personally $1,000. General Grant's trip, as now marked out, will be extended to Australia, thence to New Zealand, Samoa, the Fecje Kingdom and the Sandwich Islands, reaching California in April, 1880, instead of in September, 1879.

The news from Zululand shows that the prospect of peace is not nearly so assured as was supposed, and Cetewayo is again suspected of simply wishing to gain time by the late negotiations to get his crops in and destroy the grass on the line of the British advance. He is said, in the meantime, to be entrenched at Ulundi, in the north of his territory, in an impregnable position, but he is also said to believe that if he can get one chance at the British army in the open field he will finish it. In fact, it seems not unlikely that if battle is offered him on open ground he will accept it, and there is no doubt that defeat under these circumstances would crush him. The difficulty of reaching him, however, with existing means of transportation is enormous. Sir Bartle Frere, who brought on the war, and who is really responsible for all the disasters that have occurred, and who has been disapproved and removed by the home Government, appears to be not in the slightest degree abashed. He has been making a triumphal progress through the colony, delivering eulogies on his own policy and receiving the plaudits of the colonists, who rather like to have the English carrying on a great war for them and spending enormous sums among them.

The body of the Prince Imperial arrived in England from Zululand on Tuesday last, and was placed beside his father's at Chiselhurst on Saturday. Never has such great honor been shown to the remains of a foreigner by the British royalty, nobility and commonality. The Prince of Wales, and the Duke of Connaught, and a host of the highest nobility were present at the debarkation of the body. The Queen witnessed the funeral which was attended by the Prince and Princess of Wales, and several other members of the Royal family, including the Commander-in-Chief of the army, the Duke of Cambridge. Prince Jerome Napoleon, the present head of the Bonaparte family, his sons and most of the leading Bonapartist notables of France were present. Marshal McMahon solicited permission of the government to attend, but was refused, and an order issued that no officers of the army or civil employes of the government should be present. That the young man was slain in the service of the British crown, is a good reason why he should be honored by the British people. The sentiment is deepened by the knowledge that his death is greatly due to official mismanagement and soldierly cowardice, or, to say the least, culpable demoralization. Then, again, he was very popular among his companions at the military school at Woolwich, and was a great favorite with the royal family socially. Moreover, he was the hope of a great party in his own country, in capacity a good deal above the average of royalty, but, above all, he was the only son of his mother and she is a widow.

A Half or Whole Bottle of Murray & Lanman's Florida Water mixed with the water of the bath is of great use to invalids and all delicate or nervous persons, as it revives and braces up the failing strength and soothes the most irritable nervous system.

Why do Hop Bitters cure so much? Because they give good digestion, rich blood and healthy action of all the organs.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 12, 1879.

BEANS AND PEAS.—Marrow beans quiet and tending lower. Mediums not in heavy supply; quoted steady. Other sorts dull and in some cases flat. The West Indies seem to want less red kidneys than usual; it is rumored that consumers are obtaining supplies from other points. Peas without important change. Beans, marrow, prime, $1.30@1.32½; fair to good, $1.25@1.30; medium, prime, $1.30@1.32½; fair to good, $1.22½@1.27½; pea, choice, $1.30@1.32½; fair to good, $1.30@1.25; white kidney, choice, $1.32½@1.35; fair to good, $1.25@1.30; do., red, prime, $2.60@2.70; fair to good, $2.50@2.60; turtle soup, $2.25@2.30. Peas, green, per bush., $1.90; Southern B. E. per 2 bush. bag, $2.35@2.60; Canadian, in bulk and bond, per bush., 70c.

Exports for the week, 386 bbls. beans; receipts, 3,050 bush.

BEESWAX.—Demand is slack and prices unsettled; quoted at 24@24½c.

BROOM CORN.—Demand good and supplies steadily diminishing.

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Right through the week the absence of consumers has been marked in the demand, and though supplies are of more favorable bulk, prices continue easy. Besides exports are light, only 6,900 pkgs for week, and only about one-half of that quantity taken for England. The top for State is 15½c. for creams and 13½c. for tubs and fine pails. Firkins scarce, but not much wanted for Southern shipment. Falsely branding of poor butter, as creamery is not likely to prove a profitable deception; crops are too large and good, and buyers are now too sharp to bite at such flimsy bait. Summer butter had better be shipped right along, as that grade, if packed down, reduces the average price of dairies in the fall. Western butter is quiet, only fine marks show steady business.

State pails and half tubs, choice, 13½c.; good to prime, 12@13c.; fair to good, 10@12c.; firkins, choice yellow, 14½@15c.; fair to good, 13@14c.; Welsh tubs, choice, 13@13½c.; good to prime, 12@13c.; fair to good, 10@12c.; poor, 8@9c.; State creamery, best invoices, 15½c.; good to prime, 14@15c.; sweet cream, best, 15c.; fair to good, 13½@14c.; Western, best invoices, 15½c.; good to prime, 14½@15c.; fair to good, 13½@14½c.; imitation creamery, 10@12c.. Western dairy, best invoices, 10½@11c.; good to prime, 9½@10c.; fair to good, 8½@9½c.; poor to fair, 7½@8½c.; Western, factory, best invoices, 9½c.; good to prime, 8@9c.; fair to good, 7½@8c.; poor to fair, 7@7½c.; grease butter, 3½@4½c.

CHEESE.—Although the arrivals have been large they have been well bought up, the export demand having been brisk, and the market leaves off a trifle better, closing at 6@6¼c. for fancy factories.

Quotations are for fancy factory, 6@6¼c. for best; 5. 5¼c. for good; 4@5. for fair to good; 3@4c. for half-skimmed, and 1@2c. for skimmed; dairy at 5@6c. for good and fine; 3½@4 c. for fair to good, and 1@2½c. for skimmed; Western factory at 5@5½c. for fine; 3½@4½c. for half-skimmed, and 1@2¼c. for skimmed.

COTTON—Has been variable and excited, closing strong at 12.16c. for July; August, 12.18@12.19c.; September, 12.15@12.16c.; October, 11.26c.; November, 10.92@10.93c.; December, 10.88@10.90c. January, 10.83c.; February, 11.00@11.02c. March, 11.12@11.16c.

Quotations for spot cotton are based on American standard of classification, and cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	10¼	10⅜	10⅜
Strict ordinary	11⅜	11¼	11¼

Good ordinary	10 15-16
Strict good ordin'y	11 5-16
Low Middling	11⅛
Middling	11⅜

DRIED FRUITS.—Trade is still slack and prices generally unchanged.

Apples—Evaporated Alden's and Williams's at 10¾@11c.; do., new process, at 8½@9c.; State plums, 8@10c. Blackberries quoted at 4½@5c. Peaches—Peeled Georgia, 5@6c. for poor; 6@7c. for fair to good; 8@9c. for prime; choice North Carolina, 9@10c.; good do., 7½@8½c.; unpeeled halves, 3@3½c.; quarters, 3c. Apples—New, 2½@2¾c. for Southern quarters in bags; 2½@3½c. for sliced; State, 3@3½c. for new sliced, and 3@3½c. for quarters; Western, 2¾c. for new quarters.

EGGS.—Receipts for week, 5,525 bbls.; do., last week, 8,429 do. The tone of the market is better, but prices do not jump up with the usual vigor shown in summer when supplies fall off.

Near points, 14@15c.; State and Penn., 13½@14c.; Western, choice, 12½@13c.; Canadian, do., 13@13½c.; poor Western, 11½@12c.

FLOUR.—After a sharp advance based upon a rising wheat market, the market leaves off easy and dull.

Latest prices are: $3.65@4.10 for inferior to very choice superfine State (fancy held 5@10c. higher); $3.15@4.45 for poor to good extra do., odd lots and lines; $4.45@4.75 for good to choice do.; $3.65@4.10 for inferior to very choice superfine Indiana, Iowa, Michigan, &c. (fancy quoted as high as $4.10); $4 10@ for inferior to good shipping extra do., and $4.45@4.70 for good to choice extra do.; common to about choice white wheat extras, $4.50@5 10; choice to fancy do. at $5.10@5.35; red and amber winter wheat, inferior to very choice trade and family, at $4.35@5.45; round hoop Ohio at $4.35@4.75, and trade and family brands of do. at $4.95@5.60, the latter rate for fancy; St. Louis, $4.95@5.95 for inferior to good extra; $5.95@6.85 for good to very choice (with fancy brands held higher); Minnesota clear, inferior to fancy, at $4.30@5.45; Minnesota "straights," very inferior to strictly fancy, $5.00@6.50, and patent poor to strictly fancy at $5.45@8 00 (with a few fancy brands quoted at higher figures); unsound stock at from $2.25@5.25; city mill extra at $5.30@5.75, good to to very choice, for West Indies; do. for England, $4.20@4.60; do. trade and family extras, $5.75@6.75; do. for South America, $5.75 for standard brands (winter wheat product); No. 3 at $2.50@3.35 for poor to strictly fancy.

CORN MEAL.—Sales at $2.55@2.60 for Brandywine and $2.00@2.35 for Western.

FRESH FRUITS.—Demand good, especially for items that admit shipment to watering points and other cities. Some fancy Georgia peaches have sold at $7.50@9 ₱ bush.; do., N. C., $3@5; common N. C., $1@3; Md. and Del. crates are poor yet; quoted at $1@2. The sale of water-melons opens unusually early this season. Our currant crop has dwindled severely this season. Apples, red Astrachan, ₱ crate, $1@1.75; Howell, 75c.@$1; common green, $1.00@2.50 ₱ bbl. Pears, Southern Bell and Jargonello, $6.00 ₱ bbl; green Bartletts, bush. crate, $2.80@3; common, 75c.@$1.25 do. Cherries, prime table, 8@10c.; other, including sour, 3@7c. Cherry currants, per lb, 8@10c; small and black, 5@7c. Gooseberries, per bush., $1.75@2. Whortleberries, Md. & Del., per qt., 6@8c.; Jersey, per 14 qt. box, 75c.@$1.25. Blackberries, N. J. Wilson, 10@12c. ₱ qt.; Md. & Del., 7@10c.; Dorchester, 6@8c. Raspberries, Antwerp, per 3 to qt. cups, 3½@5½c.; do., native, 2@3c.; Blackcaps, per pint, 3@4c.; Brandywine, 5@6c. Watermelons, Geo., per 100, $30@40; Fla., $20@30. Hothouse grapes, B. Hamburgh and Muscat, 75c.; Sweet Water, 30@40c. Peanuts quiet but firm, without much late addition to the stock; Va. hand-picked, $1.40@1 45; fancy, $1.30@1.35; extra prime, $1 25@1.27½; good to prime, $1.15@1.20; shelled, 5½@5¾c.

FURS AND SKINS.—At the London July sales sea otter advanced 20 and opossum 10 per cent.; skunk declined 25, red fox, musquash and Eastern and Northern mink 15 and grey fox 30 per cent, as compared with sales last March. Western and pale mink, marten, cross and silver fox, beaver, bear, otter, fisher and raccoon unchanged.

GRAIN.—Wheat sold up sharply early in the week, on the poor crop prospects abroad, and an extensive business, but left off weak at a decline. Latest sales are of No. 1 white at $1.16@1.17; do. July, at $1.16½@1 17; do. August, at $1.12@1.13½; No. 3 white at $1.10; ungraded white at $1.13@1.17; No. 2 red at $1.18@1.20; do. July, option, at $1.15¾@1.17½; do. August, at $1.11@1.12½; do. September, at $1.10@1.12; do., new crop, deliverable last 10 days in August, at $1.12; ungraded red at $1.00@1.18; No. 1 amber at $1.20; No. 2 do. at $1.14@1.17; do., July option, at $1.13½; ungraded amber at $1.12@1.15; No. 2 Chicago and Milwaukee spring quoted at $1.11 bid and $1.15 asked No. 3 spring at $1; No. 4 spring at 95c.; ungraded spring at 91c.@$1.05; rejected spring at 83@85c; No. 2 red for September at $1.12 bid and $1.13 asked. Rye at 66c. for Canada and State, and 63½c. for Western. Corn has been active and higher, but closed weak; latest sales are of New York No. 1 at 46¼c.; New York No. 2 at 45@45¾c.; do. July at 45c.; do. August at 45¾@46c.; do. September at 47c.; New York steamer mixed at 44¾c.; do. July at 44¾c.; do., August, at 45c.; ungraded Western mixed at 42@45¼c.; No. 2 white at 50c.; New York yellow at 46@46½c.; steamer yellow at 45c. Oats have been active at higher prices, but closed weak: sales of New York No. 1 at 43@43½c.; New York No. 2 at 40½@41c; New York No. 3 at 39@39½c.; No. 1 at 40¼c.; No. 2 at 39¾@40¼c.; No. 3 at 38½@39¼c.; mixed Western at 38@40½c.; white do., at 40@43c.; white State at 42@44c.; No. 2 Chicago, afloat, quoted at 40@40½c., and 39c. in store.

HAY AND STRAW.—Trade is liberal and prices sustained.

Hay quoted at 45@50c. for shipping and 70@80c. for prime retail qualities. Straw at 50@55c. for long rye, 40@45c. for short rye, and oat at 30@40c.

HOPS.—Emmet Wells, in his circular, says: "Continued discouraging crop reports, both from Europe and from our own country, has caused a further advance of 2c. ₱ lb. choice on hops of the last growth and 1c. on "yearlings." The chief buyers are speculators and brewers. The market is not at all excited, but a very strong feeling prevails, and the tendency is toward a further advance. We hear of a few buyers offering to contract with growers at 15c. for the new crop—not a very liberal offer considering the fact that the opening price is likely to be nearer double that figure, judging from the present outlook.

	Bales.
Receipts for the week	2,085
Total receipts since September 1, 1878	77,774
Total receipts for same period in 1877	135,599
Export clearances for the week	168
Total exports since September 1, 1878	28,941
Total exports for same period in 1877	78,531

Quotations are for New York's new crop, choice, 10@15; New York's, new crop, medium, 8@9; New York's, new crop, low to fair, 6@7; Eastern, 7@10; Western, 7@10; Yearlings 3@5; Olds, all growths, 2@3 Pacific coast nominal 9@11

POULTRY AND GAME—Cooped stock has been very scarce, and prices for the moment are very strong. Liberal supplies expected next week.

Chickens, best, per lb., 20@22c.; small, 18@19c.. fowls, N. J., 13@13½c.; Western, 12@13c.; Southern 11½@12c.; roosters, old, 6@7c.; turkeys, 9@11c.; ducks, spring, ₱ pair, 62½@78½c.; N. J., N. Y., and Pa., per pair, 60@70c.; Western, co., 45@50c.; Southern, do., 40@45c.; Geese, Jersey do., $1.37@1.62.

Dressed poultry is in light demand for market use, small receipts however support following range:

Turkeys, Phila., dry-picked, 12@14c.; State and Western, prime, 11@12c.; chickens, Phila., large, ₱ lb, 27@35c.; Phila., small, 23@24c; State, 20@22.; Western, 18@20c.; fowls, N. J., choice, ₱ lb,, 13@14c. State and Western, dry-picked, 12@13c.; scalded, 10@12c.; Phila. dry-picked, 14@15c.; ducks, spring, Phila. dry-picked, 16@18c. ₱ lb.; spring, small, 13@15c.; old, Phila., dry-picked, 10@13c.

There is hardly game enough to quote. In summer almost all items find markets near at home. Eng. snipe and plover nominal at $2 2.25 ₱ doz.; stall-fed pigeons, $1.75; baited, $1.50; tame squab, $2.00.

PROVISIONS.—Towards the close of the week a panicy feeling prevailed, based upon speculative influences and assisted by the apprehended spread of the yellow fever, with its consequent effect upon trade with the South. Closing prices for mess pork are for July at $9.30 bid and $9.40 asked; August at $9.40 bid and $9.40 asked; September at $9.45 bid and $9.55 asked; October at $9.50 bid and $9.60 asked. Bacon at $5.25 for long clear and $5.40 for short clear. Beef—Plain mess at $10.25@10.50; extra mess at $11.50@12; packet at $11@11.50; tierced beef, city extra India mess, at $18@20.50. Beef hams at $20. Lard at $6.17½ for spot lots, $6.20 for July and August, $6.50@6.37½ for September, $6.32½@6.35 for October. Stearine at 7¾c. Tallow at 5 15-16@6c. for prime.

SEED.—Grass are dull; clover quoted at 6¾c. for prime and 6¾@7c. for choice. Timothy at $1.70@1.75.

TOBACCO.—There is a fair export demand and the market generally is a strong one, with quotations essentially unchanged.

VEGETABLES.—Potatoes have suddenly and largely declined, under very heavy supplies. L. I. exirs, $1.75; other, $1@1.50; Md., $1@2; culls, 5c. Norfolks no longer arrive. Garden truck easy in prices. Green corn, Hickensack, $1 ₱ 100. Burlington, 50@75c. Cucumbers, L. I., ₱ 100, 75c.; Norfolk, ₱ crate, 25@50c. Tomatoes, L. I., near-by, ₱ crate, $2; So. Jersey, ₱ basket, 75c.@$1; Norfolk, ₱ bush. crate, 50@75c. Beans, L. I., wax, ₱ bag, 75c.@$1; do., round, 75c; do., flat, 50c. Squash, L. I., yellow, ₱ bbl., $1.25@1.50; do., white, $1. do., Norf., marrow, $1.25@1.50. Green peas, L. I., per bag, 75c.@$1. Cabbage, Early Wakefield, per 100, $2@4; Flat Dutch, $5@6. Onions, Va. and Md., per bbl., $1@1.50. Beets, Jersey, per 100 bunches, $1.50@2. Russia turnips, per bbl., 75c.@$1; Jersey, new, per 100 bunches, $1@2. Carrots, per 100 bchs., $1@1.50. Cauliflower, ₱ bbl., $1.50@4.

There is hardly game enough to quote. In summer almost all items find markets near at home. Eng. snipe and plover nominal at $2 2.25 ₱ doz.; stall-fed pigeons, $1.75; baited, $1.50; tame squab, $2.00.

WOOL.—There has not been much activity the past week, and there has been rather more of a disposition to sell; XX Ohio fleeces quoted 40@41c.; No. 1 and above Ohio at 40@42c.; spring California, 19@25c.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 12.

BEEVES.—Receipts for the week, 12,378 head. A large portion of the heavy receipts arrived late in the week, and the market closed fully ½c. off compared with Wednesday. Texans sold at 7@7¼c.; common to extra steers, 55@56 lbs., dress, 8@9¼c.; tops and extras, 10c.

MILCH COWS.—A number were held over; nominal range, $30@55 per head.

VEAL CALVES.—Market low and not well attended. Grassers and buttermilk, 2@3c.; ordinary to good milk veals, 4@5¼c.; extras, 6c., including State and N. J.

SHEEP AND LAMBS.—Total for week, 32,877 head. Supply in excess of the demand, many carried over. Poor to fair sheep slow at 3½@4¼c. Extra shipping, Ohio fat, brought $5.30 per 100. Altogether it has been a rough week for sheep, many have not realized cost delivered to pens. Choice lambs, 7@7¼c.; other, 5@6½c

SWINE—Firm at 4¼c.; city dressed, $5.00@6.12, heavy to pigs.

Reading for the Young.

FOR THE BOYS.

E. P. P.

Boys ought to be sure that every animal or fowl on the place grows up a pet. It will surprise them to find the capacity which even hens have for learning to understand what is said to them. Let each calf, cow, horse, sheep and fowl, have its own name and be taught to respond to it.

I have a few sheep that invariably look up and speak to me as I go by the pasture. If I call one of the cows to the fence to take something from my hand, I should be ashamed to have them show timidity. Horses we expect to have intelligence, and expect them to show it; but hens we consider as fit only to eat and lay eggs. A few years ago I needed a hen to set on Brahma eggs. I borrowed a little, black top-knot. She hatched well and took good care of the chicks for a few weeks, when one afternoon I heard her at the back door shouting a genuine hen talk. She was trying her best to say something to me. She stepped backward and forward, and craned her neck and uttered the most eloquent sounds I ever heard from a hen's throat. This was kept up for ten minutes, stopping occasionally to eat. She then deliberately started off for her home, about five hundred rods away. I found the chicks where she had left them under the pie-plant leaves in the garden. They seemed to understand the whole affair and never inquired after the old lady.

Dogs are the only ordinary pets that I abolish from my land. They eat as much as a calf and very rarely do any good. They trample my flowers and howl nights, and are not quite safe. Cats are better; they save my young fruit trees from the mice, and are as useful all over my fourteen acres as they are in the house. Always keep two, so that they can have frolics. One of mine eats frogs like a Frenchman.

Invariably speak kindly to every creature, and show no bad temper. It will surround you with all kinds of friends that will make life a delight.

PRESENCE OF MIND.

A little time ago a young man died in Philadelphia who was popularly known, from his swiftness in running, as "Deer." His story was a singular one.

A few years since he was a ragged, shrewd lad, peddling newspapers about the railway depots. One day he happened to be on the line of the Pennsylvania Railroad, when he saw an engine rushing down the track without any driver or tender. By some chance it had been separated from the cars, and was driving on alone.

The boy knew that it would meet an express train this side of the next station. He had about four minutes' start, and darted down the track after it. The engine was, of course, not at full speed, yet nobody but Deer could have won in such a race.

He did win; was cool enough to remember the signal to the station-keeper necessary to have the switch placed so that the engine would be turned on to another track. It was done just two seconds before the express train went thundering by.

Deer, for this service, was granted by the Pennsylvania Railroad corporation a monopoly of the newspaper and book trade on its trunk route, and from this he derived a handsome income. It was to the boy's coolness, as well as to his fleetness, that hundreds of human beings owed their lives.

Another instance of the effect of presence of mind in the face of imminent peril occurred a few weeks ago in New York, when a manufactory employing several hundred hands was found, by a boy of twelve, to be in flames.

Instead of yelling fire, as most boys would have done, he went to the foreman and whispered to him his discovery. In five minutes the men were quietly dismissed, and it was not until they had reached the street that they knew the danger they had escaped.

A panic would have inevitably resulted in great loss of life. Now boys cannot be taught swiftness of foot, but they can be taught self-control, and the rare ability of keeping their wits about them in sudden danger, which is a much more useful quality.—*Ex.*

A WORD TO THE MEMBERS OF THE CLUB.

All agricultural and horticultural societies are now preparing for fairs and exhibitions, or holding meetings for the discussion of any and all topics in which they are interested. Our association is now four months old, in a most prosperous condition—fairly throbbing with energy and ambition, having any amount of surplus muscle for the wielding of the spade, rake and hoe, and with a rapidly increasing membership—yet we have not had a single meeting. Nothing could please me more than to have a convention of the members of the Horticultural Club arranged for the discussion of all matters in which we are interested; but since this is not practicable, as our members are scattered over the whole North American continent, from the Pacific to the Atlantic, and from the Gulf of Mexico to Lake Winnipeg, we can do the next best thing, that of holding our meetings in the Rural. I wish the members would make the best use of this, their only opportunity of exchanging ideas with one another. Write to me whenever you want information on any topic connected with the garden, if I cannot give it, perhaps some other member can. Tell us how you succeed, or even how you fail, it may assist others to better success and warn them of similar failures. I desire at present to have all the members send in reports in the course of a few weeks, as I intend to publish them either entire or in part in a special number soon to be issued. Uncle Mark.

FROM A MOTHER.

Dear Uncle Mark:—My two little boys, Frank and George, wish me to write to you and ask if you will accept them as members of the Horticultural Club. Both are interested in one corner of the vegetable garden. They spaded and raked the ground, and then what a time they had in selecting their seeds. They have radishes and beets and cabbage and tomatoes, all well tended and growing nicely. Both of them take a great interest in the Rural seeds, and I have promised each a share of the plants this fall; they think their flowers and vegetables are better than mother's. Every day they find some new wonder and pleasure in their garden. I think parents should do all they can to encourage a love for gardening in both boys and girls; it will be the means of keeping the boys at home and out of mischief.

Madison Co., Ind. Juliett Aldred.

LETTERS FROM BOYS AND GIRLS.

Dear Uncle Mark and Rural Cousins:—I promised to let you know how I was getting along with my garden. I have sold radishes and lettuce amounting to 77 cents, and I have still sweet corn, beets, peas, onions and potatoes left. About 12 days ago I received a package of radish seeds from Uncle Mark. I went right to work, leveled up my old radish bed and sowed my seeds; they came up nicely. I water them freely nights and mornings, as the soil here is very sandy and dries out quickly. I keep my garden free from weeds by hoeing a little evenings when I come home from school. Now, dear Uncle Mark, I think when I sell all my garden produce, I shall have money enough of my own to enable me to subscribe for the Rural. My little garden is 22 by 24 feet; but I find I can raise a great deal by taking good care of what I plant. Next to the care of our plants, it is of importance that we should care for our pennies, cousins. Keep them all together, and when you must spend money, spend it judiciously. Do not think I confine all my attention to vegetables, for I dearly love flowers. I have some of the finest Roses, I think, in the country, white, pink and black, (?) but the rose bugs are trying to get the start of me. I have other beautiful flowers. I received a Gladiolus bulb from Uncle Mark. I planted it in a suitable spot and it now looks very thrifty; to-day the leaves measure 15 inches in hight. Uncle Mark, my papa wants to know if we can raise two crops of potatoes in one year. For instance, you sent us the Beauty of Hebron—they are now nearly ripe; will it be possible to raise another crop from them this season? Will they sprout and grow? Now good-bye for this time. I hope to write again soon. Walter C. Gayhart,

Lucas Co., O.

[We raised two crops of the Early Rose at the Rural Farm last summer, the last crop giving fair eatable potatoes, though not so good as the first crop. The Beauty of Hebron being about ten days earlier than the Early Rose, I should think it quite possible to raise a second crop. I would not advise, however, to plant *all* of the first crop, as it *might* prove a failure.—Uncle Mark.]

Dear Uncle:—I suppose that I am one of the cousins, but it puzzles me some to tell whether I am a country or a city cousin, for I live only some three miles from the hub of the universe. I am not so favored as some in having a farm, but I spend my spare time in one of Nature's smaller schools, a garden. We can raise about everything in it except potatoes, which are rather strong, as most of our garden is part of a reclaimed salt marsh and is somewhat damp underneath; however, we have some hills of the Beauty of Hebron in the upper part, which are doing well. The W. T. radishes, (the seed of which we received from you, and for which we are much obliged,) will soon be large enough to eat, but little, black, snapping bugs riddle the leaves with shot-holes, and wood ashes and lime, are to them (the plants) almost necessities of life. We have plenty of green peas. Our corn has spindled out, and is running a race with the pole-beans, which have the best of it, although they have to go crooked, while the corn is straight. I haven't yet planted the sweet corn which you sent me, for the simple reason, that I haven't received it; I hope some postal official has not appropriated it, but if he has may it do him good. I don't have any pets, except a tame snapping turtle which I kept tied to a tree in the yard all winter so that he could not run away; but lest some one else should try to tame one of the same class, I will remark, that I did not dare to undertake to domesticate him, until his perishable parts had crumbled into dust. I suppose I have already written more than you care to read, so I will close. C. A. B.

P. S. Since writing the above I have received the corn, and return thanks. C. A. Butterworth.

Suffolk Co., Mass.

Dear Uncle Mark:—Please may I have one little place in the corner? I will be very quiet and only stay a little while, and will not come very often. I am sweet sixteen to-day and as I have nothing to do but to play on my piano, which was a birthday present from my dear papa, I thought I would clutter a little with Uncle Mark and my Rural cousins, to whom I have never spoken before. I always read the letters with great interest but never have had the courage to write, as I know I cannot write an interesting letter. I am a farmer's daughter, and a horse is my idol. I like cats and dogs but do not care much about other animals. Flowers seem to be the principal topic among the cousins now. I have no garden flowers this summer as our yard is in no condition for them, we having built our house last fall. I mean to have some nice ones next summer. I have a good many nice house plants.

I have just come out of school and am now learning to keep house. I like cooking very much. I am intimately acquainted with Madcap Mollie, who is also keeping house this summer. I think it nice for girls to know how to work as well as to play the piano and entertain company nicely. Well, enough of this, or you will never want me to come again. Your affectionate nieee,

Brookside, N. Y. Myrtle.

[Myrtle is heartily welcome and I shall be pleased to hear from her often. I am glad to hear she is interested in cooking. It is an accomplishment that ere long will be classed among the fine arts, and the few young ladies who know how to cook well will be acknowledged real artists.

Since Myrtle intends to have some flowers next year, and she already has some nice house plants, I recommend her to join the Horticultural Club.

Uncle Mark.

Dear Uncle Mark:—Please put my name on the list of your Horticultural Club. I have a little garden of my own in which I have planted cabbages, tomatoes, watermelons, muskmelons, radishes and peanuts, and having no raspberries to plant, I obtained some willows and set them in a corner of my garden. I have only lived two years on the farm, but this spring I dropped twenty acres of corn. One day last winter an elder brother and myself were chopping in the woods when we were suddenly startled by the furious barking of our dog. On investigating the cause of his excitement, we found that he was vainly trying to catch a weasel which had run in under a hollow log lying on the ground. My brother turned the log and the weasel ran out, but he was immediately caught and killed by the dog. I then brought him home to my sister, who stuffed him, and now he occupies a glass case in the parlor. I am only eleven years old. Your nephew, Geo. Shaw.

Washington Co., Ill.

Dear Uncle Mark and Cousins:—I thank you very much for those Gladiolus bulbs and radish seeds. Now, Cousins, we ought to do our best at gardening, seeing that Uncle Mark is so kind as to give us such a good chance. We have quite a large garden. I see in the Rural of June 7th that you tell us how to raise a great many garden plants. I shall try my best to raise those bulbs and seeds I have planted—the bulbs are doing nicely. My brother and I have hoed most of the garden, and we are going to keep our plants free from weeds. It rains nearly every day and the weeds grow very fast. We have 18 hills of water and musk-melons. I had one large water-melon last year about two feet long and nine inches thick; the others were not so large. I must soon close or I am afraid this will go into the waste-basket. Please excuse my mistakes and print my letter. Bob White.

Winnebago Co., Ill.

Dear Uncle Mark:—I have been reading the Rural stories and letters for some time, and wish to join your Horticultural Club. There has been some very good letters since March. Mother and father have been taking the Rural for some time, and like it very well. I have a piece of sod ground near a tree. I did not exactly know what to plant, but concluded to plant some pop-corn. I planted it about fifteen inches apart, and rather deep; it came up in a week and is now growing nicely, considering the dry weather. I expect to hoe it to-morrow. I had some pop-corn last year, too. It was nearly ripe, when the hogs broke in and ate about two-thirds of it, so I did not get much corn, though, as good luck would have it, I had some old corn safe. I am twelve years old. Please put my name on the list. Yours truly,

Morgan Co., Ill. Roving Bob.

Dear Uncle Mark:—I am 11 years old, and have a small piece of ground for vegetables and a bed of flowers. I have two little sisters and they each have a bed of flowers. I am raising my vegetables for the table. The seed you sent us is doing well, and I am to have some of the plants. The potato bugs came quite plentiful at first, but I destroyed them and their eggs as soon as they appeared. I have peas, beans, cucumbers, beets and squashes. I have also some of your millet, which I don't think will do much, for as soon as it came up it turned yellow. I want to join your Horticultural Club, if there is room for a Cape Cod member. Yours truly, G. W. Bourne.

Barnstable Co., Mass.

Dear Uncle Mark and Rural Cousins:—I will write to you again, hoping that this letter will be better than my last. I received the radish seeds, and was glad to get them. I have a small garden in which I raise radishes, lettuce, water-melons, musk-melons, cucumbers and strawberries, a few of each kind. I picked all the blossoms and little berries off my young strawberry plants, thinking that they will bear better next year. I go to school this summer; have a few flowers of my own. I will not tire you with any more this time. *Au revoir!* Clara A. Meeker.

Broome Co., N. Y.

Dear Cousins and Uncle Mark:—I have thought I would like to become a correspondent to the Rural, which we have taken since I can remember, yet this is my first letter. I am now twelve years old. I like to read the cousins' letters. We are to have a great many flowers this summer. I would like to join the Horticultural Club. I have two good-sized sage beds. I wish some of the cousins would tell me the best way to take care of it. I go to school, and read in the fourth reader and study geography, arithmetic, grammar, spelling and writing. Yours truly,

Leona I. Season.

Dear Uncle Mark:—I am a boy 14 years old, and am a great hand for flowers and vegetables. I have always had a vegetable garden in which to raise water-melons, etc., until this summer, but I am now working away from home by the month. I have two sisters, Rose and Letha, who belong to the Horticultural Club, and I also wish to become a member of that useful band.

Clermont Co., O. Amos S. Abbott.

Sabbath Reading.

ALWAYS JESUS.

Jesus is ever dear:
When friends beloved of old
Seem heartless grown or cold,
He, oldest friend of all,
Lists to our pathetic call:
Jesus is ever near.

Jesus can never change:
When lost our treasured wealth,
When lost is strength and health,
He ever is the same
In spirit and in name:
Jesus is never strange.

Jesus is full of love:
More than our cross he bears,
Each joy, each sorrow shares,
Increases every bliss,
Was ever love like this?
Jesus, enthroned above!

Jesus, our dearest friend,
In us thy dwelling be;
Make us a part of Thee;
Remove these stains of earth;
Give us that newer birth,
Jesus, our aim, our end.

[*Syracuse Journal.*

INFIDELITY AND CRIME.

We believe it to be susceptible of demonstration that the late extraordinary and deplorable increase of crime, an increase more palpable every day, crowding with its record the columns of the public prints and sickening the soul with its endless detail and novelty of horror, is largely due to the growth of materialism, or what is termed infidelity; and that mainly in reaction from the sceptical drift of the time lies the path of wholesome reform. The fruit of unbelief among the upper or wealthy classes is sensuality. Those classes get to worship instead of their Maker the pleasures of the moment. They bow down to rich food and fine clothes and enervating amusements. They make goddesses of women who possess mere physical beauty. Their hearts are set on yachts and race-courses and theatres and operas. What is given, in a word, to gild or soften life, to lend grace and sparkle and color to the plod and monotony of existence, such persons make its sole object and aim. Thus they become of the earth, earthy, and all that is spiritual and exalted dries out of their souls. One after another the Commandments are broken as they stand in the way of desire, and a shameful ruin is left at last in place of what might have been a perfect temple; a shattered and sated voluptuary in place of a nobly perfected human being.

Among the poorer and less educated ranks of society the cant and poison of living only for the day is even more directly disastrous. The rich can gratify their passions without, as a rule and in the legal sense, coming in conflict with the rights of others. But the needy, unrestrained by any fear of future account, and thinking only to eat and drink since to-morrow they die, drive straight on to crime. That this is no idle assertion can be abundantly proved. A careful survey of the murders, suicides and other great felonies committed in the chief cities of the United States during the last ten years shows that a heavy fraction of the perpetrators were atheists or free-thinkers. These unhappy persons, persuaded that life is the be-all and the end-all here, imagine that in their calculations they can jump the life to come. A collection of the letters or other papers left by criminals when anticipating death shows a fearful number of instances, some of which many readers will recall, of absolute disbelief in the existence of a God or in any reckoning for wrong done in this life to be exacted in a future one.—*Evening Post.*

THE KING IN HIS BEAUTY.

There was a celebrated painter, once, who was making a picture of Jesus in the midst of his twelve apostles. In arranging the picture he concluded to paint the apostles first, and not begin with their Master till he had finished them. As he went on with the picture, he tried to do the very best he could with each of the apostles. He took the greatest pains with their figures, their positions, their dress, and their faces. As he went on with his work he was very well pleased with it. After finishing the apostles he began with the person of Jesus. He got on very well with this till he came to the head and face of the blessed Lord. Then he laid down his brush and paused. He felt that the face of Jesus ought to be made to appear as much more beautiful than his disciples as the sun is more glorious than the stars. But how could he do this? He had tried so hard to make the disciples look well, that he felt he had no power left to make their Master appear as much superior to them as he ought to appear. And so he finished the person of Jesus all but the head, and then painted Him with a white mantle thrown over his head. He thought that when persons came to look at his painting, they would imagine what the face of Jesus ought to be better than he could represent it by painting. And I feel very much as that painter did, when I come to speak about the person and presence of Jesus in Heaven. All who love Jesus here on earth, agree in saying that from what they know of Him now, He is "the chief among ten thousand, and altogether lovely." Then how will He appear when our eyes come to "see the King in His beauty," in Heaven?—*Richard Newton, D. D.*

Sanctification does not consist in the perfection of knowledge, or in the perfection of our natural powers, in lights or in raptures, but in being delivered from all sinful desires and tempers, and filled with the pure love of God.

PERSONAL ITEMS.

Ex-Queen Isabella, of Spain, still holds her little court in a quiet way in Republican Paris.

Parker, the proprietor of the Parker House, Boston, began life as a coachman, and is now worth $2,500,000.

Mr. Spurgeon has a voice that can be heard in the open air to the very outer edge of a crowd of ten thousand persons.

One of the few Smiths in the country solicited money in Rutland, Vt., to build a church, and ran away with the $250 he collected.

It is formally announced in London that the business of the Baron Lionel de Rothschild will be carried on by the three sons of the deceased.

Ex-Congressman John A. Hyman, of North Carolina, a colored man, is now assistant to the mail clerks who run between Baltimore and Cumberland.

The Emperor of Austria is "a prince as is a prince." He speaks fluently nearly every one of the various languages in which the inhabitants of his empire-kingdom converse.

A physician at Salem, Ind., was addicted to opium-eating, and his neighbors tried to cure him by tying him to a tree, whipping him severely and making him take a vow of reformation.

It is easy enough to tell why Miss Sadie Kellogg of Waterbury, Conn, is called "Little Buttercup," when it is known that last year she made three-quarters of a ton of butter and disposed of it herself.

The report that John G. Saxe, the poet, is hopelessly ill, is said to be untrue by his friends. He is suffering from nervous prostration induced by a railroad accident three years ago, and there is a prospect of his ultimate recovery.

Swinburne the poet is forty-one years of age. Nothing has recently transpired concerning the rumor current some months ago that he had rejoined the Catholic Church. He was educated at the Jesuit college of Stronyhurst, near Liverpool.

Mr. J. Foster Kirk, the historian of "Charles the Bold" and the editor of Lippincott's Magazine, was married last week to Miss Olney, whose novel, "Through Winding Ways," has been one of the attractions of Lippincott's for some months past.

McMasters, an Ohio temperance lecturer, was taken suddenly ill in a railroad car, and a physician told him that a glass of brandy was the only thing that would save his life; but he refused to take the liquor, and died.

Imagine a quiet, amiable, gentle-voiced man, reserved in his bearing, fascinating in manner and handsome in appearance, fully six feet tall, about 48 years of age, hair just turning gray, face smooth, features refined, eyes blue, and you have an excellent likeness of Senator Butler, of South Carolina.

Senator Thurman, when he goes on a jaunt, wears a linen duster that completely envelops him, there being on his head a large silk cap. Mrs. Thurman, who was with her husband when he sailed on Monday for the New England coast, is a small, delicate lady, with white hair and long curls.

The Emperor William sleeps on a bed hard enough to have suited the Duke of Wellington, does not smoke or use snuff, is fond of flowers and especially of fresh air, drinks one glass of Burgundy a day, rises early and fares frugally. He is eighty-two years old, and can ride horseback like a trooper.

The celebrated French actress, Sarah Bernhardt, is now visiting London, where she is creating a *furore* both at the French theatre there and by acting at private parties. She is exceedingly thin, which accounts for the end of a conversation heard lately before the Theatre Francais: "An empty carriage stops, and whom do I see get out of it but Sarah Bernhardt."

A sad event has occurred in the family of asteroids. Hilda is lost. One of the nearly 200 members of the planetary sisterhood revolving between Mars and Jupiter can no longer be found in her accustomed celestial haunts. It is not known whether Hilda has eloped with her father's coachman or has run away and joined a traveling "Pinafore" troupe.

M. de Lesseps, of Suez Canal fame, and who has now in hand the Darien ship canal, is 74 years old, but looks 50. He has a high, bold forehead, is rather thick-set, with snow-white hair and moustache, and the piercing eye of an eagle. After the completion of the Suez Canal he married Mlle. de Bragard, a very beautiful and accomplished young lady, only 40 years younger than himself. By his first wife he had two sons, by his second seven children.

Supervisor I. H. Cogswell of Greenwood, Mich., was administrator of an estate, and, being called upon to render an account of his trust, set fire to his house, which he had drenched with kerosene, and burned himself to death, together with the papers connected with his business affairs. He tried to persuade his wife to remain in the burning building, and when she escaped he followed her out to urge her to go back and die with him. She refused, and Cogswell, flinging her some money, stepped back into the house.

Daniel F. Davis, the Republican nominee for Governor of Maine, fought under the flag. He was born in Freedom, Waldo county, thirty-six years ago, and in early life worked on a farm. At the age of twenty he enlisted in the First District of Columbia Cavalry and afterwards in the First Maine Cavalry, serving altogether two years as an enlisted man. While in the service he pursued his studies, having his Latin grammar with him in the saddle. He was admitted to the bar in 1869 and has since practised at East Corning. He was a member of the House in 1874 and of the Senate in 1876.

No matter what your feelings or ailment is, Hop Bitters will do you good. Prove it.

Implements and Machinery.

THE FARMER'S FAVORITE

WINE & CIDER MILL.

IT HAS NO EQUAL IN SIMPLICITY, GRINDS FOUR DIFFERENT GRADES OF PULP.

We make three sizes.

No. 1, Family Mill.—Two curbs, holding about 5 pecks each.

No. 2, Family Mill Press—has capacity of 1 barrel.

No. 3, New Power Mill.—Two men will grind 35 to 40 bushels hard apples per hour. By power will grind a bushel a minute. Its press has a capacity of 75 gallons at a pressing. Send for circular.

HIGGANUM MFG. CORPORATION, Higganum, Ct.

Manufacturers of Agricultural Implements of all descriptions.

BIRDSALL ENGINE.

Possesses More Points of Excellence than Any Other now Offered.

IT CERTAINLY STANDS UNRIVALED IN EFFECTIVE POWER, AND THE SAVING OF FUEL AND WATER.

Its saving qualities are super-excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times, much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves jobs, saves money, saves reputation, and preserves the good will of all. Trial given in all cases before requiring payment.

New Publications.

The Voice of Worship,

For Choirs, Conventions and Singing Schools.

BY L. O. EMERSON.

This splendid book is now nearly through the press, and will be in great demand. Full collection of the best Hymn Tunes and Anthems for Choirs, numerous Glees for Social and Class singing, and a good Singing School course. Its attractive contents, with the low price ($1.00 or $9.00 per dozen), should make it the most popular of Church Music Books.

THE TEMPLE, *For Singing Schools, Conventions and Choirs.* By W. O. PERKINS, will be ready in a few days. First class book for Singing Schools, with large collection of Glees, and plenty of Hymn Tunes and Anthems. Price $1.00 or $9.00 per dozen. Although Singing Classes are especially provided for, both the Secular and Sacred Music render it one of the best Convention and Choir Books.

FATINITZA. The new and very favorite opera, is now ready, with words in three languages, all the Music and Libretto complete. Price $2.00 paper, $2.25 boards.

PINAFORE. Price reduced to 50 cts. The same elegant edition heretofore sold for a dollar. Complete Words, Libretto and Music. All ready for the stage.

Any book mailed for retail price.

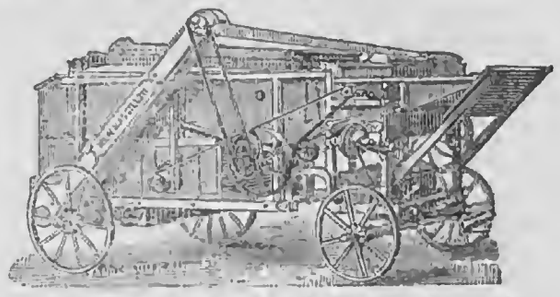
The "New Massilon"



THRESHING MACHINE

Beats the World!

SEE WHAT PEOPLE SAY OF IT:

F. F. Curtis of Orleans, Va., writes:—The Ten-Horse Engine I bought of you proves to be one of the best engines I ever saw run, and it gives perfect satisfaction. The "New Massillon" is one of the best threshers I ever used. It will thresh in good wheat 4 bushels per minute, and clean it ready for market. There never was a machine made which will separate the straw and chaff from the wheat better than this machine will. It gives perfect satisfaction everywhere I threshed, and I had no trouble to get customers. Every person who saw it run wanted me to thresh their wheat. It will over-pay for itself in one season, and I will recommend it to any person who wishes to get the worth of his money.

4 Sizes, Capacity from 300 to 1,500 Bushels.

WHEELER & MELICK CO., ALBANY, N. Y.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always disperse, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO., BUCHANAN, MICH.

MATTHEWS' SEED DRILL

17 MAIDEN LANE, New York, Sole Agents for the United States.

Wit and Humor.

ALPHONSE KARR wittily said touching the abolition of capital punishment for murder: "By all means, only let messieurs the murderers give the example, and cease to execute us."

THIS is French: A widow is bewailing the recent loss of her husband. "I have at least one consolation," she sobs out, drying her tears. "At all events, I know where he spends his nights now!"

TO BE trusted: One grocer asked another, "Is Colonel —— a man to be trusted?" "I think you'd find him so," was the reply; "if you trust him once, you'll trust him forever. He never pays."

A MAN asked for admission to a show for half price, as he had but one eye. But the manager told him it would take him twice as long to see the show as it would anybody else, and charged him double.—*Cincinnati Saturday Night.*

IT IS believed by some to be lucky if the initials of a wedding couple spell a word; but do not tell Frank Osborne so, unless you want to see him mad. He married Olive Lena Smith, and, if we know anything, an F, two O's, an L and an S spell fools.—*Erie Herald.*

A FRENCH newspaper says that in a certain Irish cathedral there used to be shown three skulls, one little one and two big ones, which the guide described to visitors as the skull of St. Patrick when he was a child, the skull of St. Patrick grown up, and the skull of St. Patrick as an old man.

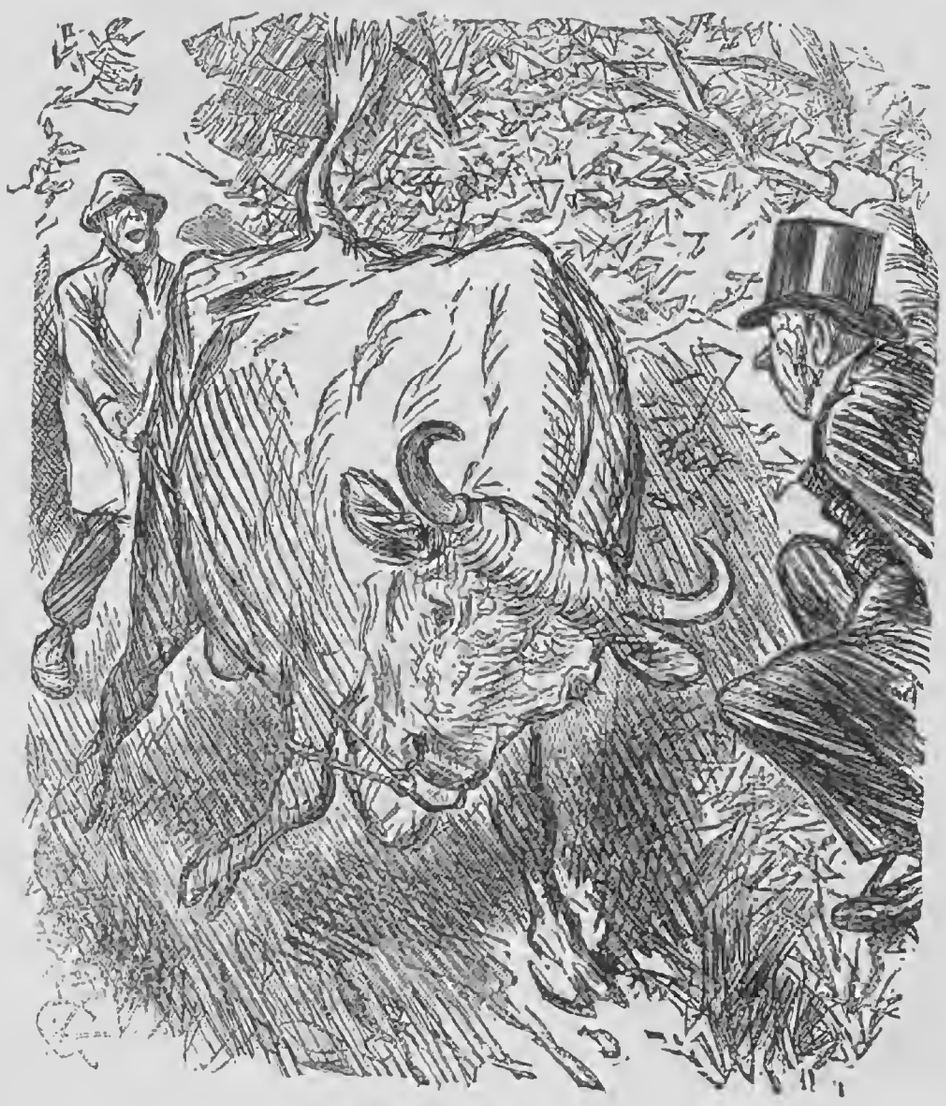
"AND how does Charley like going to school?" kindly inquired a good man of a little six-year-old boy, who was waiting, with a tin can in hand, the advent of another dog. "I like goin' well enough," replied the embryo statesman, ingenuously, "but I don't like stayin' after I git there."—*Rockland Courier.*

GENERAL GOURKO, Governor of St. Petersburg, is a very practical man. He received a letter which said he would be poisoned. Not at all alarmed he sent for his cook and thus addressed that personage: "You see this letter. Read it. Very well. Now keep in mind, the first time I get the colic I will hang you."

STANDING before a fruit stand a San Francisco gamin said: "Hello! old fellow, how much for your oranges?" "Twenty cents a dozen, sonny." "Do you throw the thirteenth into the bargain?" "Yes, my lad." "Well, give me the thirteenth to-day and I will buy the dozen of you to-morrow."—*San Francisco Golden Era.*

A MAN who made a business of writing obituaries, epitaphs, etc., used to solicit patronage far and near. Hearing of the death of a man in a distant part of the country, and busines being a little dull, he made a journey there. Finding the widow of the deceased person he stated his occupation, and asked if she wouldn't like a few lines about her husband. "Lines about him!" she said, wofully; he had all the lines he wanted. If he had had one line less, he would have been alive to-day." "What ailed him, madam?" "He was hanged."

"I USED to think I was a good economist," said Aunt Betsy, "but la! these hard times have educated me over again. Seems to me I can make a dollar go twice as far as I used to. Instead of painting my kitchen floor this summer I am going to paper it with common wall paper, something plaid, and varnish it. You can't tell them from oil-cloth. Miss Peters has got one on her entry that has been in wear seven years. She varnishes it every year and keeps a door-mat down. It doesn't cost as much as paint, and looks much better." Perhaps some of our economical readers would like to try some of these hard-times receipes.



REASSURING.

Old Gent (suddenly turning corner in narrow lane). "Oh!—I say!—Is he?—Will he?"—(backing into Hedge.)—"Can he ——?"
Farmer—"Don't take no notice of 'im, Sir! I've got a wee bit check on 'im if he runs!"

A Partial Blockade

Of the main avenue for escape of refuse from the human system is utterly subversive of regularity among the other organs Let constipation become chronic, and, leaving out the imminent danger of inflammation of the bowels and their total obstruction occurring, jaundice is almost certain to ensue, the liver is liable to become engorged, the blood and urine are poisoned by the bile, which also vitiates the juices of the stomach, and other unhappy consequences follow. Hostetter's Stomach Bitters, a prime tonic alterative, prevents or remedies these results and their cause, as the case may require, and is also signally efficacious in overcoming flatulence, heartburn, and variable as well as constipated action of the bowels. It renews nerve power, improves the appetite, stays the progress of early decay, relieves the infirmities of age, and is a pleasant appetizer.

AWARDED HIGHEST PRIZE AND ONLY MEDAL

The Herdsman.

GRADE JERSEYS.

COL. F. D. CURTIS.

A Town Converted.

It took eight years to do it. The first Jerseys were laughed at and considered more than worthless. "The idea of making beef out of such cows!" "The poor, scrawny, spindle-legged things won't weigh anything." "What can they be good for?" "My old Line-Back is twice as big," says one. Says another: "There's my old Brindle; she will give more milk than any one of them, and dress double." "Give me the Short-horns. There's Esquire Myers, he has a Short-horn bull which will weigh more than 2,500 pounds. That's the kind of cattle for me." "When you kill one of them you have got something." "Did you ever see Jones's cow? Her last calf weighed 'most a hundred pounds when it was born." "That is a model cow."

Such were the remarks and the reasonings when the Jerseys first came into town. Cows are kept here to make butter, and this was the kind of philosophy their owners indulged in, sitting on the nail kegs in the store, or where neighbor chanced to meet neighbor, and neighborhood affairs were gone over. All men are not fools; all men are not full of prejudice; all men are not bigoted. Some men think for themselves; some men reason. So some men said: "We will try this new Jersey blood, and if there is any good in it, we shall have the benefit." "We can afford to pay a dollar for a calf if it is any improvement, and the owner of the full-blooded bull ought to have pay for his outlay and trouble." "'Tis true, we can get the use of native bulls for nothing; but if these Jersey cattle are what they are said to be, 'a better breed,' that is what we want." "We keep cows to make butter, not for beef; let the West do that." "It is true old Rose is a good cow and hard to beat, and so are old Brindle and Line-back, but they never had a heifer calf as good as they are." "It is haphazard business trying to get good cows from our best natives, all the rest of our cows are only middling." The farmer with good judgment and forecast said: "I will try a couple of my best cows, anyway, and see what I can get. I don't believe much in new-fangled notions, but then other folks know a thing or two as well as I do, and all of this talk in the newspapers and these big prices for Jerseys, must mean something more than mere fancy, for that would die out unless there was something behind of actual value."

There were less than a half-dozen heifer calves raised the first year, half Jersey. When two years old, they were cows. Old Rose, Brindle and Line-back looked at these symmetrical and modest little intruders with wondering eyes, and felt sure of their laurels. They filled the pail brimful, while the delicate-looking little missionary Jersey stopped at "half full." The housewife had to admit that the "half-pailful" looked the richest. The milk was yellow. After a while she thought it fair to strain the Jersey milk by itself to see what it would do. The cream was "awful thick." The old favorites' milk was put alongside. It made quite a row of pans; but after standing twelve hours longer than the Jersey's, so that the cream would all get up (it takes longer), the Jersey's was much the thickest. In due time both sets of cream were churned, and the Jersey's came out ahead. "We will see," says the old-fashioned housewife, "what a week will do." There was a trial of a week, and the Jersey was ahead, and she has kept ahead, beating the native as a rule every time.

Seven and eight pounds of butter a week are a good yield for native cows, but a number of grade Jerseys make ten, and more. They are hardy, and some of them are as handsome as the pure-bred. Every farmer can not afford to buy thorough-breds, but every farmer can afford to breed his cows to thoroughbred bulls and to raise the offsprings. Such cows now command ten and twenty dollars more in this town than the best natives, and are worth it for practical use. The beef notion in a dairy cow is getting out of the heads of our dairymen. More sensible and liberal ideas prevail. Croakers croak no more. If one begins, he is laughed at. Facts are thrown at him right and left. Ten pounds, eleven pounds, twelve pounds, twelve and a half pounds a week of solid golden butter, which sells for five to ten cents a pound more than the best from natives. These facts shut him up. They come from the converts—the old doubters. They are full of zeal, and want more Jerseys. They come from twelve miles away.

The butchers say the calves make the nicest veals. They are always fat, and dress white. The beef is tender and juicy, and of the best quality. A good Jersey bull, of undoubted pedigree and promise, a year old, can be bought for $75 to $100, of breeders who are now veterans in improving this breed. A bull, carefully fed and handled, will answer for a whole neighborhood, and will add hundreds of dollars to the butter product in a few years.

EARL BECTIVE'S DUKE OF UNDERLEY—FRONT VIEW.

OUR ILLUSTRATION above gives a very fine front view of Earl Bective's admirable bull, the Duke of Underley, a side view of which was published in our issue of the 12th inst. Both have been reproduced from the Agricultural Gazette which is doing good work for stock raisers by presenting from time to time very excellent likenesses of animals which have won well merited reputations.

The Poultry Yard.

THE TRUTH ABOUT IT.

Artificial Hatching and Rearing Chickens.

EVERYBODY seems to be looking out for a "royal road" to success in his favorite pursuit. Perhaps the most attractive idea at present prevalent is the artificial hatching of chickens and their rearing by means of "mothers" and cramming machines. A sensational story, at first published about three years ago, is still going the rounds. It was in reference to an enormous establishment, where thousands of fowls were said to be prepared for market every season. As might have been expected by any practical poultry-keeper, this concern turned out to be a disastrous failure in a very short time; but still the story of its institution goes the rounds to delude and mislead, and no notice whatever seems to have been taken of its collapse. So with the several different methods of hatching eggs in incubators; a great deal has been said about them and their wonderful possibilities, but yet they are all very much the same as the dream of the young female in the ancient story of the child who counted her chickens before they were hatched.

The truth of the matter is, that while there is no difficulty at all in hatching eggs, or chickens, (whichever may be precisely correct, I say not) there is a great difficulty in rearing the young things when they come into the world. At the same time, it is a remarkably patient, persevering and *knackful* person who can succeed in artificial hatching. One in a hundred or a thousand might do it, if he or she gave the whole mind to it. The neglect of an hour, nay, of one minute, one mistake, one accident, one error of judgment, and the whole batch is spoiled. A lady who thought she could succeed had an incubator made (thereby infringing a patent-right), and, with singular ill judgment, put 240 eggs in the machine at the first trial. Everything went well up to the time when there was a promiscuous peeping from nearly all the eggs, and the operator's hopes ran high. Almost the last day, the manure heap got into a tremendous heat and sweat—possibly it was trying to make a sure thing of it, too—the thermometer went up to 120 degrees, or perhaps higher (it was found marking that), and the prospective chicks were baked before their time. Another batch of 20 dozen eggs was procured, another load of manure was heaped around the machine, and a second attempt was made. About the middle of the operation the manure cooled down, and, in spite of liberal kettles of hot water to warm it up again, the heat could not be brought back, and another batch was lost. The husband suggested how much cheaper it would have been to have bred with one dozen eggs instead of 20 dozen, but "men's ideas are so narrow," etc. If it had only succeeded, there would have been at least 200 chicks; at least 150 of these would have come to broiling age and brought 50 cents each; $75 would —— Alas! it is the old, old story: "the girl gave her head a toss, the basket of eggs came to the ground," and there was an end of all her grand figuring.

The truth of it is, in poultry-raising, as in all other productive pursuits, there is no royal road to success. There must be work, and this must be done with knowledge and skill. A living organism brought into existence abnormally and unnaturally, must be nourished and nursed in the tenderest and most precise manner. It is not enough for us to say the Arabs and the Chinese have done this thing with success for centuries. Who, that knows how the business of these people is done—the days and nights spent in fetid, filthy, overpoweringly odoriferous and heated underground dens, called ovens—would assume their horrible operation for their reward? It cannot be done by civilized creatures without the expenditure of at least 150 cents' worth of trouble and bother for every dollar gained by it. If this is not the truth, let us hear from some one who will show to the contrary. In the meantime, all those persons who are anxious to try their skill or their luck with an incubator, should make up their minds not to count their chickens until they are hatched.

HEN-RY.

CONFINING POULTRY IN SUMMER.

SMALL farmers and fruit-growers make a great mistake when, for the reason that roving fowls do a great deal of harm, they put them in close confinement. Of course, if they are allowed to roam at will, much mischief will be done to garden crops, in money value far exceeding the worth of the chickens raised, but it is a short-sighted policy to shut up the hens, —better shut up the garden. A few movable shutters, if there be no fence around the garden, can easily be made of half-inch stuff, costing but little for time and material, and these fastened with light pickets driven in the ground, will prove an effectual barrier. Or, if there is already a fence, a few additional slats will generally render it fowl-proof, and allow the hens and broods to range the farm with impunity. Another plan that I am successfully trying this year, is to put the garden stuff out of reach of the chickens at some spot as remote as convenient from the hen buildings. If fowls are moderately well looked after in the way of providing food for them, they are not disposed to roam a great distance from home, and if in their wandering they come upon our patches of cabbages, tomatoes, etc.,

their appetites are generally so satisfied that they do little harm. Their principal depredations are in the early morning on alighting from the roosts. If, then, they come upon grass instead of more valuable greens, their keen appetites will "go for" that. It is not easy to calculate the good, in destroying insects, poultry do when roving the fields, and this is a strong argument to the fruit-grower not to confine them; for not only does he need them most at this season of the year, but a great part of their food will, in this way, cost him nothing.

Again, it is almost impossible to raise large and fine chickens if they do not have access to a large range, where their growing frames can have exercise and where they themselves can find food suitable for their wants. To give this last in confinement must greatly increase the cost of raising. Upon the development and vigor of the young birds depends the egg-production of the following winter, and it is therefore to the breeders' interest to see that they are not stunted. I have been very successful with poultry here on our dry soils, never having been troubled with disease, and hens have laid well at almost all seasons of the year. My flock of thirty Leghorn crosses *netted* me for eggs alone in less than four months, last winter and spring, over $1 each; and, accidents aside, all of our spring-hatched chickens are living. G. A. M'B.

Bricksburg, Ocean Co., N. J.

GAME, RABBITS AND POULTRY.

ENGLISH pheasants, hares and partridges might be introduced into the South, and the wealthy classes in the United States might enjoy field sports with the finest game in the world, in addition to the kinds already plentiful here. Both from a commercial and agricultural point of view, it would be a very good speculation to establish English game on an island, or any estate which could be held safe from enemies, and by doing this in conjunction with poultry-raising, on the "egg farm" style, and combining raising rabbits, also, a magnificently gigantic undertaking would result, and be astonishingly remunerating; for, once establish an enterprise of this sort, and the stock being all prosperous and acclimated, there would be such a demand for the increase that the profits would be very great.

The rabbits might be of the tame species, and if well managed and given liberty, they would increase amazingly and their flavor be so improved by running at large that they would sell readily at a great price, because it would be quite a novelty for them to be brought to table weighing three times as heavy as the common wild breed and tasting equally fine, for, of course, the disagreeable taint of tame rabbits is owing to their close confinement in hutches or other small spaces.

The writer has experimented in England and in the United States with rabbits, and proved the profits to be great. He has raised all kinds of game and had the superintendence of deer in one of the best managed parks in England, so that he knows all about such animals' habits and the requirements for their prosperity, and, of course, he and everybody know that deer and rabbits are so fond of the bark of young trees that if there are any which it is desired to be unmolested, they have to be protected.

Why these different animals are all mentioned together is that, by their being all kept on one estate, those in attendance upon the poultry, and who are continually around, would be a constant protection to the wild and semi-wild animals, which would take care of themselves if all enemies common to poultry and game were exterminated. Rabbits running at liberty will breed very young, and do well, too. There is a ridiculous idea that the bucks kill the young ones, and also that young does cannot raise their young. Some old-womanish men will say, also, that some of the little ones should be destroyed, so that those remaining should be stronger. Protect them from skunks, weasels, minks and cats, and nature will regulate the age at which to breed, and also the number at a birth. If a man going into such a business had sufficient capital, it would be a great additional profit to breed colts and other young stock, placing a few horses in each field and giving them a shed to have a feed of oats, bran and hay in during the fall, winter and spring, and if not fed during summer, it would be a resort for shade; and at such places roosts could be combined, and the fowls be much healthier for the animals being there. Calves, too, could be kept at other places, and sheep, also, might have a shelter for such weather as they chose to protect themselves from.

Where the winters are comparatively mild, the young stock of all varieties will do better by lying on blue-grass, or any natural permanent grass land, and being fed twice per day in comfortable sheds; and this will make it better for the poultry, as it adds to the health. The scratching among the litter and manure is suitable for hens, and is something as essential to the perfect well-being of common fowls as the range over the natural ground in search of green herbage, grubs and worms. Talk about stock-raising! Imagine lots of colts, calves, lambs, and the best that can be produced of chickens; or, say horses, cows, sheep, geese, ducks, turkeys, hens of every variety—and all, with game interspersed, being beautiful and of the most fashionable breeds.

POULTRYMAN.

RAISING POULTRY.

THE losses in the poultry business are far greater than the profits, and still the profits will average at least fifty per cent. per annum over the outlay. Paradoxical, you say? Granted!—but did you know that a paradox is *always true?* I will make the assertion that a hen always knows what is best for her, while her owner never does, except in some great emergencies—a storm for instance.

Disease, almost entirely unknown to birds in the wild state, is the canker which causes all the loss referred to above. Disease is the concomitant of civilization in man, and follows every attempt to bring poultry to our level. Hen houses breed more vermin than artificial dust baths will remove; they gradually render poultry delicate in constitution, and thus more and more unable to repel any disease which change of diet, weather, or forced habits may invite. Stock thus deteriorates, eggs fail to be fertilized, chicks are tender, mothers abandon them too soon, and the artificial state which fancy food produces, interrupts the laws which govern health and success.

Civilized man must, to a certain extent, have his poultry cared for in a rational manner, and, as "forcing" is supposed to be the foundation of profit, and, as much profit is desirable, much forcing is resorted to. More stock is lost, more weak and worthless stock is produced, and more loss sustained by over-anxiety and petting, than many imagine.

A strict account of the number of eggs set, the number which hatch, the total arriving at maturity, and finally the actual number of really profitable fowls sold or carried over winter—which includes good, steady layers, good mothers, and vigorous fathers—would give such an insight into the waste in the poultry department as would create wonder "that hens paid at all."

There is nothing in business pursuits like facts. Every one is full of fancies, theories, notions, cranks and crudities, but hard facts are never thought of.

All the diseases of poultry are directly the fault of the owner. They are the consequences of too much or too little care being bestowed on them. The successful poultry breeders are, in every case, those who, instead of compelling stock to walk a chalk mark, only interfere when some sudden emergency arises which the chicken is not equal to.

Food and water ad libitum, in variety, shelter in various places and of several kinds, room to wander at will, perfect freedom from annoying animals, both wild and domestic—in fact, absolute wildness, with only a few of the "modern improvements"—a yearly change of male stock, and a share of common sense (not quite so much of the uncommon sort), will do much toward making poultry pay better than any other branch of farming.

Elevate the stamina, select so as to suit the climate and soil, ward off all loss through foolishly devised safeguards, then give the old hen her full enjoyment of instinct, and the yearly account will show a profit of from 100 to 200 per cent. I have pursued this plan for many years, have had no gapes, roup, pip, cholera, or other diseases, and don't know them, absolutely.

My remarks are founded on facts, hard facts. My old hens and I together have just enough common sense between us to succeed perfectly.

Dodge Co., Neb. S. RUFUS MASON.

Farm Economy.

MORE ABOUT PEAT MUCK.

GEN. W. H. NOBLE, BRIDGEPORT, CONN.

It is not to show myself in print that I write for the RURAL. I crave no audience for farm or rural fancies. Such are plentifully rife. But I aim to help rural life to brighter hope in enterprise, to quicker grasp of the resources on the farm, to better finance than hoarding the sixpences and starving the land. There are about it bottom facts and sense not only got down to by study, but that he who runs may read. There are graceful tastes unwonted to its life, which call for brighter-mindedness, lighting up the home and its surroundings, yet heeding well to thrift and profit. As one help to the fulfillment of such hopes and purposes, I have put at the front, peat-beds and muck, as grand treasures of farm enrichment. I have strongly urged their deep stores as the salvation of New England and Eastern farming, their best estate, gained by tarrying in the barn-yard and compost heap, I have stated. No fine-spun theories about humus and geine, ammonia, nitrogen and carbon, have been woven. I have dabbled in no chemical wrangle about what the ages have grown, or drifted into the peat-bed's deep decay. These I have left to the alchemy of plant life to feel out and tell of in crops. My last call was on simple common sense; short of manure, seek in this store of vegetable life and death, food to deepen the soil and swell the harvest. Let science settle down on the way things grow, and what out of, what is plant food, and what mere stimulus. It will be time enough then to dose out nourishment by parts and formulas. Till then, let the farmer hang up his little scales, and pile on and plow under the richness stored in the muck-beds. It will rise to new life in brimming grain-bins and barns well filled. So doing, common sense can afford to wait a supply of exact science on the farm.

In this line of talk, among other things, to the farmer short of manure and long of a muck bed, I plead for a liberal use of raw muck, turned out to the handling of the wintry elements. Yet I found the editor, or staff, telling some anxious inquirer that peat muck was not fit to use till composted with barnyard manure or lime; that it needed ferment to rend its fiber, and the lime to quell its rank acids and astringency. Such delay and handling form a good general rule; but this did not help in a dearth of manure for quick and large use. So, in the RURAL of March 15th, last, I claimed this shortness could be relieved by peat muck carted in freezing weather onto grass, grain or plowed land; that there the wintry frosts and thaws and storms would rend the fiber and drench and turn out its bitterness and acids. Right here the editor stuck in a (?). Then came to the front a "Western Farmer," in the RURAL of April 12th. He says he knows a good deal about peat muck; "that frost and wet and thaw won't rend its chunks;" that only fermentation will do this; that raw peat is not fit plant-food, and only gains that fitness by decomposition, which comes with warmth and moisture; and, all in all, that Gen. Noble was, in his advice on March 15th, "wide of the mark." He warns the farmers against such a blind guide.

Now, "'tis pity if 'tis true!" Is it true? Whether "Western Farmer" or Gen. Noble is right, as a personal question, is of no sort of consequence. But to the farming world, the right about it means either thrift and crops, big harvests and thriving stock, or toil worse than thrown away, as Western Farmer says his was on ten acres covered deep with raw muck. Now, our Western brother may "know a good deal about muck;" but I hope to show him, and all, that there are some fixed and tested facts about peat muck "not dreamt of in his philosophy." Let's see. Three propositions cover all I claim for peat muck:

1. That raw muck is fit plant food.
2. That it is powdered by the wintry elements, to readily spread and mingle with the soil.
3. That crops in reach of such enrichment, should not wait for its handling in rich farmyard and compost heaps.

"My offense hath this extent, no more," and these three propositions "I am bound to maintain." If the first two are sound, the third becomes self-evident.

Now, let there be no mistake about what I mean by raw peat muck. It is that under-tier and black rot of vegetation above which rests a top spit and pack of mossy filaments, roots, leaves and undecay. Some of this unleavened upper-crust must have made up the "chunks" which so bothered our "Western" friend's ten acres. Such I have not often seen turned out to weather. But when so treated, wet and raw from its bed, frost rends its pack to shreds. This result so follows such handling that the peat chunks, defiant of frost and thaw, which "Western Farmer" so berates, would seem made of "sterner stuff." Possibly his top spit tier of undecay is ranker and heavier than that which blankets New England muck beds.

Let's note another thing: Not all raw peat fulfils its promise as ready fitted plant food. Some peats are possessed of seven devils of acidity, which only curing alkalies, or long weathering, can cast out. Luckily, such deposits are rare, at least in New England. Most of ours are fit plant food as soon as the frost tears the stuff into fineness fit to easily spread and commingle with the soil.

Now let's see about this fitness and the rending power of the frost. Professor Johnson, of Yale Scientific School, and now Director of the Connecticut Experiment Station, has put out a sound and exhaustive treatise on peat and its uses. It is full of common sense, and eminently practical. It is a record of all the alchemy of the bog, and of all known about its use in the arts, as plant food, or for fuel. His chapter on its agricultural use, without whims or theories, records just the hard-pan facts and tests about peat. He lays down four faculties of peat:

1. Its power of holding water and water vapor.
2. Its power of absorbing ammonia.
3. Its solvent power on the mineral elements of the soil.
4. Its raising the temperature of the soil.

Then follow four propositions as to the plant food and stimulus in peat.

1. Its organic matters, associated with ammonia and nitric acid.
2. Its inorganic matters.
3. The benefit of its decay in the soil.
4. Raw peat equal to stable manure.

Now, under those heads the Professor fully proves, by scientific analysis and the tests of trial, all I have claimed for raw peat. Specially, on page 59, he says, "Most peats might be used perfectly fresh," but for the difficulty of reducing them to the proper state of division, for admixture with the soil. Then, on page 60, he says that frost speedily reduces fresh, wet peat to pulverization; that it should be exposed, when wet, to wintry weather; that such exposure works chemical changes—likening the quality of such peat to that of old soil. These positions he does not state as opinions; they are the condensed results of experience and scientific tests. As to my three propositions, the Professor records analyses of all prior tests, and proves them. But further, he reports five separate trials of raw peat by five practical Conn. farmers. They cover its use on grass, grain and hoed crops. All were favorable. In view of these tests, let no one be disheartened by the reported ill-luck of others. Science, observation and trial prove raw peat to be fit plant food, and show pretty plainly that I have not shot very wide of the mark.

Right views on this peat question are wealth to the land. Eastern farms are hungering for enrichment. Our big forests, ashes from whose clearings have sent so much food and stimulus to crops, are melting away. We shall not long have them to supply the land with what we so unthriftily exhaust. Even were the elements of the ash in untold store, they would be the better in fellowship with peat. Then, too, these deep deposits, to the extent of their endowment, must replace the waste plant food which pours through the sewers or is dumped in the garbage of great cities. The farm and garden need and should be choice of every manurial resource of the land or of the great deep. Of all these, none is so cheap, so close at hand, so vast, as the big peat beds.

I hope to awaken my brother farmers to this wealth sleeping beside their homes. I shall therein have done them a great good, and helped the land. Capital is sorely needed on the farm, but not half so much as brains and open eyes. Because the plain and present chances seem so small, or are so little studied, many turn their faces westward. The glamour and mirage in the distance "lends enchantment" that hides the discomforts of frontier life. The farmer, East, has everything to favor his stay. The country is built up in roads and homes, and steeples and close-by schools. The smoke of a neighbor's chimney rises quietly in the morning air; the light of his evening lamp invites you to his fireside; all over New England are ready and greedy markets, and cheap lands are growing up to bush beside deep swamps handy for their enrichment. Why go West? You and yours may thrive there. You can here, if you will. All you go West for is half in your sanguine hopes. They will only be realized through stint and toil and struggle with all the far-apart and unadjusted belongings of a new country. "Stay East, young man," or you may get bogged in a worse slough than that out of which "Western Farmer" dug those storm-proof chunks of peat.

Farm Topics.

PATENTS ON THE SLIDE GATE.

Testimony of Use Years Before the Patent was Granted.

PROFESSOR R. C. CARPENTER.

SINCE the article of Jan. 25th in regard to the existence of patents on the gates that open by partially sliding back and then turning, testimony has been gathered which shows conclusively that the gate has been in common use in various portions of Michigan and other States for more than twenty years. The importance to the farmers of defeating this patent, is very great; for the gate is now in extensive use all over the United States.

As evidence of extensive use it may be proper to state, that since the article of Jan. 25 in the RURAL, letters have been received showing it to be in common use in portions of New York, Georgia, Illinois, Indiana, Ohio, Iowa, Wisconsin and Michigan. In Michigan this style of gate is used more frequently than the ordinary swing gate. Hon. A. J. Heston, of Sidney, Iowa, says that in his business of stock feeding he has used these gates for 14 years. He uses them with a set of adjustable friction-

rollers hung on a swivel with the gate; these rollers are of his design and not patented.

As predicted in the article of Jan 25, the prosecutions commenced against farmers using the slide gate, for infringement of the Lee patent, proved to be nothing more or less than a means of extorting money. Of all the cases introduced before the court not a single one was prosecuted. The plaintiffs sought to defer the trial by every possible means, evidently for the simple reason of causing farmers additional expense. The judge in charge finally suspected this practice and ordered them to give bonds for the cost. This was done under protest and a plea of poverty from the plaintiffs. Finally, as the time expired for taking testimony, and no active prosecutions were begun, Judge Brown dismissed all the cases against the farmers, and ordered the U. S. marshall to collect the cost from the plaintiffs. Despite the worthlessness of the Lee claim, by making good use of their time, its owners succeeded in extorting over $5000 from the farmers of a single county in Michigan, who paid their demands, rather than take the matter into the courts. How much was collected on this worthless patent in other portions of Michigan we have no means of knowing. The farmers of the State are now partially organized to resist the farther collection of royalty under either the Lee or Teel patent.

The Teel patent can be defeated by showing that the slide gate was in use before 1861. Despite the number of years since this date, testimony that cannot be doubted, can now be brought forward to show that the gate has been in use since and before 1856.

I present a few letters received from different parties in regard to the early use of this gate. The first letter is from Mr. C. A. Sprague, of Alabama, who claims to be the inventor of the gate. He is probably correct in that he was an inventor, but as the gate was in use in Michigan at about that time (some claim as early as 1848) it is doubtful if he was the first inventor.

DEAR SIR:—Having just received the RURAL NEW-YORKER of Jan. 25, I notice on first page your article on the slide gate. I invented the slide gate in the year 1856, and have had them in use ever since. I never sought a patent on my invention, and up to the time I constructed mine, I never heard of any being in use. I then resided in Erie County, N. Y. I now live in Alabama; my address is Anniston, Ala. If you desire further information write me. C. A. SPRAGUE.

* * * * * *

Dr. Manley Miles, formerly Professor of Agriculture at our College, certifies to seeing these gates in use when on the State Geological Survey in 1858. He also had them constructed at the College early in 1863. Charles Curtis, Howell, Mich., and E. R. Merithen, of Osceola, made and used these gates in 1857. N. G. Noble, Drayton Plains, Michigan, built one of these gates in 1852. N. D. Landon, Orion, Mich., used one in 1858. T. B. Eldred, Climax, Mich., used these gates in 1861.

From the Detroit Post and Tribune of January 29, 1879, we learn that the following persons used the slide gate previous to 1861:

Charles Campbell, Van Buren, Wayne Co., Mich.; Audrew Martin, Ypsilanti, Mich.; Azariah Martin, Venice, Mich.; F. M. Holloway, Fayette, Hillsdale Co.; Lorin Riggs, Bellville, Wayne Co., Mich.; James Leonardson, Jefferson, Mich.; T. N. Wadsworth, Canandaigua, N. Y.; James Miner, Pittsford, Mich.; A. J. Leetch, Superior, Mich.; Thomas Blake, Ann Arbor, Mich.; John Van Voorhies, Canton, Mich.; Elias Forbes, Van Buren, Mich.; John Forbes, Brownstown, Mich.; J. C. Emory, Plymouth, Mich.; David Clarkson, Plymouth, Mich.; J. D. Yerkes, Plymouth, Mich.; George Yerkes, Novi, Mich.; George Hill, Northville, Mich.; N. L. Peer, Holly, Samuel Laiden, Canton, Mich.; L. C. Wallington, Ypsilanti, Mich.; Harvey Hubbard, Bellville, Mich.; S. P. Bray, Pittsfield, Mich.; H. W. Cowen, Moscow, Mich.

(The list in the Post and Tribune was fully twice the length of the one published here.)

The conclusion arrived at is that, although a patent was given to A. C. Teel, covering all varieties of the slide gate, he was in no degree entitled to it, the gate being in common use long before it was patented. The patent law provides for such cases as this by putting it in the power of the courts to declare such patents void. It is to be hoped that no farmer will pay royalty for the use of the slide gate to any parties, for by so doing, he not only forfeits his own right, but he contributes to support a class of men who, although working under protection of the law, are in other respects little better than swindlers. He should meet their claims in court rather than submit to taxation, however slight.

The owners of the patent given A. C. Teel commenced operations in the newer portion of the State, where they supposed they would meet with little resistance by the farmers. As soon as the character of their operations was discovered, a combination among the farmers was brought about by the grange, and nearly $1,000 were raised to defend all cases taken to the courts; meetings were held in the newer portions of the State, and such steps were taken as to make collection of royalty by threats, a decidedly poor business. A number of suits have been commenced, but it is not likely that any of these suits will be tried, for the same reason that the suits under the Lee patent were not prosecuted—that is, because the prosecutors are certain to be defeated. They will probably make a desperate effort to collect royalty, by threatening prosecution, and in some cases by actually commencing suits, but in the end it will terminate in the withdrawal of all the suits begun, and more to their discomfiture than to that of the farmers.

The case would have been far different in Michigan had the farmers not organized to resist this encroachment on their rights. It would have cost them, in all probability, nearly a million of dollars, instead of a few hundreds.

This case well illustrates the force of united efforts. Yet in Michigan these united efforts would not have been possible had it not been for the organized body of farmers already joined by the State and subordinate granges, and for the interest which the educational institutions and the press took in regard to the welfare of the farmer. The work and cost of organization have fallen mainly on these institutions—the grange, the agricultural college and the press—and yet, if these efforts are successful, every farmer in the State of Michigan and in the United States, using the slide gate, is benefited. Yet those persons who are benefited, and who are not connected with the organizations mentioned, will doubtless, in every case, give no credit whatever to them; on the other hand, such persons, ignorant and bigoted though they may be, will be found decrying the grange, if not for one reason then for another, and claiming that education is detrimental to a farmer, or, at least, that our educational institutions do not properly educate him, or raising some similar cry containing little reason or truth; and finally, practicing to a great extent what they preach by taking no agricultural paper.

It is needless to say that such a condition of things should not exist. If the few are still to do the work while the mass reap the benefit, then should the few who do the work be encouraged and assisted, not hindered as in the past. In regard to this gate matter, it is to be hoped that every man will contribute his mite, both of influence and money, to support the combinations formed.

Mich. Ag'l College, Lansing.

Field Crops.

WHEAT RAISING—No. 1.

H. L. WYSOR.

Virginia as a Wheat State.

THE wheat harvest ended here about the 1st of this month. While the quality of the grain is generally very good, the yield, a few fields here and there excepted, is much below that of several years past. The fields whose yield has been the greatest, are mostly those which were sown very early, the later-sown having been badly winter-killed. It must not be supposed, however, that the early-sown wheat always does the best here. This is true only when the winter turns out exceptionally severe, as did the last.

The winter climate of southwestern Virginia is a much harder one for a wheat crop to endure than that of New York, or indeed, of any of the Middle States. Those who look at the difference of latitude only, would not suppose this to be true, yet that it is, the facts will prove. Although the cold in New York is very intense, yet it is at the same time constant and continuous. Here, there are frequent alternations of freezing and thawing, occurring within a few hours of each other. These sudden changes are death to the wheat plant. At intervals, all through the winter, we have days, sometimes weeks, of weather as warm as any day in May, then, without any gradual change whatever, the thermometer drops suddenly below zero. In the warm days the wheat has become green and tender. The frost comes and bites the blades, turning them yellow. Then there may come a sudden thaw after the ground has long been deeply frozen, and the wheat plants are thrown out by the settling of the earth.

It may be surmised from this that, as a rule, southwestern Virginia is not specially adapted to wheat-growing. In certain localities and favored situations, as fine wheat is grown as any in the world. On the steep hill-sides bordering on the water-courses, where the soil is composed of slate or gravel, the quality of the wheat grown is of the finest description, although the yield on an average does not exceed ten to twelve bushels per acre, frequently not more than eight. Our section lies in what is called the Trans-Alleghany region and is better suited to grazing than to the raising of grain. Between the Alleghanies and the Blue Ridge lies the great Valley of Virginia, one of the best wheat-growing sections in the world. A few years ago, Maj. Jed. Hotchkiss, in a geographical lecture, stated that this valley produces 1-84 of all the wheat grown in United States. It is said to average 20 bushels per acre. It may be seen from this what a great difference, so far as wheat-growing is concerned, is made by one's happening to live on one or the other side of a mountain range. I propose to show presently that the difference is just as great between the two sides of a single hollow field.

As I have now been engaged in experimenting with different varieties of wheat for some eight years past, I propose to offer some of the results of these experiments to the readers of the RURAL. I shall first offer some general remarks, which, while they apply more particularly to this climate, are applicable, with a few modifications, to any part of the country.

Influence of Exposure.

In a broken, hilly country, it is throwing away time, labor and money, to sow wheat on a hill-side with a northern exposure. Even if the plants should chance to pass the winter safely—which is seldom the case—they will never mature. They will, in nine cases out of ten, be destroyed by the rust before they can possibly ripen. As a case in point, I have a hollow field which runs from east to west. Following the hollow and going west, one has a south hill-side on his right-hand and a north one on his left. From the middle of this hollow to the right, I have never seen the wheat fail to mature, although the yield was sometimes very indifferent; from the middle to the left, I never knew but one crop to ripen. On hill-sides the exposure must be either east or south, otherwise it would be better to sow rye in the fall or oats in the spring. In sections where the land is only gently rolling, these remarks admit of considerable modification.

Influence of Early and Late Sowing.

The time of sowing does not make any great difference in the time of ripening, as this latter is almost wholly controlled by the situation. On southern exposure, wheat sown the 1st of October, will ripen sooner than the same wheat sown on a different situation the 1st of September. In the fall of 1876, I sowed with Clawson wheat a field which consisted of an east hill-side that gradually sloped and spread out into a bottom. The bottom was sown a week earlier than the hill-side, and yet the grain on it ripened a week later. Early sowing exerts its influence on the tillering power of the plants, and enables them to get better rooted to withstand the winter. For this reason, one bushel of wheat would be sufficient for an acre if sown the 1st of September, two bushels the 1st of October, and three bushels the 1st of November. Some varieties, as, for instance, the Boughton, do most of their tillering in the fall, and consequently, in order to succeed, they should be sown very early; others, as the Fultz, tiller mostly in the spring, and may be sown later. It may be set down as a rule, with few exceptions, that the large-grained wheats ripen late, the small-grained, early.

Long and Short Ears.

The length of the ear does not have as much to do with the number of grains contained in it as many suppose, since the intervals between the spikelets in the large-grained kinds, is much greater than in the small-grained. An ear of Boughton would probably have as many grains as an ear of Clawson of one-third greater length. There would be, however, this difference in favor of the large-grained—admitting the number of grains in both kinds to be the same, on an average—that it would take about 700,000 small grains to make a bushel, and 550,000 to 600,000 large grains. Maj. Hallet, of England, claims that 450,000 grains of his pedigree wheat will make a bushel. The form of the ear and the number of grains in the spikelet, have much to do with the yield. A square-shaped ear with four to five grains to the spikelet, will yield more than a much longer pointed ear with three grains to the spikelet. A spikelet contains from five to six florets, of which one always—sometimes more—is barren. No spikelet, then, can contain at most more than five grains—oftener only three. It will be readily understood from this how it is that in California they obtain so much greater yields than we do, as the wheat there averages four and five grains to the spikelet, ours only two and three. Our wheat generally stands as thick on the ground as theirs.

Rust.

The great enemy of the wheat plant in this country is the rust, or mildew, as it is called in England. There is no year in which it is not more or less prevalent. I do not remember having ever seen a field of wheat in which, at the time of cutting, the plants had more than the top blades, the others having been eaten up by the rust. While it is true that the plant, to be perfect, should have all its blades turned a golden yellow from the ground up, still the loss of the blades does not appear to affect the size and plumpness of the kernels. It is only when the roots of the fungus penetrate the stem and intercept the flow of the sap to the ear that the grain loses its color and shrivels. The only certain way by which the effects of rust may be avoided is to sow a variety which will ripen early. In this climate, a sort which would be ready to cut by the 20th of June would generally be safe; one that ripened as late as the 1st of July would always be more or less injured. It is probable that ashes, or a mixture of ashes and salt, if applied in quantities sufficiently large, would have a tendency to prevent the ravages of rust. I have observed spots in fields, where brush heaps or a pile of stumps had been burnt, in which the straw was perfectly clean and bright, while all around it was perfectly black. When a field is first struck with what is commonly called "the black rust," the only thing to be done is to cut it immediately. A single night will ruin it utterly. This leads to a consideration of

The Plan of Cutting Wheat Green.

In Johnson's Encyclopedia we are given the details of an experiment practiced by Mr. John Hannam, of England, in 1840. This gentleman cut a sheaf from his field four weeks before the grain was ripe. He let this stand in the field two weeks, when he housed it, and on the same day cut another, which stood another fortnight, at which time the remainder of the field was cut, at the time when harvest usually begins. The straw of the first sheaf was perfectly green, and the grain, while plump, was full of milk; the straw of the second was of a hue approaching yellow, and the grain still juicy, but not so much so as the first; the last was cut when all signs of vivid health had disappeared. Samples of these were shown to a miller, who priced that cut green and the ripe sample at about the same, while he priced that cut in the raw state at two shillings per quarter more than either of the others. The difference in weight both of grain and straw was in favor of the raw over the ripe, and in weight of grain over the green also. I will say at once that while the plan of cutting in the raw state might do in England, it would not answer at all here, except in the case of rust, above mentioned. The grain of wheat in this country would be scarcely formed four weeks before it was ripe, and, if cut two weeks before being ripe, would shrivel badly. Wheat cannot be cut here more than three or four days before it is ripe. It will do to cut whenever, on taking a grain between the thumb and forefinger, it can be mashed without any milky juice exuding. I speak here from experience, as I have cut several crops in the green state, and they all shriveled. Our hot sun will dry up the straw in a single day, so that very little of its substance goes to the ear. It has, no doubt, been noticed by all observing farmers that the inside bundles of a shock always yield plumper and better grains than the caps and outside bundles. I have cut sheaves green, and carried them into the house to dry in the shade, and found that, while the grain lost its color, it shrank very little, if at all.

I reserve the consideration of the varieties of wheat and of the results of some of my experiments with the newer ones for another issue of this paper.

Pulaski Co., Va., July 10.

VARIETIES OF SUGAR BEETS.

E. R. BILLINGS.

The sugar beet is doubtless the most valuable product known for the manufacture of the finer grades of sugar. Canes, the Date, and our favorite forest tree, the Maple, abound in rich saccharine juices, but do not furnish so valuable an article as the vegetable known all over the world as the beet. While it does not yield as much sugar as the cane by about three per cent., the quality is much better, and in Germany, France and Belgium supersedes all kinds made from other sugar-producing plants. The manufacture of beet sugar has been confined until quite recently to the three nations named, but at the present time it is attracting very much attention in this country. In California a fine article of sugar has been made from the watermelon, but no great industry is likely to grow out of the experiment. The French and Germans have made the manufacture of beet sugar a complete success, and annually export large quantities to non-sugar-producing countries. The root is easily cultivated and is so rich in sugar that another great branch of industry in this country can hardly fail of success when once the process of manufacture is thoroughly understood. The beet requires rather light soil and must be well enriched with manure, since only large roots will give a fine grade of sugar. I propose to describe at some length some of the most popular varieties of the sugar beet, and shall only recommend those sorts that are cultivated by the best growers of both Europe and America.

Standing at the head of all varieties, as claimed by American growers (though not as yet by Europeans), is

Lane's Improved Sugar Beet

This variety is a greatly improved sort of the French sugar beet, obtained by very careful

selection in this country, and is recommended as being much hardier, more productive, and containing a greater percentage of sugar than the ordinary variety. It is an enormous cropper, and yields on rich soil from 10 to 20 per cent. more roots than any other variety known. This sort should be tested by all growers of sugar beets, and compared with

Vilmorin's Improved Sugar Beet.

This sort originated with Vilmorin, the great Parisian seedsman, and is a popular variety in France and Belgium. It is a good, strong grower, with light-green leaves, and forms a good-sized root on rich soil. Doubtless the imported seed is the best, as the seed is carefully selected from only well-ripened beets. In Maine this sort has been tested, and the yield of sugar has been satisfactory in every particular. The root is long, smooth and pure white, as are all varieties of the sugar beet. This sort has also been cultivated with complete success in Canada, and the sugar made therefrom has been pronounced equal to that made in Europe. It is one of the hardiest of all varieties, and succeeds well in all localities.

The White Sugar Beet

is also a favorite sort, attains a large size, and is excellent for feeding, as well as for sugar. It is largely cultivated in France, and is considered one of the best sorts cultivated.

One very important result is at length reached in sugar-making—its manufacture is no longer confined to tropical and semi-tropical lands, and the sugar beet is the only vegetable or plant that will succeed in the north temperate latitude, from which crystallizable sugar can be profitably obtained. In this respect it is superior to sorghum sirup, corn sirup, or glucose, all of which cannot yet by any known process be converted (at least profitably) into fine crystalized sugar. The beet is rich in sugar, of which it contains 15 per cent. (?) while cane contains 18 per cent., and maple sap only two per cent., so that it will readily be seen that the sugar percentage is very large, and is only exceeded by that in the cane, which latter product now supplies this country with nearly all kinds of sugar, both refined and unrefined. There are many other kinds of sugar beets known, more especially in certain localities of both Germany and France, but which have little reputation outside the limits of cultivation. The sorts described are worthy of culture both for sugar and stock feeding, and will yield abundantly when planted on rich soil and cultivated in the most thorough manner, as the beet should be in order to give the best results both to the grower and manufacturer of beet sugar.

Pomological.

RUSSIAN APPLES.

T. H. HOSKINS, M. D.

THE report in the RURAL, p. 438, of Mr. Barry's remarks on Russian Apples at the Cleveland convention, is not what any one could take exception to, yet it seems to me to be a very incomplete view of the subject. It is true, as I have myself noted in the RURAL, that very few of the several hundred kinds of Russian Apples imported by the Department of Agriculture, which have yet fruited, possess keeping qualities, or are of great merit as dessert fruit. But ought we to expect it? I understand that near St. Petersburg, in latitude 60° north, the Duchess of Oldenburgh is a winter Apple; while in northern Vermont (lat. 45° N.) it is an early fall fruit, and farther south it becomes a summer Apple. As grown in lower New England and southward, it is of medium size, with a "harsh, rasping acid" flavor. Here it grows so large, and of such a different general appearance, that Mr. Downing finds it hard to believe that we have it genuine; while the flavor, though not high or rich, is a very mild sub-acid when fully ripe.

Mr. Drew, writing in the RURAL (p. 422), from El Dorado, Cal., says, referring to Eastern apples growing there,—"Every section of the country, every locality, has a climate peculiar to itself, so it will be found that every clime will have its own peculiar kinds of fruits, which will attain the highest degree of perfection there only, and will lose some of their good qualities as soon as removed elsewhere. It is impossible to decide the varieties suitable for one clime by those that thrive in another. Early spring Eastern apples, for instance, become summer ones here, Eastern autumn apples change into winter, and of real winter or subsequent spring apples, we have very few."

Mr. S. B. Peck, on the same page, says of the Baldwin apple:—"The reputation of the Baldwin is derived, not from any fine flavor, but from the vigor and thriftiness of the tree, the fairness and fine appearance of the fruit, its good handling and keeping qualities; but, most of all, from its extraordinary productiveness, in which, as far as dollars and cents are concerned, it is doubtless superior to any other of the long-tested varieties. Such being the case, those who raise apples for profit, show good judgment in planting largely of this variety."

Now, this is just the view that I, in common with other fruit-growers in the "cold North," take of the Russian Apples. None of the great market apples of the country are of the highest quality for the dessert. The Red Astrachan, Maiden's Blush, Baldwin, R. I. Greening, Ben Davis and Pennock, all rank no higher that "very good," and some of them hardly rise to "good" in the pomological lists. The Duchess of Oldenburgh has to take the place of the Red Astrachan with us; for, though the latter is called a "Russian," it fails in the "cold belt." The Duchess, however, is not inferior to it in any of the elements of profit to the commercial orchardist.

It must be remembered, that but few comparatively of the new Russians have yet been fruited. Ten years are far too short a time to test them, sift them, and assign them each a place according to their merits. But I know of one, at least, that will rank with the best dessert apples in quality, besides being a beautiful and productive sort. I will not now name it, because experience has taught me that I shall receive a basketful of solicitations for cions which I am utterly unable to respond to. Others, besides Duchess, are already becoming known and valued, and have been described and figured in the RURAL. I do not think the Grand Sultan and Yellow Transparent (*perhaps* identical) can be easily beaten as very early dessert apples, or surpassed for health, hardiness and productiveness. But this must be understood only of them as grown far north. At Washington all the new Russians are pronounced worthless. I am told, and I feel sure that hardly one of them would do itself justice when grown even so far south as Rochester. They are essentially Apples for the far North; and late springs, a short season, and but little excessively hot weather, are all essential to the development of their good qualities.

Now, I think it no small gain for us to have a class of Apples, even though many of them are not of high quality, which allows orcharding to be extended several hundred miles farther north than has heretofore been thought practicable. I see no reason why the Russians may not be made to succeed all the way to the south shore of Hudson's Bay; and surely the possession of so good a fruit for use during the long winters of such a climate, will prove no small boon to the people who will eventually populate that territory. We, here in northern Vermont and the adjoining Province of Quebec, are delighted to get them, and we know so genial a man as Mr. Barry will appreciate the pleasure we find in an abundance of home-grown fruit, even though it may be somewhat inferior to that of his favored home.

SMALL TALK ON SMALL FRUITS.

BY MONMOUTH.

I ONCE heard of a man who paid two dollars for a pig, and, after feeding it eight dollars' worth of corn, sold it for five dollars. "True," said this embryo farmer, "I did not make very much on the corn, but then I made three dollars on the pig." After several years of this sort of *profitable* experience—although in many cases *I never received back as much as I paid for the plants*, to say nothing of the time, fertilizers and use of land expended upon them—I have come to the conclusion that it will not pay to plant for market any of the small fruits that are not hardy and prolific with berries of large size, handsome in appearance, and *sufficiently firm to ship well*. This is a pretty high standard, to be sure, and it cannot be expected that many of the candidates for public favor will come up to it. Is it not, therefore, perfectly natural that so few of the new, highly-extolled sorts meet the expectations of the fruit-growers? Another disappointment is sometimes caused by some one's offering

An Old Variety under a New Name.

This is, in most cases, brought about by innocent parties, I have no doubt. Some one on whose land the variety, whatever it may be, succeeds remarkably well, from lack of knowledge of the varieties cultivated, does not recognize the old friend, hence believes himself the happy discoverer of a chance seedling of wondrous merit. He therefore straightway gives it a name, and goes about propagating and advertising it in good faith. I have in mind a case in point. Sometime ago I heard considerable about the

Windsor Chief Strawberry

as possessing all the merits of a profitable variety to a degree beyond all others. I purchased two hundred plants, and by a fortunate coincidence planted them side by side with the Champion. On their coming into fruit, I must confess I have failed to find the slightest difference either in fruit or plant, and if any exists it must be slight indeed, after so thorough a scrutiny.

It is strange why so many omit to

Head Back the Raspberries and Blackberries,

when the operation is so trifling and the benefits so great. All that need be done is to go along the rows, and when the canes of Raspberries attain a hight of three to four feet, pinch out the top; do the same with Blackberries when four to five feet high, according to the variety. This will cause the plants to grow bushy and strong, and produce nearly or quite double the amount of fruit that they otherwise would; besides, it prevents the necessity of staking the plants the following spring, an operation requiring more than double the time, to say nothing of the stakes and hard words. Let those who have never done this, do it at once, and I am satisfied they will always do it in the future. It has long been known that strawberry plants set in the summer and early fall, produce better results than plants planted at any other season, but many who have tried it have become discouraged and given up the practice from the difficulty they experience in getting the plants to live at this hot season. This is effectually overcome by planting

Pot-grown Plants.

Several nurserymen are now growing plants in this manner quite extensively, to supply the demand, but it is not at all necessary for those who have plants already growing on their grounds to resort to the nurseryman. All that is needed is to procure small flower-pots—2¼ or 2½ inches across — fill them with earth and sink one even with the ground by the side of a young plant just forming. Press the young plant into the pot slightly and place a small stone or clod of earth upon it to hold it in place. In about two weeks it will be found to have grown into a good strong plant, and the pot will be filled with roots. Of course, it is better to remove the plants to their new house during a wet time, but should none occur they will do nearly or quite as well if the ball of earth and roots be dipped into water after having been removed from the pot and just before it is set into the ground, even though the weather be very dry. This plan is a vast step in advance of the old, uncertain one, and plants thus grown will produce, if well cared for, a full crop the following season.

Little Silver, N. J.

Horticultural.

SEEDLINGS.

Really more pleasure accrues from starting a new plant of worth than from any other branch of horticulture. Among the plants most easily experimented with are the Geraniums, Gladioli, Phloxes, Roses; indeed, any of the perennials or biennials afford an opportunity for improvements. Seedlings of Geraniums sown in a hot-bed can be brought to blossom the first year. Select seed from a bed in which have been grown several colors, and you are sure of something interesting, if it be not worthy of propagation. The Gladioli require a little more patience, needing about three years from seed to come to maturity. The same is true of the Hyacinth and the Tulip. Most bulbous roots take three to five years of care.

Any one having a small garden, should set apart one bed for experiments. Here may be planted extra-large seeds of fruits, or whatever draws the attention as peculiar. A few Grapes may be grown, while peach stones may be planted instead of being thrown away. Seedlings of Crawford's Early, and some other varieties, almost invariably produce good fruit; often better than the parent, and are often hardier. It rarely pays to expect apple seedlings to equal the best varieties now under culture. Better graft at once.

There are fruits as well as flowers capable of great improvement. This we may be certain of from observing the recent remarkable development of the wild Grapes, the Pear, the Potato, the Rose, the Dahlia, the Geranium, and the Strawberry. Among those deserving of experiments are the Persimmon, the Quince, the Blackberry, among fruits, and the improvement may be looked for in any direction among the flowers.

Accurate hybridizing is not so difficult, and is a very attractive style of experiment. It consists in simply removing the pollen from one flower or cluster of flowers, and dusting on the pollen collected from some other desirable variety. The bunch or flower must then be protected from the contact of the insects. The seed produced by this cluster or single flower will probably produce plants in which the two crossed varieties will combine their qualities. But hybridization is so largely engaged in through the agency of the wind and the bees that if several varieties of Grapes or Geraniums or Roses grow together, we have only to sow their seed to secure results similar to more artificial hybridization.

A pleasant supplement to the work suggested, is to name our choicest seedlings after our choicest friends. E. P. POWELL.

THE Fourth Annual Session and Exhibition of the Georgia State Horticultural Society, will be held in the Masonic Hall in the City of Macon, commencing Tuesday, July 29th, 1879, at 10 o'clock, A. M., and continuing during the 30th and 31st. Arrangements have been made with the railroads to carry goods for exhibition free and visitors at reduced rates, whom the Lanier House will entertain at the rate of $1.50 a day.

Industrial Topics.

THE FARMER'S WORKSHOP.

SERENO EDWARDS TODD.

EVERY tiller of the soil should provide a cheap and convenient shop, and a goodly number of mechanical tools, with which numerous little jobs may be performed in less time than would be consumed in simply going to and from the shop of a professional mechanic, who would necessarily require remuneration. More than this, farmers always have many hours and days, and sometimes entire weeks, of wet, stormy and lowery weather, when no one can work in the field. At such times, if one will exercise a little mechanical gumption when using mechanical tools, he will soon be able to perform almost any little job by way of repairing farm implements and hand tools. It is an old, but trite saying, that almost any one can do a difficult job if he have the necessary *tools*, while it will require all the skill of an expert mechanic to work *without* tools.

The first and most important consideration is the shop itself. If a man feels too poor to erect a commodious shop, and if he cannot occupy any part of some out-building, let him make an economical lean-to at the side of some building. Such a shop can be erected at the expense of only a few dollars. For example, let such a structure be about eleven feet broad by fourteen or sixteen feet in length. The sides and roof can be made of good hemlock boards, planed or not. At most lumber yards one can purchase hemlock flooring, matched and planed on one side, which costs only a dime more per hundred feet than the boards of the same quality not planed. Make a shed-roof, sloping all one way. Then cover the surface with newspapers or any other kind of paper, and spread over the paper old carpeting, old canvas, old matting, and cover thin pieces and holes with good pieces. Nail the edges and the pieces over the holes with carpet tacks, or with small lath nails. Such a roof need have only a slope of one foot in twelve. After the canvas or matting is securely nailed, apply a heavy coat of coal tar. Paper should be applied three or more thicknesses to keep the tar from running down between the roof boards.

Then, after the expiration of a few days, mingle coal tar, fine-sifted sand, and some sifted lime or gypsum, or Rosendale cement, or equal parts of each of these substances, until the mass is of the consistence of plastering mortar. With a plastering trowel, let a thin coat of the foregoing mixture be spread on the roofing foundation. One of my barns, a wagon shed and two corn-cribs are covered with such roofing, and they have been "leak-tight" for over three years. I procured a large quantity of the matting that comes around tea-chests, and the sacks which are made of gunning-cloth for holding coffee, peanuts and other commodities. A large quantity of floor matting and carpeting, not half worn out, was cast aside as worthless, which subserved an excellent purpose as a foundation for the roofing cement or plaster. The cost of such a roof is extremely small. The labor of putting the materials in their proper places constitutes the largest item of expense.

It will not be necessary to incur the expense of a framed building in the erection of such a workshop. Procure a load of hard-wood slabs at some saw-mill, and stand the lower ends on stones, or set them in the ground for posts and studs. Or cut down small trees, and straighten one side of the pieces for posts. If the ground is not dry, let a few wagon loads of clay, or gravel and clay, be spread over the surface. A plank floor is not necessary, for the reason that such a shop will usually be covered with chips, shavings and score-blocks. Two or three boards may be placed by the side of the work-bench, if deemed desirable. Of course three or four large windows will be essential, and a broad doorway of sufficient width to admit a wagon.

For myself, I would have a workshop built of as good materials and style as any out-building. But when a farmer feels too poor, I desire to aid him in erecting a workshop that will cost but little besides his own labor.

The attic story of many a building is of no practical use for any purpose. But by cutting a doorway at one end, making an inclined plane from the ground to the doorway, and putting three or four windows in the roof, a convenient workshop could be provided at a small expense. In many instances a portion of the basement story of the dwelling house could be appropriated to a workshop. A few

years ago, when I resided in Brooklyn, there was a sub-basement beneath our residence, which was about twenty feet wide by forty long. Several windows were inserted in the foundation wall, and a work-bench and tools were provided for the boys, who were attending school. Their parents never had occasion to request or command them to come home after school hours, or to keep out of bad company, or to shun places of public resort. No, never. That workshop and the tools seemed to have almost a bewitching influence. There were two saw-mills, a trip-hammer, and grist-mill and other machinery all in motion at once. Of course the machinery was of the rudest sort; yet the mechanical education and the self-training by way of handling mechanical tools, could not be computed in pecuniary value.

Entomological.

APHIDES OR PLANT-LICE.—No. 1.

PROFESSOR CYRUS THOMAS.

If closely and carefully studied, the plant-lice will be found to present not only some of the most difficult questions for science to solve, but also interesting facts pertaining to the entire insect class. Looking at them huddled in compact masses on a cabbage leaf or cherry twig, the observer sees at first, but little to attract attention or interest; in fact he sees but little difference between these minute creatures, no matter where he finds them. But first impressions in reference to natural objects are often erroneous.

The study of any group of insects will always repay in pleasure and interest all the trouble and labor necessary thereto; and the aphides are no exception to this rule. If the reader can take sufficient interest in such small things, I propose to give in two or three brief articles, a summary of the information obtained in reference to these insects, by a careful study of them for some years. And I may state as one of the results of this study, the conviction that their life-history is as yet but imperfectly known and that much that has been stated generally in reference to them, will have to be essentially modified. I have even serious doubts whether entomologists have yet ascertained positively the characters which distinguish the species from each other. The larger divisions of the family, as the sub-families and tribes or sections, are well marked, and the anatomical variations, as a rule, correspond with material differences in habits, which is a pretty sure test that the characters have been well chosen and that the divisions are natural. But in reference to species the case is quite different; while some appear to be well marked, others grade into each other so gradually that no real mark of distinction is to be found. In the days of Fabricius and the older entomologists, it was the custom to indicate the species, simply by noting the plant and part of the plant it infested; and notwithstanding modern entomologists have undertaken to define species with great minuteness, yet the species of plant they inhabit is probably, after all, their chief guide in reference to specific identity in cases of doubt where the knowledge of direct descent is wanting.

Some of the long-entertained opinions in reference to their biological history and habits will have to be abandoned, as more recent and careful investigations have shown them to be more or less erroneous. For example, their singular mode of reproduction has been stated both in entomological and popular works to be as follows: The female deposits eggs in autumn which, in the following spring, produce females only, which remain wingless; these are viviparous, producing living young without the intervention of the male; these are likewise all apterous females. This process is repeated during the season through some six or seven generations; but on the approach of winter a brood of winged males and females is produced; these females deposit the eggs which remain over the winter.

While this indicates generally their life-history, it is erroneous in several important particulars. In the first place, the method of reproduction is not uniform in the family, some being always oviparous, as the grape phylloxera and its allies; others continue the viviparous method of reproduction for two or three years; while a few, so far as known, never produce eggs, though doubtless this mode of reproduction occurs at long intervals. In the second place, the winged female is seldom oviparous. Buckton, the latest English authority on these insects, thinks it is never oviparous, but I am inclined to believe that a species found on the soft Maple, which I have recently described, forms an exception to this rule. In the third place, the males are of comparatively rare occurrence in most species, those which have heretofore been described as such being mostly winged viviparous females. In the fourth place, winged specimens occur in limited numbers, in the aerial species, throughout the season. In the fifth place, the facts recently ascertained render it probable that dimorphism occurs in a large number of species, enabling them in this way to pass the winter without the necessity of oviparous generation. This singular fact (which will hereafter be explained), if established, will go far toward explaining a part of their life-history, which has long been enshrouded in mystery.

I have stated that I doubt whether entomologists have ascertained the characters which distinguish species from each other. That widely separated species can readily be distinguished by well marked characters, is certainly true; but I refer to species of the same genus. It would require too much space to give my reasons for this opinion at this time. But I may call attention to the following points in reference to the characters which have been used to distinguish species.

Walker's method of characterizing them by the comparative distances of the veins of the wings from each other, will soon be abandoned as worthless by any one who attempts to follow it. Very marked variations may aid in connection with other characters. The color, which is now much relied upon, although quite uniform in some species, varies in others from almost uniform red to green throughout; from green to black, etc. While it is true that those which feed upon native uncultivated plants are usually confined to a single species or genus; on the other hand, those found on cultivated species sometimes have a wide range of food plants.

These and numerous other facts which might be mentioned, render it possible, at least, that some of these differences which are now considered specific are owing to differences in food plants. Failure in attempts to colonize on different species of plants is not satisfactory proof to the contrary, unless carried step by step through the nearest allies.

I should have stated above that some species produce but one brood in a season.

Lest I make this article too long, and weary the reader, I will close with the description of a new species found on the tomato; a species so well marked that it can readily be identified.

Megoura solani—New species.

Winged viviparous female.—Antennæ seven-jointed, a little longer than the body; third and seventh about equal, longest; sixth about half or less than half the length of the fifth; the tubercles on which these organs are placed and also the first or basal joint, gibbous internally. The honey-tubes extending beyond the tip of the abdomen; excessively enlarged in the middle, expanding at the immediate tips in trumpet shape. Tail of moderate length, about one-third the length of the honey-tubes, conical. Wings of the usual form in Siphonophora; second fork of the third vein about equally distant from the apex and third vein; stigma elongate, slender and pointed. Size rather large. General color green; tail greenish-yellow at the base, darker at the tip; legs pale; head, dark; prothorax, pale; disk of the thorax, dark.

It does not appear to be the habit of the insects of this species to collect in colonies; but, so far as they were observed, they were found scattered singly over the leaves and stems of the plant. Their feet were clogged with the viscous fluid which exudes from the plant, giving them the appearance of being club-footed. Their evident acquaintance with the tomato plant, as shown by the method in which they pass over the minute, sharp hairs with which the stems are covered, is a strong evidence that they are at home on it.

Various.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

A Fair Joke.

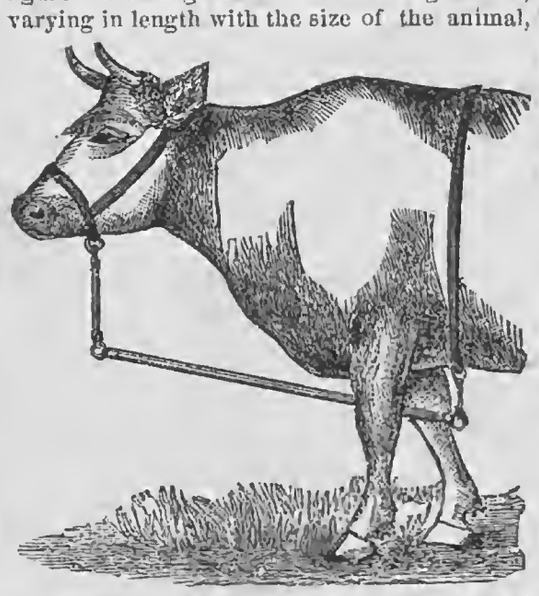
Our Dorkings breed more single combs than double ones. This leads us to believe that single combs are the most natural. Last season, at the county fair, the judges on poultry were selected as experts, and when they went around to award the premiums, they ruled out our old trio of Dorkings as not up to the standard, because they all happened to have single combs, and awarded all the prizes to those with double combs. Every one of these were the chickens of those very same fowls!

We Want More Flowering Shrubs.

Farmers would have more flowers about their homes if there was not so much labor connected with them. It took us a half day to weed out the petunia bed, and while we were at work it occurred to us how much easier it would be to cultivate flowering shrubs. They could be tastefully set about the door-yards and lawns and in the gardens, and very little labor would be necessary to keep them in order. Strong-growing plants, like Peonies and Hollyhocks, are not much trouble and are beautiful in their time. Perennial plants are what farmers want the most. These can be set along the walks and in clumps, and one or two dressings during the summer will protect them from weeds and grass and keep them in thriving order. If the Rural will give its readers a list of hardy perennial plants and flowering shrubs, including Roses, which will bloom during the entire summer in their order, we are certain the favor will be appreciated, and discouraged flower-growers will start anew. For the autumn we must have the Asters, Phlox and Zinnias, but they are not so much bother as many others, and their beauty will pay for the extra care. This might be said of all flowers, if one only had the time to spare. Some flowers we must have, and if we cannot adorn our homes with the pretty annuals, then we will make them as cheerful and attractive as possible with the shrubs. [Col. Curtis's suggestion is fully acted upon in the Rural's free seed distribution.—Eds.]

PREVENTIVE FOR SELF-MILKING.

Some cows have the disagreeable habit of milking themselves, which, however, they may be broken of by dressing them for a time in the simple attire shown in the accompanying figure. A strong stick of some tough wood, varying in length with the size of the animal,



is suspended between the fore legs, one end being attached to a surcingle buckled about the body, and the other fastened to a strap which is buckled to the halter. The strap that unites the stick with the halter should be at least twelve inches long; this will allow the necessary movement of the head to graze freely, while it still prevents the cow from bringing the head to the udder.

BOOKS, PAMPHLETS AND CATALOGUES.

Something New.—We write this notice with a *Stylographic Pen*, so-called, but which is really not a pen at all, but a metal point combined with a tubular holder filled with ink, in such a way that when the point is pressed lightly on the paper the ink flows, leaving a line of uniform width. It might be called a pencil that writes with ink, that never needs sharpening and never wears out. We have used Fountain Pens of different styles for the past fifteen years. Some were pretty good and some were good for nothing, but we think this new invention is likely to supersede them all. For those who write much or little it will be found cleanly, convenient and always ready. We will not undertake to name all its good points, but readers will find them in a circular they can obtain from C. W. Robinson, 169 Broadway, New York, on application by letter or otherwise.

NEW YORK STATE FARMERS' ALLIANCE.

The annual meeting of the New York State Farmers' Alliance will be held in Syracuse on the third Wednesday of August. It is important that all localities and every grange, farmers' club or other agricultural organization be represented. To this end delegates should be appointed at an early meeting of every local organization, at the rate of three delegates for each 100 members, each grange, club, etc., being entitled to at least one. Due notice of the meeting will be sent to officers of all societies so far as known. Granges, alliances and clubs not receiving any notice are requested to send names of officers and their P. O. addresses to the secretary. Harris Lewis, Pres't,
Frankfort, N. Y.
Ww. J. Fowler, Sec'y, Pittsford, N. Y.

Is Lawson Cypress Hardy at Boston?—It is not. In the punctuation, p. 408, had a comma instead of a period been placed after "Lawson Cypresses," the sense of the sentence would have been as I intended it. A Visitor.

Industrial Implements.

THE ONEIDA ENGINE.

The Oneida Iron Works have large facilities which are devoted exclusively to the manufacture of steam engines. Several styles, besides the agricultural, are made; but it is with this that we are more particularly concerned. Those who have used it, in connection with separators, speak highly of its economy of fuel and excellent service.

Not alone thrashermen, but farmers are rapidly becoming conversant with the advantages of steam, as may be shown by the large sales during the past few years. It is only a question of a few years when it will be the exception to find an agriculturist who sets his face against steam on the farm. The Rural has given extended attention to this subject, and has chosen examples of the leading styles. In this issue we present the "Oneida," made by the firm above named, at Oneida, N. Y. The most important feature in any engine is the boiler, and for this one the following good points are claimed: The fire-box is of large size and curved form, its under side forming the ash-pan, which allows a constant circulation of water under the grates, preventing sediment from adhering to the sides. Nothing but the best quality of American charcoal hammered iron is used, and care is taken in laying them out to see that the rivet-holes are accurately punched. The tube-sheets are of half-inch iron, which insures long wearing qualities in a part of the construction which is apt to give way the soonest.

The smoke-box is formed by the extension of the boiler shell, and being of boiler iron is not liable to rust off. A hinged smoke-stack, improved spark arrester, thoroughly constructed engines, and substantial running gear complete a steam engine that is graceful in design, strong, serviceable and economical to operate. Circulars may be had on application.

The Heath String Binder, made by The Johnston Harvester Co., of Brockport, N. Y., was recently submitted to a thorough test in the presence of our representative, at Brockport. The wheat, though well filled, was short—a condition making it unusually difficult to form a good bundle. Notwithstanding this fact, the binder worked to perfection, throwing off the bundles well-bound, and in good shape. The size of the bundles is gauged by a foot lever, which is at all times under the control of the driver. The machine is light, well constructed and easily handled. Next season the binder will be placed upon the market, and it would seem to be an event decided in advance that the sales will be large.

Everywhere.

WESTERN AGRICULTURE.

YEARS ago it was thought that to possess a section or half section of the fertile prairie land of Illinois, and enough teams to break it up and plant the same to corn, and in time to gather the large harvest which it yielded, was fulfilling the requirements of a practical farmer. Now that it has been shown that, as regards the fertility, our Western soil is like the soil in other localities, sure to run down without proper attention, the farmers are beginning to open their eyes and to believe the fact that agriculture is a science. Too much land, too little capital, and an inadequate understanding of the science of farming, have all tended to make Western agriculture of late years an unprofitable occupation.

One after another of the large tracts of land which were heretofore run as separate farms, are being divided up and sold in small pieces to suit purchasers; and I cannot help but feel that this is a step in the right direction, as it will induce people to make homes on the lands which before were only rented out, or on which there were no houses except for hired hands.

Now that the questions of manuring and tile-draining our lands have been brought before our people, we look for decided improvements in the agricultural districts, and when once we are awake to the real necessities of manure and drainage, there can be no doubt as to the results. On the farms and in the small towns of Illinois thousands of loads of manure remain unused every year, which would add materially to the productiveness of the land, if only hauled out and utilized by our farmers, who, at present, need to use every means in their power to help bring about a change from the hard times under which we have been laboring for several years past. To this same end it is necessary for us to better understand our calling, and practice only those rules which our own experience and the experience of others show us are successful ones. We have every advantage that could be desired as to markets for stock, produce and grain, and now the questions that most interest us are: How to keep up and improve the fertility of our farms; what kinds of grain to grow; what breeds of stock to keep, and what percentage of our crops should be fed on the farms and what proportion should be sent to market.

In some parts of the West dairy farming is very popular, and carried on successfully; but as yet this mode of farming is in its infancy over the greater portion of the Western territory, while the raising of grain for market is the general occupation of our agriculturists. A tendency to mixed husbandry and the raising and feeding of stock is getting to be quite popular in localities where simple grain farming does not pay. Another step forward is the increasing attention given to the producing of fruits and vegetables for home and foreign markets, and to-day some of the fruit farms of the West rank among the very best and most successful in the country. There is no reason why this should not be, for the climate and soil both favor the more hardy fruits; while there are many localities in which Peaches and other more tender fruits are produced in abundance.

Although borrowed capital has done a great deal towards building up the West, still just now we have come to the paying time, and general depression is the result. Thousands of farms are changing hands; but in so doing the mortgages are generally lifted and the land left free of incumbrance, which is, of course, a good step toward better times. In spite of all reverses, there is a bright future for Western agriculturists who apply themselves to their calling, and are in earnest in their endeavors to carve from the Western prairies homes for themselves and families.

Champaign, Ill., March 1st, 1879. L. L. D.

PENCILINGS BEYOND THE MISSISSIPPI.

A FEW short years ago and how far off seemed the land beyond the "Father of Waters." We read of the broad prairies, the noble forests, and the fertile bottom lands of Iowa, Missouri, and Kansas, and imagined that we should never behold them save in imagination. But the iron ribbons which cross the States in all directions, have paved the road to the settling of still more distant territories, and the cry of "Westward, ho!" has reached the most western range of the Cordilleras; nor stopped until it dipped with the setting sun in the peaceful bosom of the ocean. Ten years ago my father, moved by the resistless spirit of change, followed the advice of the lamented Greeley and "came West." An old man then, the snows of sixty winters had thinned and whitened his locks, but had failed to quench the ardor of his ambition; and the spring of 1869 found him settled for the remainder of his days upon a farm in the woods. The improvement on it consisted of an old frame house, minus doors and windows, and surrounded by a rail fence inclosing about half an acre. A few stunted Morello cherry trees, and half a dozen prickly gooseberry bushes completed the prospect. It would take months to relate the various discouragements and privations incident to life on a new farm, which we endured for five or six years; at the end of that time we began to discern something like order in the midst of chaos. Now, the greatest difficulty is in finding a non-resident tenant. Nearly every man here who owns a team and does not own land, will decline to work land on which the owner lives. They want full control of everything, and are mad if they can't get their own way.

And right here, I will add a word of advice to those who have the "Western fever." If you have reached the meridian of life, and have a comfortable home in an Eastern State, with assurance of a sufficiency during life, *don't come West*, at least to Missouri. Stay where you are, and let the younger men "go West" and advance with the country through competency to affluence. Old people have fixed habits and opinions; and the breaking up of old ties, old associations, and the change of fare and the unaccustomed labor, cannot but have a depressing influence upon their spirits, and eventually upon their health. The knowledge that we are in sympathy with and are an *acceptable* part of the community in which we live, has a decided effect upon the health and happiness of an individual; and no matter how loudly the Western newspapers cry to the contrary, it is an undisputable fact that the majority of Missourians do not desire the settlement of Eastern families among them. Those having the courage to come are preyed upon in every possible manner. * * * *

Is it any wonder that the best teachers in the State are leaving for other States, when we consider how the rights of the people to say how many months' school they shall have their districts taxed for, is taken from them; and in about four-fifths of the schools the directors will manage to have only just enough school to secure the public money. You do not need to be told what kind of school directors run those delectable districts. Having school only one-third of the time, where are the youths the remaining two-thirds? They are "sitting around" at home, while those large enough have gone to town and may be found in the saloons and playing cards. The smaller boys are playing with the dogs, of which each family possesses from three to a dozen, according to their ability for eluding the assessor. The consequence is that when these boys become men, they are about as fitly qualified to vote as are their fathers. The State cannot afford an appropriation of ten thousand dollars a year for the support of a Normal School, but it can pay several times that amount for the support of paupers and convicted criminals. It is not surprising then that the trains of emigrant wagons which we see daily traveling westward, should pass on to some better governed and more intelligent community. I do not wish to be understood that there are *no residents* who are intelligent, educated, and refined, for there are many from Ohio, Pennsylvania, and New York, who constitute as truly refined a society as any I ever met at the East; but this class of people is generally to be found in towns. In the country they are yet in the minority, though in a silent way their influence is felt. On every side we hear the remark, "I'm here and can't get away." They have invested all their available means in land, which will not now sell for half its cost, and too late, they find they have bought an elephant. Others who are young and hopeful, leave these scenes for more inviting fields of labor.

Sublette Co., Mo. BESSIE VICTOR.

RURAL SPECIAL REPORTS.

ME., East Orrington, Penobscot Co., July 15.—We had a cold, backward spring. Plenty of rain the last of May and first of June has given us a bountiful hay crop. Wheat is looking well. Corn promises to be a light crop. Potatoes are looking fine. Fruit trees were white with blossoms, but our crop will be light, owing to the late frosts. Potato bugs are putting in an appearance quite thickly. H. E. S.

N. Y., Croton, Delaware Co., July 16.—The recent rains have much improved the prospects of the hay crop hereabouts, and it will, doubtless, be fully an average one.

E. J. B.

N. J., Bricksburg, Ocean Co., July 11.—Our heated spell culminated on July 4th, when the thermometer marked almost 100 degrees on the north side of the house. Toward midnight of that date rain fell lightly, which had the effect of cooling the atmosphere almost to chilliness. Since then it has remained cool until to-day, when the thermometer again touched 92 degrees. Most crops are badly wilted from lack of moisture. Corn is looking well; a few blackberries are ripe, and early cabbage is fit for market. All fruit trees, except Pears, are fairly full and promise well. Haying is all finished and the crop is in the barn in good condition. Wages are $1 without board, and $10@$15 per month when boarded.

G. A. M'B.

NEW JERSEY, Brookside, Morris Co., July 10.—Wheat and rye are almost a failure; corn, oats, hay and potatoes are all good. J. D. T.

MINN, Litchfield, Meeker Co., July 8.—Crop prospects continue good. Local storms, however, have done some injury and reports and fears of rust are about; but that's all. Wheat is headed finely. Some fields of oats will be ready to cut in ten days. New potatoes have been in market for two weeks and ripe currants are in abundance. We have had plenty of rain, and the ground is in fine condition.

G. M. F.

MINN., Cedar Mills, Meeker Co., July 12.—We have been having very heavy rains during the past week, and some fields of wheat are troubled with rust. N. B.

MINN., Marshall, Lyon Co., July 10.—Crops are looking fair, and our prospects are good at present. S. W.

IOWA, Bloomfield, Davis Co., June 30.—Early last spring one of the proprietors of a local newspaper gave me one small "Beauty of Hebron" potato. It had seven eyes. I cut it into seven pieces (an eye to the piece) and planted each piece in a hill on the 18th of April. Yesterday I opened some of the hills and took out only one potato (I want to save them all for seed, and did not disturb the hills much); it measured 7¼x11¼ inches in circumference. They are the finest-looking potatoes I have ever seen. J. P. F.

KAN., McPherson, McPherson Co., July 10.—Wheat in this county will be a fair crop, with an estimated yield of 1,800,000 bushels. It is all harvested. Recent rains have insured the oat crop. The prospect for corn is exceedingly good. Potatoes will be a full crop. L. & G.

OREGON, Umatilla, Umatilla Co., July 3.—This is mainly a stock-raising country. Grain is grown only along the streams on the "bottoms;" but where they are sown, the wheat, oats, barley and rye have a heavy growth and promise an abundant harvest. Vegetables of all kinds are doing well now, but are late, owing to wet weather in May. The cultivation of fruit has not been properly attended to in this immediate vicinity: but wherever a show has been given them, all kinds of fruit are looking fine. C. W.

WASH. TERRITORY, Pine Creek, Whitman Co., July 2.—Wheat, corn, potatoes and fruit are looking very fine. I never saw them look better. This is a newly-settled part of the country, however, and there isn't much corn or fruit raised here yet. N. B. P.

CAL., Soquel, Santa Cruz Co., July 8.—Wheat and barley are very good crops, and are already being harvested. Corn never looked better than at this time of the year. Early potatoes are abundant and very cheap. Fruits of all kinds bid fair to be all that we wish. Strawberries have been almost a drug in the market; the second crop is now coming in. Blackberries, also, are abundant. Grapes are looking fine. Our climate can't be beat. There is a beet sugar manufactory in Soquel, and beets are looking fine. Sugar-making begins in August. C. H. H.

TENN., Somerville, Fayette Co.—The seeds sent me by the RURAL are all doing well. My friends laugh at me when I tell them I am going to compete for one of the premiums on Blunt's corn. They say no Southerner can get it; but I tell them that if I don't get one it will be because I don't deserve it. The RURAL deals so honestly, even in its opinions on advertisements, that its candor has given me confidence in what it says. Of the seed sent I did not plant 16 grains, as mice had eaten out the hearts of them; 100 grains germinated; two were cut down by cutworms. I hope to get the $100, as the corn is now looking nice, and my neighbors don't laugh so much at my expectations. G. W. B.

[The premiums will be awarded according to merit. We have no sectional prejudices, and, if we had, should feel ashamed if they influenced us in the distribution of our premiums.—EDS.]

NORTH CAROLINA, Chapel Hill, Orange Co., July 14.—We have had a short season of intensely hot and dry weather. The early rains made a sharp contest between the grass and the farmer, but the showers failed as the heat increased. In the last of June and first of July the weather was so dry that all growing crops were injured. The early corn has suffered very seriously, and the cotton and tobacco may not recover from the ill effects. Strong winds, often from the east, have had a very hurtful influence. But the clouds are more propitious now. There are signs of general rains and plenty of them. My philosophy in dry times is to incessantly expect that it is going to rain. I recommend this to all RURAL readers. It keeps up the spirits and encourages one's friends. There is no need of being disappointed, as you may move your prophecies and expectations forward every time a mistake is discovered. This is far better than the opposite course. For example, a venerable and intelligent gentleman, living in my county argues that we shall have a famine this year. He is very positive in his opinion, but I have heard no argument from him except that "there was pestilence last year, and there will be famine this." I hope these rains will wash away his gloomy theory. Our fruit crop is very short, and has shared in the damage done by the hot weather. In your crop-report number I was probably incorrect in reporting a reduced acreage in cotton. Probably the State has more than last year. I am still well pleased with the Beauty of Hebron potato. It is perhaps two weeks earlier than any of the more common early varieties—has good qualities every way, except that it is not very prolific. There is a discouraging tendency in the dwarf pear trees to die from what seems to be sap blight. So far I find that pruning off the dying limbs arrests the decay. My *guess* as to sap-blight is that it is caused by very cold weather after the sap has started in the spring. The contraction upon the more exposed or tender parts acts as a ligature on the circulation. I tried pear grafts on the Pyrus Japonica, but failed completely. I have not yet been able to get either Pear or Apple to live on the hardy little stock. A. W. M.

N. C., Brookston, Warren Co., July 14.—Since my last report we have had a drought. Though cotton and tobacco, where well worked, have suffered but little, corn, gardens, clover, etc., are pretty well dried up, while trees and vines planted this spring have suffered severely. We now feel encouraged to believe the dry spell is broken; a gentle rain is now falling, and vegetation looks brighter. Wheat is all thrashed—about an average yield and of better quality than last year. Prices of produce are: wheat, $1; corn, 80c.; butter, 15c. to 25c.; eggs, 12½c. Grapes (Ives's) beginning to color. M. B. C.

FLA., Tallahassee, July 11.—Owing to a three weeks' drought, our corn crop will fall off at least one-third from last year's yield; fortunately, there is plenty of old corn in the country, and selling at 45@50c. The past five days have been the hottest of the season, and the thermometer yesterday at 3 P. M. indicated 92°. This hot, dry weather is no detriment to cotton, which is putting on fruit finely, and is all we could wish it to be. The RURAL is read with interest by many here, and may its days be long in the land. The orange crop has been injured by the drought, and, I fear, will be small and inferior. Figs, now fully ripe, are delicious, and watermelons of 30 pounds are slow sale at 12½c. A SUBSCRIBER.

TEXAS, Refugio, Refugio Co., July 7.—The prospects for corn, potatoes and fruit in this section are very poor. Corn is an entire failure with some people in some localities, while others planted in season to receive the partial rains, and they will be rewarded for their efforts. There have been no experiments with wheat so far to the southwest as this. M. P.

The Querist.

ANSWERS TO CORRESPONDENTS

Improving a worn-out Orchard; Blind Staggers in Sheep, etc.

A. A. C., Hardinsburg, Ind., asks how to fertilize a worn-out, gravelly orchard on a yellow clay hill; 2, when is the best time to sow orchard-grass. 3. His sheep suffer from something like blind staggers, and he asks the cause and a remedy; 4, also whether the old or the young bees leave the hive in swarming; and, 5, can old bees make comb.

ANS.—1. This is a difficult problem to solve. If farmers would only prevent their land from being worn-out, by using the simple preservative methods of growing clover, using plaster and lime, and plowing under clover-sod at least once in four or five years, such requests as this would never need to be made. When land is worn out, nothing can restore it but manure or costly labor and time. It is the fable of the killing of the goose to get the golden eggs, repeated. In this case it might be well to plow the ground and sow a bushel and a half of buckwheat per acre. If any wood ashes can be procured, or a bushel of plaster per acre, we would sow it on the seeded ground. In September, the buckwheat will be in blossom. Then we would hitch a chain to the double-tree and the plow-beam, and with the loop dragging in the furrow, plow and turn under the buckwheat and leave the ground until the spring; then cross-plow and sow half a bushel of buckwheat per acre in May, and with it one peck of clover seed per acre. The clover will probably "take," and as soon as the buckwheat is ripe it should be cut, leaving a high stubble, which will still protect the clover. The clover should be permitted to fall on the ground and the next year should be plowed under and the whole process repeated; harvesting the buckwheat, however. The next crop of clover may be cut for hay or pastured. After that orchard-grass seed may be sown. 2. Either May or August is a good

season for doing this, as may be convenient—and the orchard would be benefited by being kept as a pasture. 3. Blind staggers, or a dull, stupid condition, with staggering and turning round and round, is indicative of indigestion; perhaps from want of regular salting or eating coarse weeds. Sheep will eat weeds when they can get nothing else, just as "the man filled his belly with the husks that the swine did eat;" but neither is wholesome food. Give the sheep a teacupful of linseed oil each; put them on a good clover lot and give them a handful of bran a day. The reaction may cause diarrhea and that should be looked for. If it appears, give each sheep a tablespoonful of prepared chalk, and a teaspoonful of ground ginger in a teacupful of peppermint tea. Salt should be left in a box in the pasture for the sheep to lick when they want. 4. The old bees are the ones that swarm out in quest of a new habitation, and some of the younger bees too, though as a general thing a majority of the latter remain in the hive. 5. Yes, old bees can build comb, as we have ascertained by experiment. A colony that had been without a queen for some time, and consequently had but few young bees, was confined for eight days in an empty hive, no frame having even a piece of foundation, and fed on a sirup prepared for the purpose, when quite a quantity of beautiful, white, translusecnt comb was built. In the economy of the hive, under normal circumstances, the young bees build the comb and store the honey and pollen, which the old bees collect. Since the old bees swarm and build comb in a new place, this is proof enough that they can build comb.

How to Raise Onion Sets from Seed.

R. M. B., Almond, N. Y., asks us to inform him of the method of raising onion sets from seed, at what time to sow the seed, and how to preserve the sets, etc.

Ans.—As early in the spring as the ground is fit to work, prepare a piece of poor land for the seed-bed, by plowing, harrowing and leveling. No manure should be added as the object is to grow the sets small, those ranging between the sizes of a pea and an acorn being the best. When the land is prepared, drill the seed in thickly in rows one foot apart. During the summer, the sets should have cultivation enough to keep the weeds down, but nothing more. In August they will be ready to take up. When well dried, they should be removed to a barn loft or some similar place, the tops adhering, and here spread out some five or six inches thick. On the approach of cold weather they must be covered with hay or straw to protect them against the frost. If they are spread on a loft over a warm stable, there will be no danger of frost from beneath, otherwise a layer of hay should first be spread on the loft, this covered with canvas to prevent their being lost in the hay, and the sets laid on the canvas. A little frost will do no harm. Early next spring they are again planted in rows a foot apart and three inches between the sets, this time in rich land, as the larger they now grow, the better. The best way is to plant them by hand, pressing each bulb down firmly and taking care that the top points upward. The crop will be ready for market by the end of June.

Vinegar from Grape Pomace.

W. W. W., Atlanta, Ga., asks—1st, how to make vinegar from the pomace of grapes after the wine has been pressed out; 3d, what grape is best for making raisins?

Ans.—1. Grape pomace is not counted of much value for making vinegar—at least when apples and cider are cheap. The argol or tartaric acid it contains is not as good for vinegar as the malic acid of the apple; still, a fair article of vinegar can be made from it in the following manner: Break up the pomace finely, and make a firm pile of it on a floor or in a vat, adding a little warm water, as the pile is increased—as much as it will hold without draining out. Let it lie and ferment for several days, or as much as it will without musting; then press out, and if the liquid seems weak add grape sugar (glucose); it is cheaper and much better for the purpose than cane sugar or molasses. Then let it stand in open casks or vats, in the summer air, or in a warm place, to ripen. 2d. None of our American grapes are suitable for making raisins. All are too juicy. Several of the European sorts having firm or "meaty" texture, are used for the purpose in foreign countries and in California, especially the Malaga, the Muscatel, or "sun raisins," which, unlike most kinds, do not drop from the vines when ripe.

Insects for Name.

N. C., Berlin, Conn., sends specimens of insects, whose *specific names* he requests us to mention, as the family group to which they may belong is less difficult to determine.

Ans.—The flies which are sent belong mostly to a family of those which feed in decaying vegetable matter; as might be suspected from the tenor of the statement accompanying them. They have been very little studied in their winged state, and perhaps still less in their earlier stages, so that a request for their "specific names" cannot easily be complied with at all. At the risk, therefore, of seeming to give just the answers which are deprecated, we take up our correspondent's queries in order. "No 170" belongs to the genus Nycetophila; No. 174 to Sciara; bottle No. 181 contained at least two species of larvæ, one of which may be a Sciara, but the other seems very different, and is not known to us at all. No. 182 refers again to larvæ and flies which seem to be Sciara, and No. 189 to pupæ which we cannot identify. No. 185 can be identified as Stictocephala, *var*—Say. No. 193 is a species of Anthomyia. Specimens of flies cannot be preserved in liquid in such a way as to make them available for study in connection with published descriptions.

Tawney Oats and Challenge Australian Wheat.

A Subscriber, Greensboro, N. C., asks what is the reputation S. G. Staines & Co., seedsman of Philadelphia, and whether anything is known to us of the above grains which they strongly recommend by circulars.

Ans.—We sent our reporter to Philadelphia to make the necessary inquiries concerning this firm. It was impossible to find any representative of the firm. A small room does duty as an office and it seems to be locked most of the time. There is nothing to indicate that a business of any kind is carried on, and every thing points to the conclusion that it would be as well to have no dealings with the parties. The oats and wheat are unknown to us, and are, in all probability, old, well-known varieties under new names. We are always ready to investigate anything of doubtful character in the interests of our subscribers, and if we were notified in every instance before purchasing, many dollars would be saved to our readers, and many "humbugs" would be shorn of most of their opportunities for evil.

Bloody Milk.

J. B., Union, Broome Co., N. Y., writes that he has a cow which gives bloody milk from two teats at the last of each milking. She has been given about a teaspoonful of saltpeter at a time every morning for eight or ten days; she has had poke root about the same number of times and also condition powders but seems to get no better, and he asks the cause and a remedy.

Ans.—Bloody milk is the result of congestion or inflammation of the udder, and this may be caused in a variety of ways:—by blows, irritating plants in the food, rheumatism, by heat or rut, by a sudden increase of the ration with rich food, or a considerable augmentation of the flow of blood to the part, as happens at calving. We would advise a purgative consisting of one pound of Epsom or Glauber salts, to be followed, after the effects have subsided, by one ounce of saltpeter and twenty drops of tincture of aconite twice a day for four or five days. If there are hard lumps found in the udder, the part should be bathed with tincture of camphor or with a mixture made by adding one part compound tincture of iodine to four or five parts of water.

Ammonia Salts.

W. V. F., Delmont, Pa., asks, 1, where he can obtain the ammonia salts referred to in Mr. Lawes's address on farming, published in the RURAL of June 14; 2, when to apply it to land—after wheat has been sown on it, or just before; 3, what is the price of ammonia salts by the 100 pounds.

Ans.—1, Of any of the firms that advertise commercial fertilizers in the RURAL and similar journals. 2, That depends; sulphate of ammonia is preferable for winter wheat, and if the seed is drilled, the fertilizer should be drilled in with it, whereas, if the former is sown, the latter should be applied just before the sowing. Nitrate of soda is most effective as a top-dressing in spring. Both these fertilizers should be used with care. A more even distribution may be secured by mixing them with coal ashes, dry earth, gypsum or even sand, according to the nature of the soil. 3, Nitrate of soda is worth about four cents a pound in small quantities; sulphate of ammonia, about five cents; dried blood, about three cents.

The Rural Grounds and Farm.

L. M. C., Erie, Pa., asks why we write from both the "Rural Farm" and "Rural Grounds;" why not write them under the head of "Rural Experiment Grounds?"

Ans.—The "Rural Grounds" consist of a fraction over two acres. Here all sorts of evergreen and deciduous shrubs and trees, as well as hardy herbaceous perennials, Grapes, all small fruits and vegetables are tested. At the "Rural Farm," which embraces 80 acres, only farm crops, manures, &c., are tested. The two places are 40 miles apart—the former being in Bergen Co., N. J., and the latter in Queens Co., Long Island, N. Y.

Catalonian Jasmine.

Mrs. A. W., South Reading, Vt., wants to know how the Catalonian Jasmine should be treated, and how old a Cyclamen must be before it will blossom, and if it blossoms more than once.

Ans.—The Catalonian Jasmine, otherwise Jasminum grandiflorum, is a lovely shrub from East India. It is hardy in the Gulf States, but in the North it must be grown in the greenhouse. It thrives best in a soil composed of equal parts of loam from decayed sod, and leaf-mold, with a little manure and some sand well mixed together. The pot should be of but moderate size and well supplied with drainage. The slender branches should be tied to a trellis erected in the pot. The Cyclamen blooms in the third year from the seed, and continues to bloom for many years.

Miscellaneous.

S. C. C., Lewis Co., N. Y., asks where can he get a sorrel tree, and whether it has any other name.

Ans.—Of Ellwanger and Barry or Frost & Co., Rochester N. Y., or Parsons' Company, Flushing, Long Island. It is also known as Sour-wood, and its botanical name is Oxydendrum arboreum.

H. K. J., Westchester Co., N. Y., asks our advice as to "pot-grown" Strawberries, and where he can purchase them.

Ans.—If properly grown and transplanted, and planted now or later, they will produce nearly as large a crop next summer as if planted last spring. F. R. Pierson, Tarrytown, N. Y. E. P. Roe, Cornwall-on-Hudson, N. Y.

J. D. T., Brookside N. J., asks where can he get a good, cheap, durable miter-box for cutting moldings for picture frames.

Ans.—The Langdon Miter-Box Co., of Miller's Falls, Mass, make a metal box that is said to be the best.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JULY 19th.

WHAT OTHERS SAY.

ENGLISH AND AMERICAN FARMING.—A recent number of the London Economist gives an interesting, and, as it would seem, very careful comparison between farming in England and farming in America. In England one acre yields on an average thirty bushels of wheat, while in America it yields on an average only thirteen. The American farmer must, consequently, cultivate two and a half acres in order to produce the same quantity of wheat as the English farmer raises on one acre. How is it, then, the paper asks, that the American farmer can, nevertheless, not only compete with the English farmer, but even beat him in his own market? The answer which first presents itself to this question is the enormous difference of rent in England and America; but this difference is, as the paper shows, nearly if not altogether, obliterated by the cost of transportation from the western fields to the English market. The real advantage which the American farmer has over the English lies in the cheapness of cultivation. In the settlements along the Red river, in Northern Minnesota, a plow may be run through the soft alluvial soil for more than fifty miles in a straight line without encountering a stone, a tree or a hill, a feature to which England does not offer the faintest approach.

INFLUENCE OF THE TIME OF CALVING ON THE YIELD OF MILK.—A note on this subject, from the pen of an experienced Dutch agriculturist, appears in the columns of *Biedermann's Centralblatt*. In Northern Germany it is generally arranged that cows shall calve between November and February, under the impression that the largest yield of milk is thus obtained; in Holland, on the other hand, March and April are considered the most favorable months. In order to arrive at some definite conclusion as to the respective merits of the systems, the author kept a careful record of the milk obtained from 142 cows of about the same age and condition of nourishment. One day in each week he had the milk of each cow weighed separately, and calculated the weekly yield on that basis. Until the beginning of March the cows were kept in their sheds, and thence to the beginning of November were driven out to pasture. The results obtained showed clearly that, after the month of February, a constant decrease in the yield of milk and in the duration of lactation occurred, in direct proportion to the lateness of the date when the cows calved. The quality of the milk was also inferior in the later-calving animals.

ENGLAND "NEED NOT DESPAIR."—M. J. J. Mechi, the Tiptree-Hall farmer, writing to London papers under date of June 26, says: "The old story over again—low temperature, flooding downpours, no sunshine, no ripening, crops late. I passed through 70 miles of Essex yesterday. Barley was distressingly yellow and waterlogged. Both wheat and barley fields were bright with crops of charlock (wild mustard) in full bloom. Hand-hoeing has been impossible, so the laborers' earnings have been small. Sheep still suffer from wet jacket and damp bed. Uncovered farmyards and exposed dung-heaps are contributing their "strong tea" abundantly to the brooks and watercourses. Well-drained farms, with covered homesteads and horse-hoed crops, have many advantages this year; but on all farms a more ripening condition is required. On the whole, the outlook is at present gloomy and unprofitable, but we need not despair."

TRANSPLANTING BEETS.—The Concord Ruralist, as quoted in the N. Y. Tribune, says; "In the garden there was a bed of beets which had come up remarkably thick in some places, while others were wholly bare. So I transplanted enough from the thickly grown to the bare part of the bed to equalize matters—result, they wilted, and the farmer made merry at my expense. But I had faith; watered them, and had the satisfaction of getting some monstrous beets from the transplants, while those that grew where they were sown were of ordinary size." Now if the beets when *first* transplanted, had been set in puddled holes, they would not have wilted at all, and subsequent watering would have been unnecessary. Moreover, the beets would have grown still larger.

HOW THE CHINESE RAISE WEEPING TREES.—It is stated in Regel's "Gartenzeitung" on the authority of Dr. Bretschneider who translated it for the London Gardeners' Chronicle, that the Chinese raise their weeping trees by planting two seedlings side by side. The tip of one of them is then bent downward and inarched on the base of the other, top downward. As soon as the graft has properly taken, the tree that was doubled down is dug up, roots and all, and the roots, denuded of the soil, turned uppermost, and the stem attached to a stake in this reversed position. The stem of the tree, which serves as a stock, is then cut off at the point of union of the two, and the roots of the reversed tree form the crown of the artificial tree. In this position they require shading from the sun until they have formed some branches.

LOSS OF AMMONIA.—Much has been written by theorists about the escape of ammonia, remarks Mr. J. C. Linville. The fact is, there is, as a general rule, but little free ammonia in barnyard manure when hauled to the field, and if there was, it would take flight immediately when spread, even before it could be plowed down. He once plowed a field covered with manure in the early part of August, with the exception of about an acre. This lay bleaching and roasting in the sun for about a month: a plentiful crop of weeds grew up through it, and it was turned down in the beginning of September and produced by far the best wheat in the field.

REMOVING SUCKERS FROM CORN.—Pres. Hoffman, of the Elmira Farmers' Club, as reported in the Husbandman, says that if the plants stand thick, pulling suckers will improve the crop. Some years ago he pulled the suckers from part of a corn field, and at husking found that portion had a better crop than the remainder not suckered; but it was not enough better to pay for the labor of pulling. This is contrary to the careful experiment of Prof. Beal. But different varieties may change the result, and then the season is not without influence.

A RUDE AWAKENING.—The London Ag. Gazette speaking of the Kilburn Agricultural Show, says that if an American phrase be allowable in English pages, (!) we may say that there is many a section of the show which will certainly prove an "eye-opener" to English farmers. Probably the good and fresh condition of the beef and mutton from the other side of the world, after the severest trial of the means taken to preserve it, will awaken us still more rudely to the nearness of our new rivals for the custom of the British beef-eater.

CURE FOR BARRENNESS.—Mr. A. B. Crandell says that pampered cows, overshadowed by the dignity of pedigree in a long and distinguished line, prove an annoying and expensive luxury to breeders. A cure for barrenness which is common under such circumstances, has been found by Mr. Van Meter of Kentucky, in the sovereign remedy for obesity and effeminacy—work. It is a sensible idea. Severe exercise with moderate feeding wrought the cure.

PEARL MILLET?—Blessed is the man who, having nothing to say, abstains from giving us wordy evidence of that fact—from calling on us to look through a heap of millet seed in order to be sure that there is no pearl in it.

GEORGE ELIOT.

POTTING SOIL.—A writer in The Garden says that if potting soil is placed for a day or two in the hen-yard, every particle of it is dug over, and all grubs and eggs of insects picked out.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, JULY 26, 1879.

ANNOUNCEMENT.

THE latter part of August we shall publish our Fair Edition. We promise, in advance, —life spared, — that it shall be the most costly if not the most interesting and instructive number of the RURAL NEW-YORKER ever published. We shall issue at least 50,000 EXTRA copies and ALL of our readers—our agents and the Secretaries of Fairs—are invited, indeed solicited, to send for as many copies as they are willing to give to their friends or to distribute. These will be cheerfully forwarded to any address free of any charge whatever.

THE CONTENTS OF WHICH WILL APPEAR TO THE READER AS HE READS.

EXCEPT to the inexperienced, there are very few hints of value to be given at this season to those engaged in agriculture. Really valuable timely hints have been so often published that it seems a waste of time and space to repeat them. It would be better for the few who might be benefited, to turn to old numbers of agricultural journals for such information, than that the many should again see before them a worse than thrice-told tale. It may be well to remind our readers in general terms, however, of a few matters that might otherwise be neglected or forgotten.

The budding season is now at hand, and budding may be performed with better success by the beginner than grafting. Besides, if budding fail, grafting may be tried in the spring; whereas, if grafting in the spring fail, it cannot, ordinarily, the same season be repeated. Budding is the best method of increasing such fruits as the Peach, for, in the North, grafting is usually unsuccessful. At this season, there is no transplanting to be performed, and the farmer is blessed, after the hay and small grain harvest, with an interval of comparative rest. He may, therefore, amuse himself for an hour or so each day by procuring buds of better varieties that grow upon neighboring grounds and inserting them upon seedlings or less desirable sorts that grow upon his own premises. Budding is a nice, cleanly operation, that might well be performed by female hands, but it is a matter of surprise to us that very few young ladies, or old ladies, know, or seem to care to know, anything about it. We suggest, therefore, to our fair readers that they try it once, and now. Begin with Roses, and see how many buds of different varieties can be successfully budded upon one bush. Thus it would be easy to have perhaps twenty Roses of different colors blooming upon the same plant at the same time.

Purslane, or "Pussley" as it is often called, is an inoffensive weed at worst. Yet it increases with wonderful rapidity if left to itself. Its extermination is very easy if taken in time, otherwise it gives increasing trouble throughout the entire season. We have found that purslane plants, after they are pulled up, will form and mature seeds, so that it is not sufficient that they should be pulled up and left upon the surface to die. Upon each plant a great many flowers bloom daily, and each flower will mature over 100 seeds. These are self-sown, and hence an impression has become general that the more we hoe or pull up Purslane, the faster it increases. This is due in a measure to the fact that pieces of the stem form roots readily and grow, but it is mainly due, as we have stated, to the thousands of seeds which mature and are scattered far and near. It seems an endless and an unprofitable task to pull up or hoe up every Purslane that appears in early summer. And yet, we know from experience that one hour thus employed in the middle of June, or a little later, will save many hours of labor after they have bloomed and sown their myriads of seeds.

Upon land at the Rural Grounds from which peas have been removed, we are now setting out late cabbages and celery. As to the latter, after having tried various methods, we believe that a shallow trench is better than either a deep trench or surface planting. A drill three to four inches deep would suffice. If most of the leaves be cut off and the roots placed six inches apart in such a drill—the ground, of course, having been suitably enriched and mellowed—the best results may be anticipated. We are planting only dwarf varieties. The golden and crimson varities, to which we have several times referred, were planted for an early crop. There are many farmers who do not raise celery at all, believing that it is more trouble than it is worth. But the methods of planting, cultivating and storing are now so simple, as compared with celery culture years ago, that we deem they make a costly mistake in not providing an ample supply of this delicious vegetable.

As to late cabbages: Late Bergen, Large Late Drumhead, Large Flat Dutch, and, especially for family use, Drumhead Savoy are the best varieties. For garden culture, we would again call attention to the desirability of cutting off half the leaves before setting, and of puddling the plants in holes an inch in diameter, and covering with dry soil. Treated in this way, a failure is very rare.

Early in the spring we imported from London a quantity of the new and much extolled Carter's Telephone Pea. It was not, however, planted until late, and the peas are now ripening for seed. This seed, provided we can save enough and import enough together for the purpose, we shall send out in our next free seed distribution, as in our grounds it has proven of such value that we cannot doubt it is destined to become one of our best standard varieties. The difficulty that at present presents itself, is to secure a large enough quantity. The originators hold the seed at a very high price, and even then are unwilling to send it out in large quantities.

In our flower garden, little else but mowing the lawns, weeding the beds and keeping the margins sharp and shapely, is needed. We need rain, and in consequence a few plants droop and the grass in places burns. Nevertheless, we have been taught by costly experience that artificial watering does not pay at all. In our severest droughts we lose but few plants, and the cost of artificial watering is worth ten times their value. Besides, when once begun, it must be continued until welcome rain removes the necessity.

We have given our fruit trees a last wash for the year, of lime, sulphur, salt, ashes and soap, mixed with hot water and stirred during the application. This we have practiced twice or thrice during each season since the Rural Grounds have existed as such, and, strange to say, with one exception, a borer has never entered our apple trees. Finally, good readers—we would fain call you all Dear Friends—we have been working hard during this "heated term" to prepare future numbers of our paper that shall make you feel more than ever before that of all farm helps and hints, of all money and labor-saving contrivances, you can the least afford to get along without the RURAL NEW-YORKER.

ARCTIC EXPLORATIONS.

WE know of no more agreeable topic on which to write this July afternoon, with the mercury at 98 degrees, than the Arctic regions. Even to think of the mountains of ice may be some alleviation to this torrid heat.

We are neither prophets nor sons of prophets, but for many years past it has seemed to us that all geographical research tends to show that attempts to reach the higher latitudes should be made by way of Behring's Straits or of the Spitzenbergen Sea. A map of the ocean currents will show that that great warm current, the Gulf Stream, after leaving the American continent off Newfoundland, divides, one portion washing the British Isles and giving them a temperature many degrees higher than American countries in the same latitude, while the other, diverging northwardly, leaves the main-land of Northern Europe at Norway and passes between Spitzenbergen and Nova Zembla to unknown regions above. In the Pacific Ocean the Japan current, or Kuro Siwo, divides in mid-ocean, one branch raising the temperature of the Alaskan coast till Sitka, in latitude 57 degrees, has an average temperature of 45 degrees, the same as Portland, Me., in latitude 44 degrees, while the other passes northward through Behring's Straits, perhaps to meet its fellow of the Gulf Stream in the great open Polar Sea. These two currents running northward must have a southern complement to return the waters to the equator. This is found in the one that passes down Baffin's Bay, bearing on its tide those mighty icebergs that are the terror of navigators of the upper Atlantic. It is against this current that most Arctic expeditions have so energetically striven, with so little result, since the time when in 1653 the Portuguese navigator, John Corlereal, made the first attempt to discover the Northwest Passage. He failed, and so, practically, have all his successors. There are early records that the Dutch found, in 1675, "after having sailed to the northeastward of Nova Zembla several hundred leagues between the parallels of 70 and 80 degrees, the sea was perfectly open and free from ice;" also that in 1655 a Dutch whaler sailed in a sea entirely free from ice to within one degree of the pole, and that about the same time one of his countrymen passed the pole and sailed two degrees on the other side. It is true these accounts have been taken with many grains of distrust; so have accounts of other voyagers, that have been proved true.

Behring's Strait is the name given to the ocean passage between Asia and America at their nearest approach, and connects the Arctic and Pacific Oceans. Its central part may be described as in latitude 66 degrees and longitude 168 degrees. At its narrowest it is only 26 miles wide, and its depth in the middle is about 30 fathoms. Such icebergs as are frequently seen off Labrador would run aground there. The temperature of the water is much higher than that of the same latitude in Baffin's Bay; the current runs toward the pole instead of away from it, thus aiding instead of opposing vessels in their upward journey.

Several attempts have been made to reach the pole by way of these straits, the most notable of which are those of Captain Cook in 1779; his successor, Captain Clark, in 1780; Kotzebue, of the Russian navy, in 1815, who claims to have seen the open polar sea. Several whaling ships have passed many miles beyond the straits, but not as explorers. This pathway has been neglected heretofore, probably because of the difficulty of properly fitting out vessels adapted to the purpose on the Pacific coast, but this objection no longer exists. Already the expedition inaugurated by Mr. Bennett, proprietor of the New York Herald, has sailed from San Francisco complete in all its equipments, and the expectations are great that it will completely succeed in establishing, without room for future question, that an open Polar Sea is a fact.

But whether this expedition may be so entirely successful, there is little doubt it will result in reaching a higher point than has been attained above the straits, and that many of the secrets of the Arctic region will be laid open to us as new pages in the book of nature.

BE A FRIEND IN NEED.

THE necessities of pioneer life originated certain useful and commendable customs. When a cabin was to be built, the neighbors collected, joined with alacrity in the work, finished the heaviest of the task, and realized all expected pay in the sumptuous feast and the simple and lively pastimes of the evening. It was common for the thoughtful matron to combine a quilting-party with the house-raising, and secure generous help in her domestic interest. As years advanced, and society and customs changed, there were occasional instances of free, united help to those who, for any cause, needed it. At present these beautiful expressions of good-will are, at most, very rare. Too many now content themselves with rendering to neighbors simply what they can justly and legally claim, or with bestowing the incidental, individual favors that can be conferred without much care or expense. People seem to know less of, and care less for one another than formerly.

There is need of some recognition of old ways in these matters. To pay what one owes is legal honesty; to do for a neighbor what he really needs is benevolence. After all our assumed independence and extravagant self-love, we depend, to a considerable degree, on one another. There are many accidents to which we all are liable, which may call most affectingly for a little temporary assistance. A farmer may lose his only horse in the crisis of his crop. He may have protracted sickness or some disabling injury when his farm most needs his attention. A family may suffer a terrible visitation of some dread disease. Fire may destroy buildings, or floods sweep away crops and fences. What is the poor man to do? His neighbors may think that their own trials are so heavy that they have no time or means to spare. But let them think again. They can spare *one* day, and, perhaps, not see any ill effects. Or they may, each, contribute a small amount in money or valuable articles, without any appreciable privation to themselves or their interests. The many "littles" in work or means will restore hope and strength to the unfortunate, and secure to the giver a richer reward than the pioneer enjoyed in his evening's festivity.

Is there any necessitous case in your community? If so, go forward yourself, and propose the generous enterprise of combining the trifles in time and money, and thus win for yourself and others the sweet reward of gratitude, self-approbation, and all the blessings from both man and Heaven that are accorded to a generous deed.

Fortune is to-day quite as fitful as ever. We may now be able to help while others need. Ere long we may sorely, sadly need, and the grateful recipients of our kindness may come to our relief.

BREVITIES.

A NEIGHBOR raises good crops of corn between his strawberry rows.

THE London Farmer says that seven per cent of the sheep in Baltimore (!) are killed by dogs!

MR. JOSEPH HARRIS cannot too earnestly recommend the use of superphosphates for turnips.

WHEN attacked by the flea, sprinkle lime-dust over the leaves of turnips early in the morning.

COUNT STONE is the English of Graff Stein, a German after whom the now celebrated Gravenstein Apple was named.

"AGRICULTURAL FAIRS."—A name which enables good people to attend horse-races without doing violence to their consciences.

THERE is no better time in the year for ridding the gardens and fields of weeds than the present. Usually droughts of greater or less severity prevail, and weeds pulled or plowed up die at once. Plant Cauliflowers, Sage, late Cabbage, Celery, Thyme.

THE object of articles published under the heading "The Truth About it," we may say to our new readers, is not so much intended to deal with "Humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.

THE Sharpless Strawberry originated with Mr. J. K. Sharpless, of Catawissa, Pa. Among those who have tried it, we believe it has more friends than any other of the new sorts. Mr. Sharpless is to be congratulated and thanked by the strawberry-loving community.

IF you would raise large crops of Rutabagas, spread over the land a liberal dressing of old manure and plow it under. Then sow 250 pounds of superphosphate to the acre and harrow well. Then drill in the seed. Of all the concentrated fertilizers, none is better for turnips than superphosphates.

HOW often in the course of our lives we have "branched off" into the new-fangled annuals for bedding purposes, and how often have we returned to the Petunia, Portulaca, Phlox, Pink, Verbena, and such other good old plants that may be trusted to keep up their blooms for most of the season, let the weather be what it may.

FRIENDS visiting us ask: "How do you keep the stems of your fruit trees so clean, so free from rough bark, so healthy-looking?" We use a wash, often referred to in these columns, several times every growing season, and keep a ring of earth about five feet in diameter smooth and free from weeds. To what extent the clean stems are due to this we cannot say.

MR. W. R. LAZENBY has said, we do not know when or where, that, after numerous experiments and very careful trials, he finds either of the following applications "safe, cheap and effective" for the cabbage-worm: A pound of whale-oil soap in about six gallons of water; or, a few quarts of tar in a barrel of water. The use of either, two or three times during the season, suffices.

THE difference between the good and poor farmer may be seen better in an unfavorable than a favorable season. In the latter case crops are so large that they will scarcely bring enough to pay for producing them. But in unfavorable seasons the good farmer is rewarded for his skill and patience. The poor farms suffer more than the good farms—the good farmers reap the benefits.

THERE is one sort of farm animal that agricultural papers do not say much about. It thrives on all farms, will eat what it can get, requires no care either in winter or summer, multiplies rapidly, suffers from no contagious diseases, and, judging from the fact that one or more may be found upon all farms, whether large or small, ought to be highly esteemed by farmers in general. We allude to the cat. The cat, next to poultry, is the most neglected animal on many a farm.

AMONG the best sorts of turnips for sowing from now till the end of August, are the following: Cow-horn, White Norfolk, Red-top Strap-leaf, White French, Yellow Stone, Golden Ball, White Egg and Yellow Globe. Root crops of all kinds are more and more appreciated in this country as the necessity of mixed food for stock is recognized. Turnips germinate quickly, and farmers should be provided with lime, ashes or soot to scatter over the drills or over the entire field, if broadcasted, as soon as germination begins, in order to protect them from the fly. If thus provided, half of the seed usually sown will suffice, and the sowing of the lime or ashes is really less trouble than the hoeing out of the surplus plants. We have no doubt that half a pound would suffice for an acre if sown in drills by hand, and that with proper cultivation the crop would prove larger for it.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DESCRIPTION OF CUTS.

Costumes and Polonaises.

No. 1.—The toilette illustrated is simple to make, as the skirt consists of a plain model trimmed with plaitings, and the remainder of the costume is composed of a basque and a dainty little wrap of the fichu style. The trimming may follow any outline dictated by individual taste, or may be applied to any overskirt that may be desired as a part of such a costume. Plain lawn with printed borders makes up handsomely; the border always edging the plaitings. The pattern of the skirt is No. 6410, price 35 cents; of basque No. 6647, price 25 cents. The wrap is simply a cape that is round at the back and pointed in front, and has a collar of corresponding shape. Pattern No. 6648, price 20 cents.

6632

No. 2.—A stylish costume of silk and grenadine is here represented. The polonaise is cleverly contrived, and is very appropriate for washable fabrics as well as those of silk or wool. A novel decoration for the bottom of the polonaise is formed by cutting the bottom in points and facing them on the outside with the silk goods, and concealing the top of the facing under a ruching of the same frayed or fringed at each side and closely plaited. A frill of Spanish lace is set underneath the points to finish the decoration prettily. Skirt pattern No. 6621, price 35 cents. Polonaise pattern No. 6645, price 30 cents.

No. 6645.—Ladies' Circular Polonaise.—This polonaise is so well adapted to washable goods and light silk and woolen textures, that it is extremely popular. As expressed in the title, it is in circular style, and consequently there is a bias seam through the center of the back. Lawns, organdies and momie cloths, will be largely made up in this material. A tiny cord may be sewed to the edges of the back seam when the polonaise is made of very thin goods, to prevent the bias edges from stretching. A grenadine polonaise made up in this way, has the *revers* entirely covered with jet *passementerie* and ruffles of French lace, and the sleeves which are cut off just below the elbow, are striped lengthwise with *passementerie* and finished with one standing and two falling ruffles of lace. Price 30 cents.

No. 6655.—The skirt and overskirt are permanently attached, but in such a way that they may be washed and ironed as easily as if separate; and the drapery of the overskirt may be let down so that it will be entirely plain, except a few gathers at one side. Costumes like this are made of lawn, organdy, *pique*, cambric, print, or any washable material, and trimmed with Hamburg embroidery, Cluny, Breton or Italian lace, ruffles or plaitings. Alternate rows of black and white braid are used in the model. Price of pattern, 35 cents.

No. 6632.—Ladies' Overskirt. While this overskirt is stylish with long or demi-train skirts, its short front-gore and close drapery make it also decidedly fashionable for wear with short walking-skirts. This model is adapted to silk, satin, silk and woolen mixtures, barèges, and nearly all kinds of suit goods. Fringe, lace or plaiting may be added to the sides, and for thin, gauzy materials they are an improvement, but they are not required by firm textures. Grenadines made up in this way will have the front covered entirely with scantily gathered ruffles of French lace. Price of pattern, 30 cents.

Hats and Bonnets.

No. 3 is trimmed with a band of gilt and silk mixed in the weaving, and two or three ostrich tips. The hat may be worn on or off the face, rolled on one side, bent in front or in any manner a body may think most becoming.

Nos. 4 and 5 are back and front views of the Virot bonnet. The No. 4 is of chip and trimmed with satin, satin ribbon and a fancy feather. No. 5 is of Leghorn, with the brim lined with shirred cream-colored satin edged with cord, and the trimming consists of a scarf of Breton lace.

No. 6.—"Alpine" Hat.—The brim undulates, rolling quite high at the left side. A band and full rosette-bow of ribbon, together with a couple of tips, handsomely trim the hat.

No. 7.—Misses' Marguerite Hat.—This is composed of fancy straw, and is more of a garden, lawn or rustic hat. It is faced with silk and ties of same color extend across the front of the crown. A bunch of flowers finishes the trimming.

No. 8.—Girls' Normandy Cap.—The foundation of this crown is stiff net, which is folded so as to make a sharp peak at the top. It is sewed to a straight brim portion and has a cord inserted in a tiny casing at the back of the neck so as to regulate its size. The crown portion is overlaid with silk, laid in plaits at the center, and the brim is bound with the same and then overlaid with two frills of cluny lace, which continue about the entire margin. The front portion of the crown is concealed by four upright frills of lace and a fancy bow of ribbon, while ribbon also extends about the edges of the marginal frills and forms another bow at the back. The sides of the crown are covered with strips of insertion joined diagonally and bordered with the same edging as that forming the frill, while the row of insertion next the highest is also edged with a lace frill. A less expensive cap may be made by covering the crown with fine Silesia—either blue or pink—and overlaying it smoothly with dotted Swiss. No. of pattern 6640; price, 20 cents.

6632

No. 9.—Ladies' black lace fichu. This is stylish over a black dress or a light one, and may be made of Breton, Spanish, French or Guipure lace.

No. 10.—Ladies' Pompadour collarette. This is to be worn over a high dress or over one with a square-cut neck. The joining of the outer standing and falling ruffles is concealed by lace insertion, and ribbon bows are caught to the left side, at the corner, and above the upper cross-row of lace. *Crepe lisse*, or Breton or Valenciennes lace may be used in making this Pompadour with charming effect, and the more delicate the tint of the ribbon selected, the daintier the effect.

Why is it that a nice easy-chair at home is so much less comfortable to a man than the hard side of a day-goods box on a street-corner with a crowd of loafers around?—*Steubenville Herald*.

No. 1.

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 462.)

CHAPTER XXXIV.

TRULY BEAUTIFUL.

But as Ada Carisforde's cold hand would have unclosed the outer door, she was clasped in a close embrace, and carried, rather than led back into the parlor. Noel had followed her: it was he who now held her in his arms, and drew her head down on his throbbing breast, and kept it there in spite of a little resistance.

"Am I to believe the strange tale you have just told me?" he demanded, with his lips very near her forehead, for in the joy of seeing her once more he was strangely bold.

6645

"You must believe it, for it is true—quite true," she faltered. "I was told the other day—no matter by whom—that the marriage of my parents—which was celebrated abroad, according to the rites of the religion my mother professed—was informal. I have been to Rome, and ascertained that it is correct."

"And you thought I should gladly take advantage of your discovery."

6645

"You must do so," Hillian persisted. "I have acquainted Mr. Whitely with this fact, and bid him take the necessary steps to secure to you your rights."

"You are very good—very generous, Miss Carisforde, to do this for a relative whom you despise ——"

"No—no!" she vehemently interposed.

"Well, then, suspect of willfully tricking you."

"I believed that I had good reasons for the suspicions I entertained," she sighed. "But do not add your reproaches to the weight of my unhappiness. Heaven knows I am miserable enough."

"You speak as if you were half inclined to admit that you have made more than one discovery; that something or other has led you to the conclusion that I have not been guilty of all that was laid to my charge. Am I right?"

"Yes," said Hillian. "I could not see my way out of the web that was so cunningly wound about me, till I had a glimpse of the motives of the reptile who worked upon my weakness for his own ends. I should like to hear you say that you forgive me, Lord Carisforde, for all the injustice with which I have treated you."

"By this kiss, and this. I not only forgive you, but love you better than ever!"

But now, rosy with confusion, she struggled out of his arms.

"No—no, I did not mean that; only to—to be good friends before I go away again."

"And where would you go?" asked Noel, imprisoning one of her hands.

"For to-night, do you mean? To the hotel where Mrs. Hurst is waiting for me; to-morrow we shall join her sister, Miss Gray, at her cottage by the sea, where I hope we shall soon hear of your being publicly installed at Carisforde."

"Never, unless you go there with me as its mistress," cried Noel. "If it is I who am rich, I need no longer hesitate to say all that is in my heart, and I tell you, once for all, that I will not accept this property, nor live at the Park, without you share sovereignty. Ah! Hillian—beloved Hillian, can you not comprehend that my only craving for wealth has been that it might give me the woman I love? I have not coveted riches for myself, but to enable me to make a home worthy of my bride."

"There are others fairer," she faltered.

"But none dearer," he promptly responded. "Look up, and confess that you believe this."

But Hillian would not or could not do this, and her voice trembled more than ever as she demanded whether she ought to permit him to make such a marriage.

"Nay, Hillian, none of these scruples, pray!" he pleaded. "You love me? Yes, you do not deny it. Only say that you have conquered the distrust which I am not conscious of having done anything to deserve; then promise that you will be mine, and I shall be happy, indeed."

"But you have doubted me also," she reminded him. "Although Mr. Dunforth may have deceived me, when he hinted that it was with your connivance he came to Carisforde, and forced himself into my confidence, I cannot forget that you yourself questioned me about events that I did not wish known."

"But I could have told you if you would have let me, that it was from Dunforth I heard of these things;" and Noel repeated how Clement professed to have recognized her as a suppliant at the lawyer's office, and afterwards as charged with theft, under the name of Smith.

"How dared he so distort the truth!" cried Hillian, indignantly. "Now, hear my version. Once, when I was bitterly feeling papa's coldness to me, I determined to enter a convent, and pleaded with tears to be permitted to carry out my intention. I was so miserable, so lonely, that on my knees I prayed papa's solicitor to intercede for me, and let me hide my repulsive ugliness in the cloister. When my prayer was denied, I escaped from my aunt's guardianship, and at night and alone, endeavored to find my way to the house of a sisterhood, in which I intended to enroll myself. Some wretched women, attracted by a valuable

trinket I wore, dogged my steps, till, mistaking my way, I was at their mercy; and then they would have robbed me, if a policeman, who was fortunately near, had not interposed and protected me. I was so ashamed of this escapade, that drew upon me my father's severest rebuke, as well as Mrs. Hurst's, that I have never been able to bear to have it mentioned."

6655

"Then you have not been known at any time by the hackneyed name of Smith?" cried Noel, gaily, for this simple confession had swept away the only cloud that had ever rested on the fair fame of his Hillian.

"Never! Was it to this you alluded the other day? You spoke of the name I then bore, and I jumped to the conclusion that you had known me all along as Ada Carisforde. How hasty, how mistaken I have been. Yet, if you knew how systematically I have been deceived——"

"By Clement Dunforth? I guessed as much, yet knew not how to convince you of his baseness. Herr Rudolsheim, who studied him closely, believed that he was artfully endeavoring to win his way into your favor, by making you believe that every one else was wronging you. Was it so?"

"Alas! yes; and he was so plausible, that I was harassed and bewildered between my reluctance to think ill of you, and the apparent candor and truth of his assertions."

"My Hillian, more experienced people than you and I might have been duped by this clever gentleman. The Herr said he was bold enough to meditate wooing you. Ha! he has done this also, the scoundrel! and you, Hillian?"

"Repulsed him with the scorn he merited; for when he spoke of marriage, my eyes were opened; or if a doubt still remained, it fled when he threatened me with the loss of my inheritance if I refused to be his."

"He did this!" exclaimed Noel, clenching his hand. "He shall yet be made to rue his insolence!"

"Nay," said Hillian, softly; "why should we be angry with him? But for his threats I should not have discovered that this tiresome estate, which has been such a burden to me, is not mine, but yours."

"Say ours, love—ours!"

Hillian smiled a happy smile, as she responded: "Ah! but you would never have said this if Clement Dunforth's threat had not led to my coming here to-night. Oh! Noel, you have been very proud—unkindly so!"

"Honorably so, love; and this is my reward!"

He was taking it from her lips, when Irene ran in, to cry out first in astonishment, then in delight and hug her relative till Miss Carisforde was forced to pray for mercy. Mrs. Estcourt was rather embarrassed when she learned the true name of the Hillian Gray whom, as a dependent, she had despised and often snubbed; but, as the warm-hearted girl was too generous to notice her confusion, she soon overcame it.

As Hillian positively refused to return to Carisforde Park until she went there as its owner's bride, Mrs. Hurst was persuaded to remain in London. She found plenty of amusement, however, in selecting the *trousseau* of her niece, who was even more pleasantly occupied in assisting Noel to carry out arrangements for the comfort of his stepmother, and the education of her children.

Once, as they came out of a jeweller's shop, where they had pleased themselves with selecting some ornaments for Irene, Clement Dunforth accidentally jostled against them. Never at a loss, he lifted his hat to Hillian, and nodded familiarly to Lord Carisforde; but his lip was savagely bitten as, without appearing to notice him, they walked on. His artfully-laid schemes, instead of benefiting himself, as they were intended to do, had proved the means of bringing together the persons he had left no means untried to keep apart.

Irene had resumed her friendly relations with Miss Jenkins, and learned from her that Clement Dunforth would have gladly returned to his old allegiance, but she had long ceased to feel a spark of affection for so fickle a lover, and would often laughingly declare that she was destined to remain single and be the good spinster aunt to the children of her brothers and sisters.

She said something of the kind in the hearing of Dr. Monson, who never came to town without finding an excuse for calling.

"Remain single!" he echoed. "Not with my consent, Miss Estcourt. If I were not conscious that it would be madness for an obscure country doctor, nearly twenty years older than you are, to offer himself, I should say—— But, hallo! what's this?" for Irene, crimson with blushes, was hiding her face on her brother's shoulder. "Dare I hope? Speak for me, Lord Carisforde—ask her if she will indeed consent to be mine!"

Irene murmured something about mamma not being able to spare her, but when Noel—telling her he would arrange that—put her hand into the delighted Doctor's, it was not withdrawn; and when Dr. Monson proposed that Mrs. Estcourt should be prevailed on to surrender Maggie to her sister's care, the cup of her joy was full.

About this time, Major Blenkinson—Miss Carisforde's guardian—arrived in England, and with his consent the day was fixed for her marriage. She had never been abroad, except to make the hasty visit to Rome, and the glimpse she had then caught of foreign scenery led her to express a wish to revisit Italy. It was therefore agreed that their bridal tour should be a Continental one, and that they should contrive to visit Herr Rudolsheim either in going or returning.

Noel was hunting in his desk for the address the Herr had given him, when from a corner he drew a yellow-looking envelope, at which he gazed doubtfully for a minute, and then, with a gleam of recollection crossing his face, threw it into the lap of Hillian, who sat beside him.

"Love, this is yours. I ought to have returned it sooner; but it quite escaped my memory that it was in my possession. You must have dropped it when you paid one of your ghostly visits to the library."

"I do not remember it," she said, as she examined the paper; "but it may have been amongst some old letters of my mother's, which I removed to my own escritoire. Ah! Noel, what have you given me?"

He turned quickly towards her as he heard the frightened exclamation. She had opened the envelope, and was gazing at a certificate of the marriage of the late Viscount, which had been celebrated a second time as soon as he and his bride landed in England.

No 2.

"I am so glad—so very glad this was not found sooner!" Hillian joyfully murmured. "It can make no difference now. Even your pride, Noel, will not let it interfere with our happiness. We understand each other now too well to let the question of which has the greatest legal right to the estates disturb us."

"Love, I am content; for though the world may misjudge me, I don't fear that you will," was the reply. "You know that it is for your own dear self I wed you—not for money or land."

"But, Noel, there is one thing still troubles me a little," she said, presently. "In spite of all your kindness, I cannot forget that I am one of the plainest of women. Generous though you are, will it not sometimes cost you a pang when you hear those words whispered, and see people shrink from me because of my uncomely appearance?"

"Hillian," was the reply, "your fears are morbid ones; and so pray banish them. Have you yet to learn that it is not mere regularity of outline that makes a countenance beautiful? Your father's devotion to his fair young wife, and his passionate admiration of the loveliness that faded so soon, must have made him feel the disappointment keenly, when he saw that his child resembled himself, and not her lost mother. But for this he would have discovered, as I did at our first meeting, that this dear face had a charm of its own, far beyond the mere outward prettiness that wins the eye, but not the heart. I neither flatter nor exaggerate when I say that in my sight you will always be fair."

And Hillian convinced by his earnestness, was content; or if, in after days, her sensitive feelings on the subject of her appearance were stirred by some chance-word or look, she had but to gaze into the eyes of her lover-husband, to see there such unwavering tenderness, that she banished her uneasiness. In the domestic felicity that was now her lot she almost forgot at last the miserable time when she hid herself from the world, and never dared to hope that love or wedded happiness could ever bless the future of AN UGLY GIRL!

THE END.

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER II.

The grass-grown old garden was looking quite picturesque in the morning sunshine, and Olive had brought Nelson out to stroll up and down the glistening, rain-washed paths, with her strong young arm for crutch. Pigeons were cooing and sunning themselves on the red-tiled roofs, dark branches and twigs stood out still and delicate against the fair blue sky, and in the air was that curious yearning that comes with the spring.

"The leaves will soon begin to bud," Nelson said dreamily. "Olive, what was that you were reading to me the other day about the 'queer power of Art—that, when you wish to describe its effect on you, you always take to describing something else—that you cannot be sure that a picture is not a beautiful melody or a verse of Tennyson's?' I think this is a Mendelssohn morning, and the brown earth, and the crisp, wet grass, and the shadows and lights on the red roofs are the notes that make up a song without words."

Olive smiled and laid her hand on the boy's head, Nelson drew in a long breath of the cool, fresh air.

"I am so glad we are not going away to smoky Birmingham," he said. "But why do we stay here? Has the manager given you some more money?"

6655

"No, my dearest. But I will tell you why we have not gone away. Last night Dr. Yorke asked me a very serious question, and I begged him to give me till to-day to consider it."

"A question?" Nelson looked up with his old-young glance, and as he saw his sister's face he flushed up to the roots of his hair. "Olive," he stammered, "it was not—that—that he wanted to take you away from me?"

"No, no, no!" Olive knelt down in the sheltered garden walk, and put her arms round the boy in close embrace. "Do you think that he could ask such a thing, or that I would listen to it? My dear, my dear!" And they kissed each other solemnly. "Listen!" Olive went on, when they had reached the wooden bench at the end of the garden, and were sitting hand in hand. "You know how kind Dr. Yorke is?"

"Don't I? Olive, he is a brick! And I have seen this many a day that he likes you very much, pretty Olive!"—stroking her blooming cheek.

"How would you like to live with him always—never to go traveling any more, but to have a home, and a room all to yourself full of music and pictures and books, where I should be with you, just the same as ever?"

"Oh, Olive!" Nelson's face showed plainly enough what he thought of such a prospect, and his sister's brightened as she saw his delight. "But"—he faltered and changed countenance—"I am very selfish; I had forgotten. The stage, the profession—you will never be happy in any other life."

"We shall be together still, my darling, and—is the thought of what might happen if I were ill—even this accident of mine has emptied the bank, I am afraid."

"And you have to work so hard. But still, to give up all your parts that you are so fond of, Olive—why should you, unless you like Dr. Yorke very much indeed?"

"I love you, Nelson," Miss Carew said, tightening her hold on his frail little hand. "And"—with a sad little laugh—"the stage will have no great loss in Olive Carew."

"But indeed it will!" Nelson cried. "And, if people did not think so, why should that Birmingham manager have offered you so much money?"

"Well, my dearest," she said lightly, tears starting to her eyes, "you shall be audience sometimes when—I am married. We will shut ourselves up in your room, and you shall play a grand overture, and I will let down my hair and act! Won't that be fun?"

Nelson clapped his hands gleefully, and just then a tall figure appeared at the end of the garden walk, and Olive knew that Dr. Yorke had come for his answer.

"Time for my wine!" said Nelson, with his pretty old-fashioned delicacy, and, putting his arms round his sister's neck in a feeble little hug, he limped away, crying a cheery "Good morning" to the Doctor.

Miss Carew rose. A slender, bright-haired figure, in her straight, black gown, she looked like some girl in a picture, against the vivid background made by the green boughs and the old gray walls and red roof, with the pigeons fluttering and cooing overhead. And the sudden pallor that blanched her cheeks as she went to meet her lover made her look prettier than ever, Robert Yorke thought, as he took her hand in his.

"I am come for my answer, Olive," he said abruptly, with grave, longing eyes looking down at her girlish face. "Is it to be 'Yes' or 'No'? My dear, don't keep me in suspense."

Olive smiled sadly, but she colored, too, and put up her hand nervously to play with her earring.

"I have something to tell you," she said, in a slow, reluctant way. "And after that it is you who must say 'Yes' or 'No.'"

Dr. Yorke felt uncomfortable, he did not know why.

"What if I say 'Yes' now, before I hear this little history?" he asked, forcing a smile.

"It would still have to be told; please sit down and listen"

The pigeons cooed and flapped their wings, and made little excursions to neighboring roofs; a patch of sunshine on the garden wall; voices of children and the slow creak of heavy wagons sounded from the street.

No. 3.

"If it is that you don't love me as I love you, Olive," the Doctor began nervously, "I will spare you the confession. How should it be otherwise?"

"But it is something more. It is that—that I love some one else."

A dead silence followed these low words, while Olive's heart beat fast with regret and uncertainty, and a strange, unwilling hope, and the Doctor buttoned and unbuttoned his glove, and was conscious of changing color.

"I might easily tell you," Miss Carew went on, as soon as she was able to speak, "that it is all over—that I have forgotten it. Some women would say this, perhaps, but I cannot. I love a man who can never be anything to me—and that is all you will ever know. And now you see I was right in saying that it is you who must say 'Yes' or 'No.'" The Doctor did not speak. "If I were alone in the world—if I had not my boy to think of"—and now there was a pathetic tremor in Olive's voice—"I would not marry you, for you deserve the best love a woman can feel, and I cannot give you such a love. I know it is a shame to offer you anything less, but see how I am tempted!"

Dr. Yorke lifted her fair trembling hand and kissed it.

"Do you wonder," she cried in a sort of passion, "that I cannot send you away as I should do? I am so lonely—there is no one in the world to look at me and speak to me kindly as you do. I think my heart is tired of aching for what will never come back; for it is pleasant to know that you think of me as good men think of the women they make their wives—that you do not take it for granted I am bad because I am an actress."

"Olive!"

No. 4.

"Yes—I know; but men do think so, Dr. Yorke. How should they know what I learnt from my poor pretty little mother in the days when we had a home and were so happy together? She was not afraid to let me go on the stage, you see! She was not afraid to trust Nelson to me when she lay dying two years ago, and all our tears could not keep her with us one day longer."

"Olive! My child!"

"I cannot help crying when I think of the happy old times. It is not often I talk of myself, but I want you to know me better. I want you to be sure that the only fault I have been guilty of has been to think too much of a man I can never marry. That is all. It was very wrong, I suppose, and sorrowful, but I could not help it; it is still a dear recollection to me, and I cannot pretend to put it out of my heart for ever."

"My dear, I will not ask you to do that."

"There is not a thought in my heart which you might not read, Dr. Yorke—not one. And, if I have no love to give you, at least I have the warmest liking—gratitude—respect."

"Look at me, Olive," Robert Yorke said gravely, with a sigh; and the girl turned her candid eyes upon him at once. "I am no longer young—I am not a man to win any woman's fancy, I think; but, if you can trust your future to me, I will try to make you happy—you and Nelson."

"Dr. Yorke—I——"

"Give me your hand, my dear. It's more to me than another woman's heart."

And Olive surrendered it, cold and trembling, into his kind steadfast clasp.

Dr. Yorke went home half an hour earlier that evening. Gertrude, who was in the drawing-room, was startled by the click of his key in the door, and by hearing her sedate cousin run upstairs two steps at a time.

"Good gracious, Robert!" she exclaimed, as he burst into the room smiling and eager. "Is it so late? I must go and dress for dinner."

"Wait a bit," Gertrude, the Doctor said, clasping her hand as she passed. "Never mind dressing for dinner to-day. I have something to say to you."

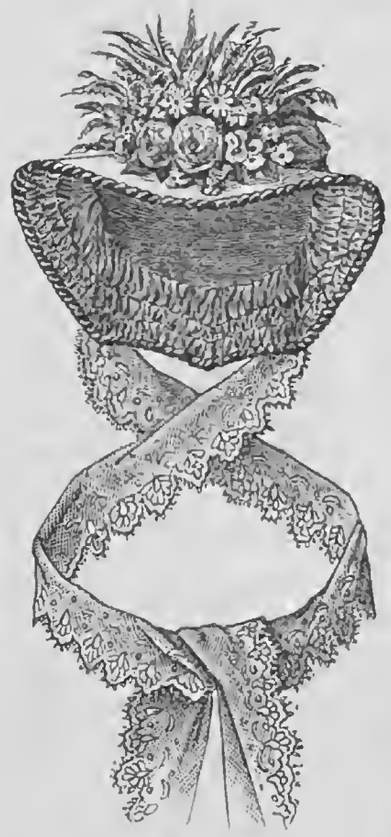
Gertrude was fluttered. In some doubt she looked at her dress, then at her cousin's agitated face, and with a blush sat down again and took up her work.

"What is it, Robert?" she asked, putting her basket of wool out of reach of his clumsy nervous, fingers. "And make haste, please, or my aunt—"

"I want you to make me a promise, dear," Robert interrupted, leaning his elbows on the table, and looking into Gertrude's gray eyes, which fell before his gaze. "You know that Aunt Elizabeth is very much attached to you, and thinks you are a dear good sensible girl."

"Oh, Robert!"

"We have been very happy together, we three, haven't we? And it would be a pity that anything should occur to break up such a pleasant home."



No. 5.

Gertrude's buxom chest heaved; the color deepened in her plump face.

"Now, if I were to ask you," Robert continued, "to use your influence with our good aunt to reconcile her to a step I resolve upon taking, and which may at first cause her some annoyance——"

"I don't understand you, Robert," Miss Fisher interrupted, a little pale now. "What can you be going to do that Aunt Elizabeth would disapprove of? Surely, after all her kindness——"

"Yes—yes, but there are times when a man must decide for himself, Gertrude, and"—the Doctor leant forward and kissed her round cheek affectionately—"I am going to be married, my dear little cousin, and I want you to love my wife, and be kind to her for my sake."

The work trembled in poor Gertrude's hands, but she went on pulling the ivory needle through the loops and meshes, trying to hide the bitter disappointment that was swelling in her throat and dimming her eyes.

"Come, dear, have you nothing to say?" the Doctor asked reproachfully.

"I am sorry I cannot congratulate you, Robert," she answered in a husky and uncertain voice. "It is to that—that person at the theatre, I suppose?"

With an effort Dr. Yorke controlled his annoyance.

"That person, as you call her, Gertrude, is a girl like yourself, good, pretty, educated. I hoped you were too far above vulgar prejudices to condemn her unknown, because of her calling."

"I have never spoken to an actress in my life," Gertrude said crossly. She too had had her little dream, and was it likely she should feel very kindly towards this rival who had so soon dispelled it?

"But, if I tell you that this actress is a—an angel of goodness, devoted to her little brother—that Miss Carew is a lady in the truest meaning of the word, and——come, won't you be kind to this girl whom I love so dearly?"

No. 6.

Short-sighted Dr. Yorke!

"I really don't know what my aunt," Gertrude began, but Robert made an impatient movement.

"For Heaven's sake, Gertrude, speak for yourself for once!" he cried. "Never mind what other people do or think, but promise me that my wife shall have one friend at least in her new home."

Gertrude could not shake off the old feeling about her cousin all in a moment, even though he was engaged to be married, and the kind pleading voice she had learned to like so well touched her in spite of herself.

"I'm sure, Robert, I will do whatever is right," she said, rising and turning away to hide the tears she could not keep back any longer. "I don't think poor papa ever intended me to live in the same house with a public character, but I hope you may be happy!"

No. 7.

Dr. Yorke dined alone. A servant brought him word that Miss Yorke was indisposed, and that Miss Gertrude would remain with her aunt.

"So the battle begins," he thought, smiling grimly. "Well, my shoulders are pretty broad—but"—the Doctor drank his glass of sherry, and set down the glass with ominous force—"if they hurt Olive!"—To be continued.

WHITTIER AND GARRISON.

THE poet Whittier, the life-long friend and co-laborer of Garrison, sent the following tribute to his memory to be read at the funeral service:

The storm and peril overpast,
The hounding hatred shamed and still,
Go, soul of freedom, take at last
The place which thou alone canst fill.

Go up and on; thy day well done,
The morning's promise well fulfilled;
Arise to triumph yet unknown,
The holiest tasks that God has willed.

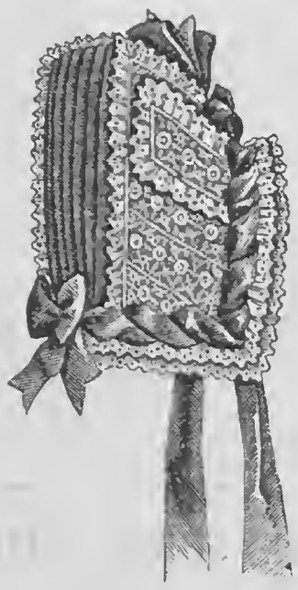
Go! leave behind thee all that mars
The work below of man for man;
With the white legions of the stars
Do service such as angels can.

Wherever wrong shall right deny,
Or suffering spirits urge their plea,
Be thine a voice to smite the lie,
And hand to set the captive free.

A TRIP TO BORNEO.

THE following extract from a letter I lately received from my esteemed friend, Mr. F. W. Burbridge, of London, in reference to his late trip to the East Indian Archipelago, may be interesting to some of the RURAL readers. W. F.

"As to my trip to Borneo, I got on fairly well. It is a beautiful country, in which you can go anywhere and do what you like—no laws, jails, workhouses, railways, horses, carts, not even a fence or a board warning trespassers, so common in England—just a wild forest-land, with here and there a village and a few fields cut out of the wild, and planted with rice, caladium esculentum, sweet potatoes, cotton, maize, fruit trees, and a few patches of tobacco. Men and women are gentle and friendly, as a rule. Now and then a fellow runs 'amuck,' drawing his chopper and slashing at everybody he meets, until somebody puts slugs through him or pins him with a spear. These mad fellows are about as rare as mad dogs in London, and about as dangerous.



No. 8.

"One or two of the tribes inland, as the Kayans and Muruts, keep up the old kind of life, living principally by hunting wild pigs, cattle and deer, all their farming being done by the women. These tribes are nearly always at war with one another, and if they kill an enemy they preserve his skull as a trophy. In some of their houses you may see a hundred or two of these skulls, but many of them very old and rotten. They use them in decorating their houses at their periodical feasts. They make raids on each other, killing the men and taking the women and children as slaves. All through the East women do most of the work, and are not of much account; a woman and a buffalo are about equal in value.

"Coast and river journeys are made by native boats, pulled by 10 or 12 men with paddles, or they act well with a wind. All Malays are good sailors and the worst pirates in the world, although not now so common as formerly. All inland journeys must be made on the back of a big water buffalo or on foot. The roads are like sheep-tracks on the hills; in the valleys you are up to the knees in mud or up to the arm-pits in water. Sometimes on the plains you may go a mile or two in soft mud a foot thick, and the whole way through a tunnel of overhanging grasses and sedges. The climate is the most uniformly hot, and wet, and feverish in the world. Snakes are plentiful; monkeys, ourang outangs, scorpions, centipedes, etc., are plentiful, too. The only dangerous animal, however, is the alligator, a big, ugly, voracious brute; and the one which gives one most trouble and pain of all is the mosquito.

"Plants do well here. Tree ferns are lovely, 30 feet high; Bamboo, 60 feet high. Orchids are plentiful in places; Phalænopsis grandiflora is the best. There are some beautiful Renantheras which will not bloom at home. Mangoes, Oranges, fine Pomaloes, Limes, Durian, Mangosteen, Bananas, etc., are abundant. Grapes and Figs fail miserably, and Pomegranates and Melons are poor—too wet for them, and too uniformly hot for Figs and Grapes. The finest plants are Palms and big Nepenthes, the latter—of which there are four species on the 'Bornean Andes'—are wonderful. They grow at an altitude of 10,000 feet, where it is cool and wet, and soon go wrong on the plains. Their habitat is seven days' direct journey on foot inland.

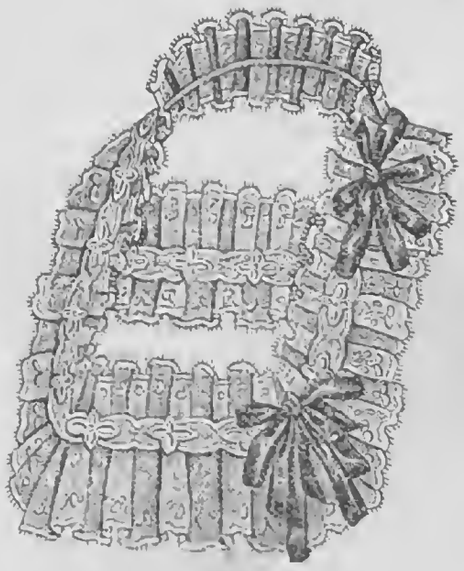
THE PHILOSOPHY OF WRINKLES.

TIME and physical suffering cause the creases about the eyes more than anything else. Therefore, with proper attention to your health, you have it in your power to avoid many of these. Nervous suffering often gives a hard look to the mouth, and sometimes pulls it out of shape. We all of us that are worth anything must go through more or less of it. But the spirit in which we bear it will be sure to leave its impress about the most mobile of all the features of the face. Pain of all

No. 9.

kinds, anguish, agony, care, wrinkle the forehead from temple to temple. Thought and passion crease it perpendicularly between the brows. All these outward manifestations of the internal conflict that goes on in every one of us from day to day are, to some extent, within the control of our will, but they do not yield one iota to all cosmetics in the world. You have a certain feeling, and your face takes on certain lines, and in proportion to the recurrence of that feeling those lines deepen. But you may, by the exercise of your will-power, keep that feeling in check to a certain extent, and to a certain extent also control the lines of your face. This is all the preventive or cosmetic that there is for wrinkles. So save the money you have put aside for any other so-called cure of them, and use it for a better purpose. There can be no real and lasting beauty without truth. Try to be true to a noble ideal all through. This is the foundation, the corner stone of true beauty. An attractive face is not a made-up one, it is the face of one on good terms with his or her own soul. Yes, that is the grand secret of all efficacious cosmetics for the face. Be on good terms with your own soul; and secondly, treat your body with all the respect and reverence that are due to the temple of the soul.—*Howard Glyndon, in Domestic Monthly.*

TIT FOR TAT.—When Lord Stratford was ambassador at Constantinople, one of the secretaries had an audience with the Sheikh ul Islam, who, at the moment of his visitor's entrance, was engaged in the performance of his devotions. The secretary sat down while the devotee finished prayers, which were ended by an invocation to Allah to forgive a suppliant true believer the sin of holding direct intercourse with a giaour. His conscience thus relieved, the old mufti rose from his knees and smilingly welcomed his guest. But this guest, who



No. 10.

was a great original in his turn, begged permission to perform his devotions. He gravely went through an Arabic formula, and ended by begging Allah to forgive a good Christian the crime of visiting a "faithless dog of an infidel." The astonished old mufti was nettled, but with true Oriental imperturbability he bore the insult.

CONDUCTED BY EMILY MAPLE.

INVALIDS—CHAPTER 1.

MARY BEAL M'LOUTH.

I HAVE often wished that those who are capable would take up the pen in rebellion against so much doctoring; but as all seem disposed to let others do as they please, I can only use my influence by noting a little of my experience. This, together with the conclusions drawn from observations, can be my only excuse for attempting to take up a subject, which only a *physician* of talents could handle successfully. I well know when the physical strength is weak, that most people prefer trying half a dozen kinds of patent medicines, calling in two or three physicians, or, mayhap, going to bed and doing nothing, to exertion of any kind. If a worker, the latter may do as much good as anything, but if most of your time has been spent upon the lounge, with a novel for company, and you have gained a listless feeling, that you don't want to work, and you *wont* work, because you don't have to; then exercise is what you need. I do not think ladies spend enough time in the open air. Those who feel the heat or are not accustomed to work, should not go out for the first time on a July day when the thermometer and the feelings indicate that the heat is intense; but begin in the spring as soon as the weather will permit to walk, morning and evening, slowly at first, but with shoulders thrown back and head erect, and walk until tired. The next day walk a little farther, and continue this until able to walk several miles. I do not know of anything that is better for nervous people, and if they walk until moderately tired they are always assured of a good night's sleep.

This, of course, does not apply to the laboring class, who are perhaps already too tired to sleep at all. To these I would say: Make some arrangement whereby you may be able to spend more time out-of-doors. Thoroughly air your sleeping rooms every day, and if they are small and occupied by more than one, have a window open at night. Do not have on any more bedding than possible, and above all things, do not sleep on a feather bed: they are so weakening, and cotton mattrasses made with perhaps five or six pounds of cotton and covered with calico, on top of a good straw bed or spring mattrass, are much better. Notice when you sleep too warm what a faint, all-gone sensation you have on rising in the morning. If you wish a tonic, instead of taking a hot sling or those accustomed bitters, eat a whole or even a part of a lemon before breakfast, every morning for a week or so, as the case may need.

Of course, there are times when medicine is a necessary evil, but generally if one is able to sit up, eating small rations and the plainest of food, taking moderate exercise and an abundance of sleep, will do much towards aiding the recovery. The "Yankees," as a people, bring on many of their ailments by irregular eating and sleeping, either eating too much, or, if they eat but little, it must be of the richest kind. I never found a family yet, that did not claim *they* lived *very* plainly, so perhaps my readers will not understand the meaning I attach to the expression, without further explanation. For a broth the grease should all be skimmed off. Apples or small fruits sweetened enough to be palatable, are much better than preserves of any kind, and a sweet apple baked is the most wholesome of all. A potato, baked with the least amount of butter possible to give it a flavor, half an orange, a taste of peach or pear, or a few grapes, with perhaps half a cup of tea, if the patient desires it, are sufficient for a breakfast. A slice of bread toasted, with a sprinkle of salt, and an egg broken in a basin of boiling water and cooked until the white is just done, will make a hearty dinner. For tea a Graham gem, with a piece of butter half an inch square, and a baked apple ought to be sufficient, with perhaps a very little of something to drink—tea, crushed coffee, or water. I nearly cured dyspepsia in my own case, by not drinking anything at the table.

A person with fever of any description should not drink milk. Lemonade, or a little jelly put in water, is a good drink in fevers. Never take a patient more than he ought to eat—for fear he may think you impolite or stingy, even if he *is* your guest. Having everything cooked nicely, and put on the plate nicely and carefully (and not thrown on), will do much towards making it look inviting and palatable. Step carefully, and noiselessly, and move about the bed slowly, not jerking the bedding or jarring the bed, or doing anything to make the patient nervous. Those who have been sick themselves a good deal, know best how to treat the sick; but be as careful with an invalid as you would with an infant who is weak and helpless. Never accept of any medicine which will prevent you using water free-

There is not anything more soothing to a person, confined to the bed, than bathing him with the hand with water, the temperature to suit the comfort of the patient. Do not undress or uncover the whole body at one time. Never eat for two hours before, or half an hour after bathing, or until thoroughly warm. *Never* refuse a patient a drink of water, but give him only one or two swallows at a time. Always keep the feet warm, either with drafts or hot bricks. When recovering, exercise enough to keep the blood in good circulation. Every one ought to study physiology, and make his own peculiarities and the human system a study, so as to be able to care for himself and so prevent many diseases which are brought on by intemperate habits. I have known several who have been taking medicine for years, and the more they take the more they need; for, when the effect of the drug passes off, it leaves them worse than before—cause and effect increasing until the drug finds lodgment in every tissue of the physical frame, and shows the effect as perceptibly as it does with one who drinks whisky, eats opium, or uses tobacco. If the *disease* has left, the poisonous drug is in the system, which keeps it very much out of order, and the easier way is to avoid getting sick. This can many times be done by proper living. You can do much towards throwing off a cold, by not eating more than once a day and then lightly. In short, starve it out; drink freely of water, and, if feverish, bathe often; but if cold, go to bed and cover warmly until you are better. Out-door employment is a change and gives one something to occupy the mind besides the dull routine of housework. Do not say you cannot get the time—but let me tell you in my next several ways to gain time.

DOMESTIC RECIPES.

English Mixed Pickles.

One-half peck of small green tomatoes; three dozen small cucumbers; two heads of cauliflower; one-half peck of tender string beans; six bunches of celery; six green peppers, and a quart of small, white onions. Chop the vegetables quite fine, sprinkle with salt and let stand over night. To six or seven quarts of vinegar add an ounce each of ground cloves, allspice and pepper, two ounces of turmeric and one-fourth pound of mustard seed. Let the vinegar and spice come to a boil, put in the vegetables, and scald until tender and a little yellow.

Iced Coffee.

Make more coffee than you are in the habit of doing for breakfast. Add to it about one-third as much boiling milk as you have coffee, and set away to cool. Place on ice and serve for dinner or tea, with lump sugar and cracked ice in each tumbler. MARY B.

Fried Cucumbers.

Pare, cut into lengthwise pieces a quarter of an inch thick and lay in cold or ice-water half an hour. Take out, wipe with a napkin, season with pepper and salt, dredge with flour and fry to a light brown.

Green Corn Pudding.

One quart of milk; three beaten eggs; one dozen ears of corn grated; one tablespoonful each of butter and sugar, and a little salt. bake in a covered pudding dish one hour.

MRS. E. L.

QUESTIONS ANSWERED.

Canary Bird. — We have never known a canary to pull out its feathers. Your bird may be molting and you mistake its cleansing itself by shaking and picking for plucking its feathers. Keep the bird out of all draft, give cuttle-fish, sand and daily bath, do away with all fancy food and feed only rape and canary seed.

Mr. James Brooks.—Communication received but you have omitted your address.

News of the Week.

MISCELLANEOUS.

Monday, July 21, 1879.

Minneapolis, St. Paul, and the whole State of Minnesota are greatly incensed because Chicago capitalists have got hold of their railroads and are running them in opposition to local interests. Not only have they secured the roads leading to Chicago and those in Southern Minnesota, but they are also trying to shut the wheat growers of the State from Lake Superior, with its cheap water route to the East. The North Wisconsin road has been bought for this purpose and, more recently, the St. Paul and Duluth. There is considerable fear that Chicago will capture the rest of the State's railroads, and an active organization of Minnesota business men is at work to prevent it. The monopoly already formed is so grasping that it costs as much to carry a bushel of wheat 26 miles from Farmington, Minn., to St. Paul as to send it 500 miles to Chicago. and it is estimated that it takes nearly $5,000,000 annually from the price of Minnesota wheat and adds several millions to the cost of the State's imports. Minnesota means fight and, having already organized a commercial league has summoned the strong men of the State to meet at St. Paul next Tuesday to see what ought to be done. A tailed boy has been discovered at Cincinnati, by the name of George Rehn. He has reached the age of four years, while the tail has attained a length of 14 inches, being covered with silky, glossy hair. It is where the tail ought to be, and, so far from being outgrown, promises to outgrow the boy. The surgeons find it is regularly articulated to the backbone, and don't think it safe to take it off. Why should they? Especially since the boy finds it a considerable help in gaining an upright position, like the kangaroo's tail. Is he Darwin's missing link between man and the monkey?

Virginia needs some energetic detectives to arrest her criminals. Three women and one man have recently been murdered and the murderers are still at large. One of them, Lewis White, the negro who murdered James Law, was last seen at Savageville, boasting that he was waiting for an opportunity to kill two negro women, the only witnesses to the deed.

The Legislature of this State at its last session passed an act reducing the legal rate of interest from seven to six per cent. The penalties for usury were left as they stood in the Revised Statutes, and a question has been raised what the effect of the change is. The Mutual Life Insurance Company has published a legal opinion furnished by its solicitor, Mr. O. H. Palmer, which shows that the Legislature has introduced great confusion into the subject. The act just passed follows the section of the Revised Statutes relating to interest, merely changing the rate, but provides that no contract made before "the passage of this act" shall be affected by it. By another section it is provided that the act "shall take effect on the first day of January, 1880." The act was passed, of course, on the day it was signed by the Governor; and the first question arising under it is: What is the effect of the law on contracts between the date of passage and January 1, 1880? The answer seems to be that loans at seven per cent. may still be made until that date. The second question is, What penalties, if any, exist for the violation of this law? The penalties in the existing law are all against the taking of interest above seven per cent., and the only change made is in the *rate*. The penalties were all made to attach to the old rate, and the question is whether the change in the rate changes the penal enactment. The statute as it now stands seems to be open to this singular interpretation, that after January 1, 1880, the legal rate of interest will be six per cent., but that there will be no penalty for usury unless more than seven is charged. That is, any rate between six and seven is illegal, while at the same time no punishment for taking it will be enforceable.

Sojourner Truth is renewing her youth in her 104th year and proposes to leave her Michigan home to see the results of the exodus in Kansas, lecturing on the way to pay expenses. Kentucky is setting some States of better repute an example of how gentlemen should conduct a political campaign. Dr. Blackburn and Col Evans, the democratic and republican candidates for governor, went on the hustings in courteous discussion, and the doctor shares his private conveyance with his rival in going from one appointment to another The statesment comes from Washington that the female Jenks, smartest of all Louisiana liars, holds an $1800 sinecure position in the Treasury Department.

George Lewis, a negro 19 years old, who murdered his grandmother in January last in Chesfield county, Va., and was sentenced to be hanged, having obtained a new trial, was again arraigned Monday. The jury, much against the prisoner's wish and the protest of his counsel, was composed entirely of negroes, and is the first of that kind empaneled in Virginia to try a capital offense. The testimony at this trial is much stronger than at the first, as the prisoner's confession, showing premeditated murder, was admitted as evidence, but the jury, after an hour's deliberation, returned a verdict of murder in the second degree, and fixed the punishment at 19 years in the penitentiary. This verdict against the evidence, is held to be a proof of the good reason the Virginia judges had for excluding negroes from the jury box.

Public announcement was made last week that the Government engineer inspecting the Mississippi jetties had certified the existence of a channel whose central depth between them is thirty feet and at the head of the passes twenty-six feet. This means the completion of the great enterprise, though not, we suppose, the cessation of dredging to keep the channel clear of lumps; and it is still too early to settle the original question in dispute between Captain Eads and the U. S. engineers about the re-formation of the bar and the consequent necessity of indefinitely extending the jetties. Should this contingency arise, however, we may hope that we shall already have found our profit in the temporary relief to commerce, as well as be able to overcome at a less expense any renewal of the obstacles to navigation. The moral and political consequences of Captain Eads's success are visible in a closer union of feeling and interest between the interior section and that lying along the lower Mississippi and the Gulf, and in numerous ill-considered schemes of internal improvement, partially staved off in Congress, in which the Mississippi occupies the first place, and in which Captain Eads is greatly relied upon. In other words, we might say that the jetties have contributed their share to the "nationalizing" of the Government, just as the yellow fever has done; the South, by a sort of poetic justice, being the chief agent in both cases.

The New York chamber of commerce has been collecting information about the railroad aid extended by local municipalities of the State, and it is found that the total county, town and village bonds issued for this purpose amount to $30,978,000. The bonds outstanding for other purpose amounted to $11,487,000, so that three-fourths of the bonded debt incurred by rural municipalities appears to have been for railroads. The cities are excluded from this calculation; were they included, the aid extended to railroads would be found to be about one-fifth the total local indebtedness within the State.

Shortly after the first alarming reports of yellow fever at Memphis, Tenn., the disease seemed to disappear from the place; most of the fugitive inhabitants returned, the quarantine established by other cities was raised, the authorities who had proclaimed the presence of the plague, were duly vilified and an era of business prosperity appeared on the eve of setting in. Early in the past week, however, the fever once more made its dread appearance, and cases of it have become alarmingly numerous. The inhabitants are again abandoning their homes for dear life's sake; those who have means are leaving their houses in charge of colored servants; merchants are removing their goods to St. Louis and other safer markets, quarantine has been re-established on every side, the municipal authorities are sending off the poor, and a complete panic prevails. Other places in the South are still reported free of the scourge.

The total number of publications in the United States, at the rate of increase during the past six months, will be 10,000 within a year. When we consider that this is only one for every 4,500 people, the country will not be too much enlightened for some time to come. The United States war vessel Wachusetts, engaged in enlisting boys for the navy, arrived at New Orleans, Monday. A crowd of candidates for the navy, with their relatives and friends, while waiting on the Wachusetts' boats, were precipitated into the water, Thursday, by the sinking of the wharf. A hundred persons, including many ladies, went down into the water, which was fifteen feet deep, but all were rescued.

Secretary Sherman is enjoying experiences the spectacle of which must make the public financiers of the European despots pale with envy. His estimates of the receipts for the fiscal year which has just expired have been exceeded by $9,500,000. The customs have brought in $4,500,000 more than he expected, which is considered a sign of growing prosperity, but which to many people means that the American people is once more plunging into a course of unbridled luxury, and contracting debts to the foreigner which will some day cause the sale of their houses and lands at auction for a mere trifle. The internal revenue has decreased by about $2,000,000, owing to the proposal in Congress to reduce the tax on those old friends of the politician, whisky and tobacco, which caused the distillers and tobacconists to hang back from the market. Congress did reduce the tax on manufactured tobacco from twenty-four to sixteen cents a pound. There was a gain from miscellaneous sources of over $6,000,000, but this consisted largely of profits on the coinage of silver, and therefore as long as the silver lies in the Treasury is not realized in fact. In considering the increase in receipts, the net surplus for the year being $7,946,664, it must be remembered that the expenses were increased by the payment of $5,500,000 on account of the Fisheries Award, the same amount on account of arrears of pensions, and $1,800,000 paid to Captain Eads for the improvement of the mouth of the Mississippi. No government in the world can exhibit such a magnificent basis of credit as the tax-paying powers of this people supply, and, in fact, their credit has nothing to fear from any quarter but Congress itself.

At a meeting of the receivers, shippers and millers, held lately in Chicago, the following grades of winter wheat were adopted:

No. 1 white winter wheat shall be pure white winter wheat, sound, plump and well cleaned.

No. 2 white winter wheat shall be pure white winter wheat, sound and nearly clean.

No. 1 amber wheat shall be pure amber winter wheat, sound, plump and well cleaned.

No. 2 amber wheat shall be of the same color and variety as No. 1 sound and reasonably clean.

No. 1 long red winter wheat shall be pure red winter wheat of the long-berried varieties, sound, plump, and well cleaned.

No. 2 long red winter wheat shall be of the same varieties as No. 1, sound and reasonably clean.

No. 1 red winter wheat shall be pure red winter wheat of both light and dark colors, of the shorter-berried varieties; sound, plump and well cleaned.

No. 2 red winter wheat shall be of the same varieties as No. 1, sound and reasonably clean.

No. 2 winter wheat shall include all Northern grown winter wheat and all mixtures of the various descriptions of winter wheat, and shall be sound, reasonably clean, and of good milling quality.

No. 3 winter wheat shall include winter wheat not clean and plump enough for No. 2, and weighing not less than fifty-four pounds to the measured bushel.

Rejected winter wheat shall include winter wheat damp, musty, or from any cause so badly damaged as to rendered it unfit for No. 3.

The State of Maryland, with 4,000,000 acres of uncultivated land and 1,000,000 acres of wild pasturage, has only 151,200 sheep. The reason as given for this state of things is that 7 per cent. of the sheep are annually killed by dogs. The entire South has less than 7,000,000 sheep, and of these 500,000 are said to be destroyed by dogs. Yet the South has summer pasturage and winter keep for from 70,000,000 to 100,000,000 sheep, if rightly managed. A statute law of Illinois requires farmers and others to keep their hedges trimmed down to a hight of four and a half feet. The law is very little regarded. This year's peach crop in the Delaware, New Jersey and Maryland district is estimated at from four to five million baskets.

FOREIGN.

In Great Britain the present agricultural depression is the chief topic of discussion, not merely in country places, but also in Parliament, the cities and the public press. Interest in it transcends that in the Zulu war or even that in the doings of Sara Bernhardt. Although the crops are almost ruined by a backward season and much rain, yet prices of grain are still comparatively low. This is due altogether to the enormous quantities which are received at the various ports, or are on their way thither. Our latest mail advices are ten or eleven days old. At that time the amount of wheat in passage exceeded that at the same date last year by 3,200,000 bushels; and while the de-

liveries of English grain amounted to only between 16,000 and 48,000 bushels a day, those of foreign grain were ten times as heavy. Then the jealousy and competition between importers or sellers is exceedingly bitter, much more so than that between buyers, and this leads them to sell at the lowest possible figure rather than run the risk of being undersold by their rivals.

American wheat holders feared to be undersold by Russian wheat holders, and white wheat from California was sold at a low figure lest white wheat from Australia and New Zealand should forestall it in the market. Of the wheat on passage, about three-quarters were red to a quarter white. The quantity on passage from Australia was large, as was that from Chili. From California there were at sea 4,640,000 bushels.

During the first six months of the present year one thousand grain ships passed the Dardanelles with Russian wheat chiefly; of these, 70 only had Great Britain for their direct destination. For Malta and Gibraltar 150 vessels sailed, and if we give England two-thirds of these, we have 170 ships taken by English and 850 by Continental demand. France has been the leading purchaser, Marseilles alone taking 450 cargoes. Italy has taken 80 cargoes, the Netherlands (Holland and Belgium) 50, the Iberian Peninsula 38, all direct; of some 120 cargoes, with a general Mediterranean and Adriatic destination. It may be assumed that France has taken about two-thirds and Italy the greater part of the remaining third. The proportion of wheat cargoes has been very large, about five wheat cargoes to one of other grain staples.

The imports of maize or Indian corn, nearly altogether from this country, were very large, amounting during the week to 3,741,818 bushels, while 5,880,000 bushels were afloat on the way thither. If the confident expectations with regard to the ruin of the hay crop are realized, it is thought that the exportations of corn will be exceptionally heavy this year, as much of it will be used as cattle feed.

Prince Napoleon made his last will and testament at Chiselhurst on February 26, 1879, preparatory to going to Zululand. In it he declares that he dies in the Roman Catholic faith, and desires that his remains may be placed by the side of his father's. He declares that his last thoughts shall be for his country; that his love for his friends, servants and partisans will only end with his life; that he shall die with a feeling of deep gratitude to the Queen of England and all the royal family, and hopes that his mother will preserve the same loving memory of him that he shall ever cherish for her while he enjoys life. He bequeaths 100,000 francs each to M. F. Pietri, M. LeBaron Corvisart, Mlle. de Larminat for her attachment to his mother, M. A. Filon, a former tutor, M. L. N. Conneau, M. N. Espinnasse, and Captain A. Bizot, who were three of his oldest friends. He gave 20,000 francs to his cousin Prince J. N. Murat; an annuity of 10,000 to Prince L. L. Bonaparte; an annuity of 10,000 to Mr. Bachon, and annuities of 2,500 each to Mme. Thierry and Uhlmann. All his servants he desired should never be deprived of their salaries. His jewelry, uniforms and weapons he disposes of to a number of personal friends. He constituted his mother his universal legatee, subject to the payment of the legacies above, and appointed M. M. Rouher and F. Pietri his executors.

Prince Jerome Napoleon Bonaparte has at last been declared head of the family, much, the cablegram assures us, to his satisfaction. While attending the funeral of his nephew a message was sent him from the ex-Empress Eugenie that she would receive him after the ceremony. He returned to France, however, without accepting the invitation. As he is now, according to the opinion of his adherents, Emperor of the French, it is presumed that he thought it was his place, rather than the dowager Empress's, to concede an interview. The slight, however, has lost him many friends, or rather has prevented many followers of the late Emperor and his son from becoming supporters of the new claimant. M. Rouher, the ablest of the Bonapartists, has declared that he will take no more part in political life. The Orleans family has held a meeting at Geneva, to take into consideration the influence the death of young Napoleon may have upon their fortunes; while the Count de Chamford, head of the Legitimists, has advised his followers to open their arms to any supporters of the late Empire who may now be willing to join their ranks. This is supposed to be a bid for the "clericals," most of whom have hitherto been Bonapartists, but who are very unlikely to continue in that party now that it is headed by Pion-Pion, who has always declared himself to be the uncompromising enemy of "priestcraft."

A bill regulating education in France, introduced into the Assembly by Jules Ferry, Minister of Education and Public Worship, has just been passed by that body by a vote of 363 against 106, but is likely to be defeated in the Senate. At present the Jesuit schools and colleges in France are among the foremost in that country or in Europe and the order also controls three Universities lately established. The proposed bill takes all educational matters entirely out of their hands, and makes education a State affair. Of course, such a measure arouses bitter opposition on the part of the "clericals" and their adherents.

To an American named Grower has been accorded the honor, and privilege, of erecting telephone lines in Paris. He will use improved instruments of his own invention, the departure from the Bell patent consisting of a novel form of magnet of great strength, by use of which the volume of sound is greatly increased. No battery will be used. In the British House of Lords the Marquis of Huntley, Thursday evening, complained of the railway companies for carrying American meats at lower rates than English, because of the larger quantities in which the former was sent. He pointed out that such action was a protection for American farmers, and asked whether the matter had been brought to the attention of the board of trade and the commission on agricultural depression. The Duke of Richmond, lord president of the council, replied that the granting of preferential rates was a violation of law, but Lord Selburne doubted it.

As an example of the low prices of butter and cheese which at present obtain on the other side, we may mention an auction sale which occurred in Liverpool on June 24th last, when a lot of cheese shipped from Montreal was offered to the highest bidder, but only a few boxes were sold at 20s. to 28s. per cwt. American creamery butter was also put up for sale, part of which only realized 65s. per cwt., the rest being withdrawn. Another lot of fine creamery was also offered, but as 70s. was the best bid, very little was disposed of. Inferior cheese was auctioned off as low as 15s. and 16s. per cwt. Of course, it must be borne in mind that the above were forced sales, but part of the goods offered was fine, and such transactions frequently establish values in Liverpool, where auction sales are of regular occurrence once or twice a week.

How to tell Genuine Florida Water.—The true Florida Water always comes with a little pamphlet wrapped around each bottle, and in the paper of this pamphlet are the words "Lanman & Kemp, New York," water-marked, or stamped in pale, transparent letters. Hold a leaf up to the light, and if genuine, you will see the above words. Do not buy if the words are not there, because it is not the real article. The water-mark letters may be very pale, but by looking closely against the light, you cannot fail to see them.

Remember Hop Bitters never does harm to the smallest child, but good, always and continually.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 19, 1879.

BEANS AND PEAS.—This market is apt to be a silent one in summer, and this season is no exception. Selling rates generally at the inside figures. Red Kidneys lower. Beans, marrow, prime, $1.30@1.32½; fair to good, $1.25@1.30; medium, prime, $1.30@1.32½; fair to good, $1.22½@1.27½; pea, choice, $1.30@1.32½; fair to good, $1.20@1.25; white kidney, choice, $1.32½@1.35; fair to good, $1.25@1.30; do., red, prime, $2; fair to good, $2.35@2.40; turtle soup, $2.25@2.30. Peas, green, per bush., $1.90@2; Southern B. E. per 2 bush. bag, $2.55@3.00; Canadian, in bulk and bond, per bush., 70c.

Exports for the week, 1,729 bbls. beans; receipts, 2,200 bush.

BEESWAX.—There is rather an easy market, with 24c. quoted.

BROOM CORN—Has a very fair sale and is steadily held.

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Receipts for week, 34,500; exports, 8,000 packages, divided about equally between England and the Continent. This summer is a noticeable one in the absence of New York's regular line of companies, and the market feels the curtailed demand to a marked degree. The light trade, however, is steady and prices are well sustained, though in that connection no one ought to expect cheaper rates than have ruled this season. State, at the prices, pushes Western aside. Selections ½c. higher than at our last. Butter merchants have had some severe hot weather to contend against. Quality, however, has not suffered so seriously this summer as in former hot seasons. Methods of storing in cold cellars have been perfected so that unsold lots can be kept safely with the assurance of turning out well. This is one reason why summer made stock should be sent right along. It had better have spot chance of sale than to be held till autumn to hurt the average quality of dairies.

State pails and half tubs, choice, 13½@14c.; good to prime, 12@13c.; fair to good, 10@12c.; firkins, choice yellow, 14½@15c.; fair to good, 13@14c.; Welsh tubs, choice, 13@13½c.; good to prime, 12@13c.; fair to good, 10@12c.; poor, 8@9c.; State creamery, best invoices, 15½@16c.; good to prime, 14@15c.; sweet cream, best, 15@15c.; fair to good, 13½@14c.; Western, best invoices, 15½@16c.; good to prime, 14½@15c.; fair to good, 13½@14½c.; imitation creamery, 9@12c.; Western dairy, best invoices, 11@12c.; good to prime, 9½@10c.; fair to good, 8½@9½c.; poor to fair, 7½@8½c.; Western, factory, best invoices, 9½c.; good to prime, 8@9c.; fair to good, 7½@8c.; poor to fair, 7@7½c.; grease butter, 3½@4½c.

CHEESE.—After ruling strong early in the week at 6¾c. and even 6¾c. for some lots, the market towards the close has become weak through the easier Liverpool market, and closed with sales very rare over 6¾c.

Quotations are for State factory: Fine, 6½@6¾c.; good to prime 5½@6c.; fair to good, 4¾@5¾c.; half-skimmed, 4@5c.; skimmed, 2½@3½c.; State farm dairy; Fine, 6@6½c.; good to prime, 5@5¾c.; fair to good, 4@5c.; skimmed, 3½@3¾c. Wisconsin factory: Fine, 6¼@6½c.; good to prime, 5@6c. Ohio factory: Cheddar, fine, 6½@6c.; do., fair to good, 4½@5½c.; full cream, flat, fine, 6@6½c.; flat, good to prime, 4¾@5¾c.; flat, fair to good, 4@4¼c.; half-skimmed, 3@4c.; skimmed, 2½@3c.

COTTON—Has been been pressed for sale at a decline without leading to much activity, prices are for July, 11.30@11.31c.; August, 11.36@11.36c.; September, 11,31@11.35c.; October, 11.18@11.19c.; November, 10.86@10.87c.; December, 10.84@10.85c.; January, 10.88@10.90c.; February, 10.93@10.97c; March, 11.08@11.12c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples are moving out slowly, with prices easy. Peaches are dull and unchanged. Small fruits are quiet.

Apples—Evaporated Aldon's and Williams's at 10½@11c.; do., new process, at 8½@9c.; State plums, 8@10c. Blackberries quoted at 4½@5c. Peaches—Peeled Georgia, 5@6c. for poor; 6@7c. for fair to good; 8@9c. for prime; choice North Carolina, 9@10c.; good do., 7½@8½c.; unpeeled halves, 3@3½c.; quarters, 3c. Apples—New, 2½@2½c. for Southern quarters in bags; 2½@3½c. for sliced; State, 3@3½c. for new sliced, and 3@3½c. for quarters; Western, 2½c. for new quarters.

EGGS.—Receipts for week, 7,220 bbls.; do., last week, 5,524 do. The market has ruled weak during very hot weather, but shows some recovery at the close.

Near points, 15c.; State and Penn., 13½@14c.; Western, best, 12¼@13c.; others, 11½@12c.; Canadian, 11½@12c.

FLOUR.—With large receipts and lower wheat values prices have declined.

Latest prices are: $3.85@4.15 for inferior to very choice superfine State; $4.20@4.50 for poor to good extra do., odd lots and lines; $4.50@4.75 for good to choice do.; $3.85@4.15 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $4.20@4.50 for inferior to good shipping extra do., and $4.50@4.75 for good to choice extra do.; common to choice white wheat extras, $5.00@6.10; choice to fancy do. at $6.10@6.75; red and amber winter wheat, inferior to very choice trade and family, at $4.85@6.25; round hoop Ohio at $4.40@4.75, and trade and family brands of do. at $4.85@6.00, the latter rate for strictly choice; St. Louis, $5.00@6.00 for inferior to good extra; $6.00@6.75 for very good to very choice (with fancy brands held higher); Minnesota clear, inferior to fancy, at $4.25@5.50; Minnesota "straight," very inferior to strictly fancy, $5.00@6.50, and patent poor to very choice at $5.50@8.00 (with a few fancy brands quoted at higher figures); unsound stock at from $2.35@3.25; city mill extra at $5.40@5.75, good to to very choice, for West Indies; do. for England, $4.25@4.75; do. trade and family extras, $5.75@6.75; do. for South America, $5.50@5.75 for standard choice brands (winter wheat product); No. 2 at $2.50@3.35 for poor to strictly fancy.

CORN MEAL—Is selling at $2.65@2.70 for Brandywine and $2.00@2.35 for Western yellow.

FRESH FRUITS.—Supplies of seasonable items liberal and quality generally fine. The latter feature, with the easy prices, has kept trade active. California has begun to send pears and plums. Several car-loads have been opened during the week. First price for pears, including Bartletts, was $———; afterwards they went down to $———. Plums quoted ———. Estimates of the peach crop are not thought to be excessive when 5,000,000 baskets are approximated. Preparation has been made to ship 3,700,000 baskets, two and a half millions by rail and the rest by water. An immense canning and patent drying business will occur this season. The Western crop is called light, and a brisk market for cases of cans is expected. It is estimated at growing points that nearly one million baskets will be used by wholesale preservers.

Apples, red Astrachan, choice, ₱ bu. crate, $1@1.25; common, 75c.; early harvest, Southern, choice, 75c.@$1; Sour Bough, Jersey, ₱ bbl., $1.50@2.50; Sweet Bough, do., $1.50@2. Pears, Southern Bell, ₱ bbl., $3.50@5; Jargonelle, $4@5; Bartlett, Sny, green, ₱ bush. crate, $2@2.50; cooking, ₱ bbl., $2@3. Currants, cherry, ₱ lb, 7@10c; small, fair to good, 6@7c.; black, 5@7c. Whortleberries, Md. & Del., fair to good, per qt., 5@6c.; Jersey, do., per 14 qt. box, 75c.@$1; mountain, 87c.@$1.12. Blackberries, Monmouth Co., Wilson, ₱ qt., 8@10c.; South Jersey, do., 7@9c.; Md. & Del., 6@8c. Raspberries, up-river, Antwerp, per 3 to qt. cups, 3½@4c.; do., native, 2@2½c.; Md. and Del. Brandywine, per pint, 4@5c. Watermelons, Geo., per 100, $30@35; N. C., $10@20; Fla., $15@25. Nutmegmelons, Jenny Lind, Norfolk, ₱ bul., $2@2.50; cantaloupe, do., $1.75@2. Peaches, Georgia, choice, ₱ bush., $3@5; N. C., do., $2@3; common, $1@1.50; Md. and Del., good, ₱ crate, $1.50@1.75; poor, 75c.@$1.25. Plums, beach, Del., ₱ bush., $1@1.50. Hot-house grapes, B. Hamburgh and Muscat, 75c.; Sweet Water, 30@40c. For peanuts there is a fair shipping demand; Va. hand-picked, $1.40@1.45; fancy, $1.20@1.25; extra prime, $1.25@1.27½; good to prime, $1.15@1.20; shelled, 5½@5¾c.

GRAIN.—Wheat has declined steadily on the better weather reports from the other side, with trade fair. Sales of No. 1 white at $1.16; do. August, at $1.12 do. July, $1.16; No. 2 white at $1.14; ungraded white at $1.14; No. 2 red, July option, at $1.12½@1.12¾; do. August, at $1.10@1.11; do. September, at $1.10¾@1.11; ungraded red at $1.10@1.13; No. 1 amber at $1.14@1.14½; No. 2 do. at $1.12½@1.13; do., July option, at $1.11¾@1.12; do. Aug., at $1.09@; ungraded amber at $1.11@1.13; No. 2 spring at $1.08@1.10; No. 2 Northwest spring, July, at $1.07; No. 3 spring at 98c.@$1; ungraded spring at 96c.@$1.02; rejected spring at 88@92c.; Rye is in demand, at 66@67c. for Canada and State, and 64c. for No. 2 Western. Corn is easy at a decline on full offerings; sales of New York No. 2 at 44¾@44¾c.; do. for July at 44½c.; do. August at 45c.; do. September, 46c.; New York steamer mixed nominal, July at 44¼c. bid and 44¾c.; August, 44c. bid and 44¾ asked; September at 46c. bid and 45¾c. asked; No. 3 nominal; ungraded Western mixed at 43½@44c.; New York yellow at 46c. Oats are lower and dull; sales of New York No. 1 white at 42¾c.; New York No. 2 white at 38@39½c.; New York No. 3 white at 38¾c.; No. 1 quoted at 38¾@39c.; No. 2 at 37½@38c.; No. 3 at 38¾c.; mixed Western at 37½@38c.; white do., at 40@41c.; white State at 42@45½c., No. 2 Milwaukee at 38c.

HAY AND STRAW.—The arrivals are large and there are free sellers.

New hay is selling at from 50c. to 70c., old hay at 40@45c. for shipping and 70@85c. for prime retail qualities. Straw at 50@55c. for long rye, 45c. for short rye, and oat at 30@40c.

HOPS.—Emmet Wellsian says in his weekly circular "A call from London this week for 1,400 bales of our hops, together with continued unfavorable crop accounts, has added new strength to our market and sent the price up 1c. per lb. on all descriptions. Present appearances do not give hope for a yield of much over 100,000 bales in America, and these will all be wanted for home consumption; but, of course, should prices run much higher in England than here, a few of our choice new hops may find their way over there, but it is rather early to speculate on the chances of an export trade; in fact, it looks more now as though we might become importers of hops next fall, and if so, Germany will be the only country we can look to for a supply.

	Bales.
Receipts for the week	2,365
Total receipts since September 1, 1878	80,039
Total receipts for same period in 1877	135,751
Export clearances for the week	1,411
Total exports since September 1, 1878	29,352
Total exports for same period in 1877	78,710

Quotations are for New York's, new crop, prime choice, 11@16; New York's, new crop, medium, 9@10; New York s, new crop, low to fair, 7@8; Eastern, 8@11; Western, 8@11; Yearlings, 4@7; Olds, all growths, 3@4. Pacific coast, nominal, 10@14.

OIL-CAKE.—Western is easy and quoted $29.00 per ton.

POULTRY AND GAME.—Live fowls scarce and firm; chickens lower.

Chickens, best, per lb., 17@18c.; small, 15@16c.. fowls, N. J., 13@13½c.; Western, 12@13c.; Southern 11½@12.; roosters, old, 6@7c.; turkeys, 9@11c.; ducks, spring, ₱ pair, 50@75c.; others, 40@70c.; geese, choice, $1.37@1.50; others, $1@1.25.

Fowls and turkeys, dressed for special summer trade, firm. Chickens have declined in sympathy with the large arrivals of coops.

Turkeys, Phila., dry-picked, 12@14c.; State and Western, prime, 11@13c.; chickens, Phila., large, ₱ lb, 24@25c.; Phila., small, 21@22c.; State, 17@19.; Western, 16@17c.; fowls, N. J., choice, ₱ lb., 13@14c.; State and Western, dry-picked, 12@16c.; scalded, 10@12c.; Phila. dry-picked, 14@15c.; ducks, spring, Phila. dry-picked, 16@18c. ₱ lb.; spring, small, 13@15c.; old, Phila., dry-picked, 10@13c.

A few fresh-killed English snipe quoted at $2@2.25; dry plover, $1.75@2; small snipe, 50@60c; stall-fed W. pigeons, $1.75; balted, $1.50; tame squab, $1.75.

PROVISIONS—Have been affected by the yellow fever reports, in the likelihood of a falling off in the demands from Southern points, and prices are much lower. Mess pork quoted for July at $8 65; August at $8 75; September at $8 90; October at $8 90@9 00. Bacon at 4¼@5c. for long clear and $5 25 for short clear. Lard—Western steam at 6c. for spot, 5 95@5 95¾ for July and August, $6 02½ for September, $6 07½@6 10 for October. Beef—Plain mess at $10 25@11 00; extra mess at $11.50@12; packet at $11@11 50; tierced beef, city extra India mess, at $18@20 50; Philadelphia at $17. Beef hams at $20. Tallow at 5 15-16@6c. for prime. Stearine at 6¾@6¾c.

TOBACCO.—There is not much being done, but holders' views are firm and prices unchanged.

VEGETABLES.—Potatoes are abundant and dull. It would be difficult to say when prices would drop, were it not for Havana shippers. All quoted, $1@1.50 per bbl., fair to good; 50c. for culls. Green stuff shows the usual fluctuation in buyers favor, which attends at this date of summer. Green corn, Hackensack, 50@70c. ₱ 100; Burlington, 25@40c. Cucumbers, L. I., ₱ 100, 20@40c. Tomatoes, L. I., near-by, ₱ crate, $1.25@1.50; Norfolk, ₱ bush. crate, 25@40c. Beans, L. I., wax, ₱ bag, 75c.@$1; do., round, 75c; do., flat, 50c. Squash, L. I., yellow, ₱ bbl., 75c@$1.00; do., white, 50@75c. do., Norf., marrow, $1. Green peas, L. I., per bag, $1@1.50. Cabbage, Early Wakefield, per 100, $1@2; Flat Dutch, $3@5. Onions, Va. and Md., per bbl., $4@4.50. Beets, Jersey, per 100 bunches, $1.50@2. Russia turnips, per bbl., 75c.@$1; Jersey, new, per 100 bunches, $1@2. Carrots, per 100 bchs., $1@1.50. Cauliflower, ₱ bbl., $1.50@4. N. J. egg plants, $2.50@3 per bbl.; onions, $3.50@4.

WOOL.—For medium grades there is more demand, yet as receipts accumulate prices are lower. Combing and delaine grades have not been inquired for materially, but prices are steady. The lack of demand for these wools has deterred many dealers from throwing them out, and the result may be a scarcity before next clip, unless, as some contend, the consumption is materially curtailed. Manufacturers are now sufficiently stocked, so that, with liberal supplies to draw from, they will, during the next few weeks, probably test the strength of holders by meager buying. Quotations:

Ohio, Pennsylvania and Virginia—XXX and picklock, 40@42c.; XX, 37@40c.; X, 36@38c.; No. 1, 37@40c.; No. 2, 35@36c.; common, 34@35c.; combing, nominal.

New York, Michigan, Indiana and Wisconsin—XX 32@34c.; X, 29@33c.; No. 1, 25@33c.; No. 2, 33@34c.; common, 31@33c.; combing, nominal.

Iowa, Vermont and Illinois—X and XX, 30@34c.; No. 1, 32@37c.; No. 2, 30@32c.; combing, nominal.

Missouri, Kentucky and Tennessee — Washed fleece, 35@39c.; unwashed fleece, 30@33c.; unwashed combing, nominal.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 19.

BEEVES.—Receipts for the week, 11,315 head; do. last week, 12,378 do. Sales have been brisk right along, a very steady and liberal demand keeping supplies down to a good selling limit. Fine steers sold at 10¼@10½c., to dress 57 lbs.; other natives ranged from 7¾c. up to 10c., to dress 56 lbs. A number of Cherokees direct from S. W. grazing sold low, 6¾@7¼c. The exports of cattle and quarters are extremely large; every steamer that would accept bullocks as freight could have a shipping customer. It is interesting to note that the number taken abroad during the week (about 3,500 head, including quarters) twenty years ago would have furnished the New York market. This outlet is of great value to sellers, especially in summer, when the city wants can be easily over-supplied.

COWS AND CALVES.—Supplies are quite large, and cows to exceed the range of $25@55 must have extra merit; $60 is regarded a big price.

VEAL CALVES—Abundant and low. Choice fed, 5¾@6c.; good to prime, 5@5¾c.; others, 3½@4½c.; buttermilk calves, 2½@3c.

SHEEP AND LAMBS.—Receipts for the week, 30,465 head; do. last week, 32,877 do. Market firmer, stock selling readily. Pens cleared at date. Common to good sheep, 3½@4¼c.; 4¾@5c. for prime, and 5¾ for extras. Lambs steady at 5@6c. for fair to good and 6½@7c. for prime to best, the latter for N. J.

HOGS.—Receipts for the week, 20,414 head; do. last week, 18,152 do. No sales alive at Fortieth street yards. Nominal price, 4@4½c. for Western; 4½@4¾c. for State; city dressed, $5.12@5.50 per 100.

Reading for the Young.

AMY'S BOTANICAL SCHOOL.

REV. HENRY S. CLUBB.

AMY was so fond of talking about flowers to her companions, and they became so interested, that it was at last arranged that they should meet regularly at a certain point in the woods, and after rambling about for two hours or so, gathering specimens, they would return to the place left and sit under the shade of a hemlock that had become familiar to them, and hold class meeting, with Amy for leader.

Having become interested in their proceedings we were invited to join their party, and will now give some idea of what occurred.

"The most attractive flower at this season," said Amy, when about a dozen of her young friends were seated around her on the white sand, is what?"

"The Trailing Arbutus," said several voices at once, for they had gathered handfuls of this beautiful spring flower, and some had decorated their hats and belts with it.

"What is the Latin name of this flower?"

"*Epigœa repens*," replied cousin Sue.

"What is the common American name?"

"The May-flower," said Jane Emlaw, "and it is also called the Ground Laurel."

"Where is it found besides on the Lake Shore region of Michigan?"

"It is very common in New England," said Jane Thompson, who formerly lived in the Connecticut Valley; "and it is found also in the hilly regions of Pennsylvania and Kentucky, but always near rivers or larger bodies of water. Never far from water. It grows near the foot of hills, where leaves and snow will cover it all winter."

"What is supposed to have originated this name?"

"The general belief in the East," said Jane, "is that it was first discovered by the pilgrims in the spring after their arrival, and as it was the first wild flower which specially attracted their admiration in the month of May, and as they had not forgotten the name of the vessel which had brought them safely over the ocean, they concluded to call it after the good ship 'Mayflower,' and so it has always been known by that name ever since."

"That is a very good explanation," said Amy. "What has since been proposed in regard to the May-flower?"

"When we visited the Centennial in Philadelphia, we heard it spoken of and saw it displayed as the 'national flower of America,'" said Flora Maxey. "And it has since been referred to as such in the papers."

"On what account has it been selected for this purpose?"

"Because, I suppose," said Flora, "it is so generally admired, and on account of its historic associations connected with the landing of the pilgrims, and is not found, as a wild flower, so common in any other country, if at all. It seems at home only in the wild woods of America."

"What are the habits of the Trailing Arbutus?"

"It has a shy way of hiding itself under the fallen forest leaves. That is, it seems to grow under leaves, and is ready to peep up almost as soon as the snow melts, having been kept warm all winter under this natural covering, so that it is kept ever green, and its pretty wax-like flowers even can often be found half buried in leaves. It grows in clumps on hill-sides and in shady nooks. Strangers to its habits often look for it and are unable to find it, but those who know its habits can find it readily."

"Have any of the poets of America noticed the Mayflower?"

"O, yes," said Ella Boynton, "I have seen a beautiful little poem in reference to it."

"Can you recite it?"

"I think Mary Field can," said Ella, "as I heard her recite it at the last school exhibition."

"Oh, yes, let us have it, Mary," said several voices at once.

Mary Field came rather timidly forward, but soon gained confidence; and, standing in the midst of this delightful circle recited, with a sweetly modulated voice, the following stanzas:

"Oft have I walked these woodland paths,
Without the blest foreknowing,
That underneath the withered leaves
The fairest buds were growing.

"To-day the south wind sweeps away
The faded autumn splendor,
And shows the sweet Arbutus flowers,
Spring's children pure and tender.

"Oh, prophet souls, with lips of bloom
Outvieing in their beauty
The pearly tints of ocean shells,
Ye teach me faith and duty!

"'Walk life's dark ways,' ye seem to say,
'With love's divine foreknowing,
That where man sees but withered leaves
'God sees the sweet flowers growing.'"

There was a general clapping of hands when Mary finished her pretty recitation, all the girls were pleased and Ella, who had hastily gathered up all the Trailing Arbutus flowers within her reach, tied them in a bunch and threw them towards Mary who gracefully caught them in her apron and bowing, withdrew to her place on the sand.

In this way several other wild flowers were discussed, the particulars of which, if reported, would constitute a complete lesson in the flora of the east shore of Lake Michigan.

The proceedings closed with a song by Emeline Fox, entitled—"The Vale of Cashmere."

Just as the fair singer came to these words:

"O, to see at the sunset, when warm o'er the lake
Its splendor at parting a summer eve throws,
Like a bride, full of blushes, when lingering to take
A last look of her mirror at night ere she goes!"

The cloud which had concealed the sun for some time from view, having risen a little above the horizon, displayed in all his splendor the sun just apparently about sinking into the blue waters of Lake Michigan. The girls all rose to their feet in order to get a better view. The gentle waves became illuminated, presenting the appearance of a sea of molten gold; the clouds in the east reflected back the bright vision, and all around was a rich glow of glorious sunlight. The distant school house could be seen and every square of glass gleamed with a light as of fire, while the village churches and prominent dwellings joined in the general illumination. As the song continued, all joined in as if receiving an inspiration from the radiance that surrounded them:

"Hills, cupolas, fountains, called forth every one
Out of darkness as they were just born of the sun."

And closing with the beautiful words:

"And day with its banner of radiance unfurled,
Shines in through the mountainous portal that opes
Sublime, from that valley of bliss to the world!"

"This reminds me," said Amy, "of Shelley's Sunset:

'If solitude hath ever led thy steps
To the wild ocean's echoing shore,
And thou hast lingered there
Until the sun's broad orb
Seemed resting on the burnished wave,
Thou must have marked the lines
Of purple gold, that motionless
Hung o'er the sinking sphere:
Thou must have marked the billowy clouds,
Edged with intolerable radiancy,
Towering like rocks of jet
Crowned with a diamond wreath.'"

After taking a parting glance at the lake and the dissolving view of sunset glory which it presented, Amy's botanical scholars skipped gaily down the hill and on reaching the village, separated to their respective homes each carrying their collection of specimens and feeling that the lesson and its accompanying fresh air, exercise, and delightful scenes had done them much good.

BUDDING.

ONE of the nicest and most interesting operations of the garden, which the members of the Horticultural Club can engage in at this season, is the budding of trees. Though it is a work that is peculiarly suited to boys, as it requires the use of that never-to-be-sufficiently-cherished and useful little implement, the pocket-knife, without which no boy can be perfectly happy, this operation can with equal propriety be performed by girls and young ladies who take an active interest in gardening. Many of the members, I doubt not, are already familiar with the process of budding, and could tell us all about it if they were asked to do so, but there are others who do not know how it is done, and for the benefit of these I will give a few brief directions in the art. Budding differs from grafting mainly in this, that in budding only a single bud is cut loose and inserted under the bark of another tree, while in grafting a young branch, or cion, having several buds is united to the stock. Both are modes of propagation used to increase such varieties of trees as cannot be raised true from seed. Trees thus propagated will also come into bearing sooner than seedlings, and have various other advantages.

WHAT TREES TO BUD.

All fruit trees can be propagated by budding, but it is found that the apple and pear tribe succeed best by grafting, while the stone fruits, that is Apricots, Peaches, Plums and the like, succeed best by budding. Roses, Lemons, Oranges, and a vast number of ornamental trees and shrubs are also budded.

Though there is thus a great number of varieties on which to practice, young peach trees will probably be the easiest to obtain. Generally a number of these can be found springing up about every garden and farm throughout the country.

Budding can only be done at the time of year when the bark will separate readily from the wood, and when buds of the current summer's growth are ripe enough to be used. This period continues from the beginning of July till the middle of September. Before you proceed to bud, you must be provided with the following

NECESSARY REQUISITES,

which are, first, the stocks or trees to be budded, which we will suppose are young seedling peach trees. They should be three-eighths to half an inch thick; larger ones can be used, but this is the most convenient size.

Secondly, you must be provided with buds. Take these from another peach tree, which you are satisfied bears good fruit and is worthy to be propagated. Cut off one of the strongest shoots of the present summer's growth, and from this select the largest and most thrifty-looking buds found on the lower half. Cut off the top of the shoot and all the leaves, leaving about one half of the leaf-stalk (petiole) of each leaf. The remaining stump of the leaf-stalk will serve as a handle for the bud just above it.

Thirdly, you must have a small, sharp knife. A good budding-knife can be bought in any well appointed hardware store and in most large seed stores. This is a knife made for the purpose, and has a small, thin and very sharp blade. The handle is about three and a half inches long, made of ivory and flattened, so that it can be pushed in under the bark. But in want of such a knife, a sharp pocket-knife will do, and to loosen the bark use the point of a paper-knife or a similar smooth and pointed piece of ivory or horn.

Lastly, you must also be provided with some strands of bast, about a foot long and a quarter to half an inch wide. Some soft woolen yarn may be used instead of bast. Thus equipped you are ready to begin

THE OPERATION.

On the north side of the stock, from two to eight inches above the ground, make a cut about an inch long lengthways through the bark, and at the upper end of this make a cross cut, so that the two cuts form a T, as seen at a, in the engraving. Next cut a bud loose from the stick of buds. Beginning three-eighths of an inch above the bud, make a smooth cut just deep enough to shave off a very thin piece of wood with the bud. The bud thus separated is seen at c. Then with the handle of the budding-knife open the corners of the cut bark on the stock, as represented at b, and insert the bud, pressing it down gently till it occupies the position shown at d; the bud pointing upward as before. Next, tie the bast about the wound. Place the middle of the band on the wound above the bud and wind both ends about the stock downwards and moderately tight: when tied, the bud will appear as shown at e, and the operation is done. In fourteen days you will be able to determine if you have been successful. If the bud has united with the stock it will look fresh and green, and if it has not united it will have begun to turn black and look shriveled, in which case a new bud may be inserted on another part of the stock.

c. d. c. b. a.

In two or three weeks after the operation it will be necessary to loosen the bands and in two weeks more they can be entirely removed. Should any shoots spring out from the stalk below or near the bud they must be removed at once. Next spring, as soon as the buds begin to break, cut off the stock four inches above the bud, leaving the remaining stump till about midsummer. This will cause a pressure of the sap at the new bud, and it will soon get a vigorous start. The young branch must now be made to grow straight by supporting it with a stick, and should gradually be formed into a tree.

UNCLE MARK.

A NEW AUNT.

UNCLE MARK.—I have been wanting to write you for some time, and ask for permission to join your Horticultural Club, but the thought that it was childrens names that you wanted, kept me from sending mine. I am not a child—still not very elderly, and when I read that Uncle True had joined, I thought you might receive Aunt Earnest, also. I am very fond of flowers and am willing to spend a good deal of time and labor on them, and have found by experience they will not thrive unless loved and tended faithfully. I hope all the members have Pansies, Phlox, Petunias, Verbenas, and Sweet Peas, as they are constantly in bloom. The RURAL seeds, all but Aquilegia and Callicarpa Americana came up and are growing finely. I hope the Eryngium Levenworthii will bloom; it is so interesting to watch new plants grow and blossom. I have five little Pinus edulis trees. We have eighteen hills of potatoes from the "Beauty of Hebron." There is a little pest called the "heart-worm," that is killing plants of all kinds. Wonder if there is a remedy for it. I suppose the Pinus edulis trees will not be hardy enough to live out doors all winter. Hoping that you will place my name on your list, I remain AUNT EARNEST.

[Aunt Earnest is welcome to join the Horticultural Club, as is, indeed, any aunt, uncle or cousin who may desire to do so. I hope she will write us often, tell us of her experience in gardening and make such suggestions for the good of the Club as may occur to her. Pinus edulis is hardy.—UNCLE MARK.]

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE MARK:—I have received two nice presents from you since I wrote to join the Club, and I wish to thank you. Of all my flowers, my bulb is my pet. I waited, as you wrote, till the middle of May to plant it, and set it out on the 15th; it is now 21 inches high. I have kept the earth loose and rich around it, and watered it almost every day. We have other Gladiolus, but I hope mine will be of a different color. I wish the other boys and girls would write about their bulbs. I have planted my radish seed that you sent me, and it is just coming up. I did not plant any other kind of garden seeds. Some of my flower seeds did not come up very well. I have put a cord fence around my flower bed, to keep the chickens out. I am afraid all the other boys and girls will be more worthy members of the RURAL Horticultural Club than BERTHA H.

Johnsons, N. Y.

DEAR UNCLE MARK:—I will keep my word and write again, seeing that you was so kind as to print my other letter. I have some wild pinks growing which I think are prettier than tame ones, but they have no fragrance. I have longed to see you. I wonder if any of the cousins ever saw Uncle Mark. I would like to have your picture. Well, my letter is not long, but I will close. If this is worthy of publication, I will write again. LUDIE STANLEY.

Spaulding Co., Ga.

DEAR UNCLE MARK:—I have been talking about joining your Horticultural Club for some time, but have neglected to write to you about it. If you please, put the names of my sister and myself on your list. They are Fannie S. Gifford and Alice B. Gifford. We have each a large flower bed in which we have transplanted quite a large variety of plants. They are all doing well, and I think that some of them will be in blossom soon.

Chautauqua Co., N. Y. ALICE B. GIFFORD.

The Puzzler.

GEOGRAPHICAL DECAPITATIONS.

1. BEHEAD a river of Africa, and a row.
2. Behead a cape of Alaska, and leave a weapon for a bow.
3. Behead a country of Europe, and leave distress.
4. Behead a river of Scotland, and leave a plant.
5. Behead a river of Asia, and find a marsh.
6. Behead a gulf of Europe, and find far from sea.
7. Behead a river of Wisconsin, and leave an animal.
8. Behead a city of France, and leave frozen water.
9. Behead a river of New York, and leave want.

☞Answer in two weeks. MICK.

NUMERICAL ENIGMA.

THE whole, consisting of eight letters, signifies "Good-by."

The 1, 2, 3, 4, is food.
The 5, 6, 7, 8, is a pit.

☞Answer in two weeks. UNCLE W.

DIAGONAL PUZZLE.

1. A consonant; 2. Two vowels; 3. To make a noise like a pigeon; 4. A river of New York.—Primals and diagonals form parts of yourself.

☞Answer in two weeks. L. ONE.

DIAMOND PUZZLE.

A consonant. A short sleep. A wanderer. Injuries. A heathen. A liar. A consonant.

☞Answer in two weeks. UNCLE WILL.

RECENT LITERATURE.

The Art of Figure Drawing: Containing Practical Instructions for a course of study in this Branch of Art by CHAS. H. WEIGALL, of the Queen's College, London, and member of the Institute of Painters in Water Colors. With Seventeen Illustrations on Wood by the Author and Engraved by W. G. MASON. From the Twenty-first London Edition. Edited by SUSAN N. CARTER, Principal of the Women's Art School, Cooper Union. NEW YORK: G. P. Putnam's Sons.

AN idea of the scope and object of this work can best be conveyed by giving a portion of the Preface: "The author indulges the hope that the following brief work on Figure Drawing may be perused with advantage by the Artist as well as the Amateur; and that although it is not to be expected that all which may be required to make a figure draughtsman will be found in its pages, sufficient information may be given to facilitate self-instruction; and that, at least, there is nothing that will place any impediment in the way of the pupil who may receive the benefit of a master's attention. In the rules and illustrations, all minuteness and complexity have been avoided as much as possible."

National Banking: A Discussion of the Merits of the Present System by M. L. SCUDDER, JR. NEW YORK: G. P. Putnam's Sons.

It is the fashion just now in some quarters to decry National banks, and most of those who so firmly maintain that these banks ought to be abolished, have no intelligent idea of the workings of the system. The monograph under notice contains a clear, succinct statement of the history of the National Banking Act; the history of previous banking in this country; a comparison between State and National banks, beside giving much useful information on the subjects of bank notes and legal tender paper money. The low price (25 cents) puts the pamphlet within the reach of all who are at all interested in the question of finance, which threatens to play so important a part in politics in the near future.

Baker; One Sunday Morning, E. C. Gardner; Only a Word, Mary Keely Boutelle; Stand-Bys, John C. Kimball; A Sorrowful Guest, Sarah O. Jewett; Hebrew Women, Mary M. Cohen; Max, Helen Campbell; Oriental Law and Courts of Justice, Fannie Roper Feudge; Some of Miss Help's Proteges, Julia McNair Wright; Sunday-School Songs, L. M. Rose; The Monkey's Story, Lizzie W. Champney; Three English Allegories, Arthur Gilman; The Still Hour; Editor's Table—The Problem of Revision, Dickinson's English, The Good Old Times, Lessons from the Life of Garrison; Literature.

THE punishment threatened against Tyre was not inflicted all at once; many generations passed before the last drop of the cup of retribution was poured out upon the doomed city. This is the ordinary method of the divine administration. Punishment does not come down in one stroke upon the transgressor; it is often slow in coming; it stretches over long years of disobedience. And because sentence against an evil work is not executed speedily, the hearts of the sons of men are often set in them to do evil. But they ought to remember that though "the mills of the gods grind slowly, yet they grind exceeding small." The methods of retribution may be less dramatic and forensic than they are sometimes represented, but the fact of retribution is a fearful fact; it cannot be argued down, and it is madness to ignore it.

What the sinner will *suffer* in the world to come, we know only in hints and shadows. But we know very well what he will *be* in the world to come. The law of the development of character is a law that we understand. It is easy to show its workings and to prophesy its issues. And if you can clearly show a transgressor *the thing that he is certain to become* if he keeps on in evil ways, the sight will deter him from transgression more powerfully than any vision of suffering that you can set before him. Of what is to be inflicted upon him you must speak guardedly; you do not know much about that; but of what will take place *in him* you can speak with perfect assurance, and his own conscience will bear witness to the truth of your words.—*Sunday Afternoon.*

PERSONAL ITEMS.

Governor Drew, of Florida, is worth half a million dollars.

The Emperor William is six feet in hight and Prince Albert, his nephew, measures six feet six inches.

The Duke of Sutherland, who is a thorough practical engineer, drove the locomotive attached to the train which conveyed the Prince and Princess of Wales around the royal agricultural show.

M. Meissonier, the best living French painter, several years ago began a portrait of the late Prince Imperial, which the events of 1870 prevented him from finishing. He now intends to complete it and send it to the Empress.

Ansley Gray is a member of the Dakota Legislature and writes "Hon." before his name. A few days ago he was put behind the bars in Bismarck for handling bogus checks, which reduces the crop of statesmen by one.

Simmonds shot two bullets into Paddock's body, at Greenfield, O. Paddock seemed resentful, for before dying he knocked Simmonds down and pounded him with stones, injuring him so badly that he may not recover.

Monsignor Manning, nephew of Cardinal Manning and one of the Papal chamberlains, is dead. He was about 45 years old, a convert to Catholicity, like his uncle, and educated for the priesthood at Ushaw College, Durham, the chief Roman Catholic college in Great Britain.

Prince Charles Napoleon Bonaparte, the second son of the eldest brother of the great Napoleon, is said to be preferred at Chiselhurst as head of the house to Prince Jerome Napoleon. Prince Charles is 40 years old and has the true Bonaparte face. He holds the position of president of the council general at Corsica, where he is very popular.

Grace Greenwood says of Charles Reade, whom she has recently been visiting: "I found him a grave, fine-looking man, of middle hight, with iron-gray hair and beard, and large, dark eyes of remarkable beauty. In manner he is rather cold, but courteous, and he avowed a special kindly feeling toward our country saying 'I am always at home to Americans.'

Mrs. Fitzhugh, the relict of Henry Fitzhugh, and a grand-niece of George Washington, has taken up her residence in Charleston, West Virginia. She will be ninety years of age in November, but retains her mental faculties and is in sound bodily health. She remembers Washington, for he often visited the house of her father, Judge Nicholas Fitzhugh, in Alexandria, near which Mount Vernon lies.

Two Texan legislators had a fisticuff in the House of Representatives at Austin, on Friday of last week. Ashbel Smith, Democrat, of Harris and Bob Taylor, Republican, of Fannin, both octogenarians, were quarreling, when the former approached Taylor and kicked him. There was a wild uproar, when Smith hallooed to Speaker Cochrane: "I was only illustrating the Governor's position of 'Pay as you go.'"

Master Isaac Bell, Jr., the young nephew of James Gordon Bennett, of the New York Herald, is about a fortnight old. The day after the young gentleman's advent his uncle called to see him, and laid on his cradle 100 United States bonds of $1,000 each as a christening gift, or rather a gift of "joyous arrival," according to the old mediæval custom at the accession of a king. Oh, for more uncles of that sort! We'd almost become children again to own such a one.

There comes a gleam of hope. Alexander McLear, a deacon of the Brooklyn Tabernacle, when asked to buy some of the Tabernacle bonds, the other day, replied that he did not think the bonds were worth the price suggested, as it seemed doubtful, very doubtful—yes, he said very—whether the Rev. Dr. De Witt Talmage would ever return from Europe to his charge. The clerical gymnast now draws as large audiences and nearly as much money in England as Sarah Bernhardt, the French actress, but the actress attracts chiefly men and the preacher, women.

Of General Grant and wife in their poverty-stricken days of 1861, a picturesque little story is told. He had gone from Galena to Springfield to get a Captaincy in a regiment then being organized, and in his absence Mrs. Grant went to one of the Galena shops and asked for a barrel of flour on credit, as she had no money. Her request was refused, when a bystander, who was also a merchant, approached and told her she could have anything she wished from his store. This kindness in time of need was never forgotten by Grant, and after he became President he bestowed substantial favors upon this good-hearted and patriotic grocer.

Judge Shock presides over the summit County, Colorado Court now in session at Breckenridge. Last Monday one Charles Jones arose from his seat in the court room and proceeded to reprimand the Judge for some ruling. The Judge ordered the arrest of Jones, but the latter escaped from the room. Later in the day Jones re-entered the court room, walked towards the bench and leveled a Sharp's carbine at the Judge's head. The Judge grabbed the stock of the gun and pushed it aside just in time to save his life, for the charge went crashing—not to the jury, as charges in court generally do—but over Judge Shock's head and made a large rent in the wall. Jones was pinioned by the jury and locked up.

Hop Bitters have more patience than Job, curing thousands of patients daily. See Proverbs.

Trees, Seeds, Plants, &c.

10 ACRES STRAWBERRIES.
50 VARIETIES, embracing the largest, best and most productive, grown in pots or layers.

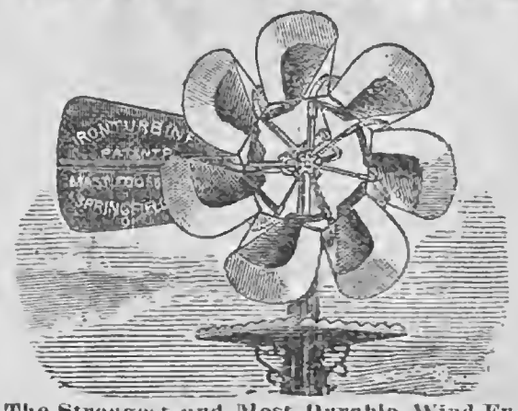
Implements and Machinery.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO., BUCHANAN, MICH.

NEW IRON TURBINE WIND ENGINE



The Strongest and Most Durable Wind Engine in the World. Sold by Dealers in nearly every County. Inquire for it. Every Wind Engine Fully Warranted.

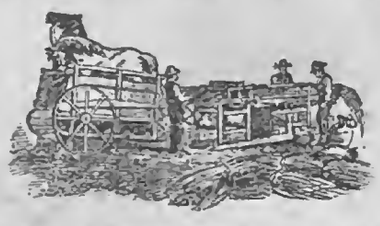
UPTON M'F'G CO., BATTLE CREEK, MICH.

Horse-Powers,



For One, Two and Three Horses.
MACHINES FOR
Threshing and Cleaning Grain and Sawing Wood.
Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.
The machines with the improvements are the result of more than thirty years' careful study and experiment.
The proprietors are the inventors, ever have been and still are the sole manufacturers.
We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.
We believe that we manufacture the best machine of the kind in the country.
Our machines have never failed to receive the highest award at all competitive exhibitions.
Circulars and Price Lists free. Address as above.

MYERS' Improved Wind-Mill.

Perfectly self-regulating, and the only Wind-Mill that stands on the derrick in perfect balance, in and out of gear. It is warranted to be well made and to stand the most violent storms. Every farmer, stock-raiser, and dairyman should have one for pumping water, grinding feed, etc.
Send for Circular and Price-List,
Silver & Deming Mfg. Co., Salem, Ohio.

1840--PAYNE'S PATENT.--1879

AGRICULTURAL ENGINE.
This Engine, which has been thoroughly tested, is guaranteed to be as effective and develop as much power as any built.
Our 10-Horse Threshing Engine will furnish ample power to drive the largest Thresher and Separator used in this country, without over-pressure or excessive firing.
8-HORSE POWER, Weight 4500 lbs., $650. 10-HORSE POWER, Weight 4700 lbs., $750. $20 Extra for Brake.
We hereby CHALLENGE
Any Manufacturer of Agricultural Engines not fitted with Automatic Cut-off, to a competitive test at a forfeit of from $500 to $1,000, as may be desired.
Send for Circulars, and state where you saw this, to

New Publications.

The Voice of Worship,
For Choirs, Conventions and Singing Schools.
BY L. O. EMERSON.
This splendid book is now nearly through the press, and will be in great demand. Full collection of the best Hymn Tunes and Anthems for Choirs, numerous Glees for Social and Class singing, and a good Singing School course. Its attractive contents, with the low price ($1.00 or $9.00 per dozen), should make it the most popular of Church Music Books.

THE TEMPLE. *For Singing Schools. Conventions and Choirs.* By W. O. PERKINS, will be ready in a few days. First class book for Singing Schools, with large collection of Glees, and plenty of Hymn Tunes and Anthems. Price $1.00 or $9.00 per dozen. Although Singing Classes are especially provided for, both the Secular and Sacred Music render it one of the best Convention and Choir Books.

FATINITZA. The new and very favorite opera, is now ready, with words in three languages, all the Music and Libretto complete. Price $2.00 paper. $2.25 boards.

PINAFORE. Price reduced to 50 cts. The same elegant edition heretofore sold for a dollar. Complete Words, Libretto and Music. All ready for the stage.
Any book mailed for retail price.

Improved Farms for Sale
IN CENTRAL ILLINOIS.
Parties desiring to secure *bargains* in improved farms should write to Barnham, Trevett & Mattis, Champaign, Ills., *before investing elsewhere.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money in the paper and in Premiums to All.

Humorous.

A WELL-MERITED repartee was dealt by a smart Midshipman to the daughter of a K. C. B. at a ball given by the latter to the naval officers on the North Pacific station. The middy was bold enough to ask the young lady to accept him for her partner. "Oh dear, no," said the supercilious beauty. "Ma never allows me to dance with Midshipmen!" Somebody let her know the middy was a lord, and she repented, and by-and-by reminded him he was engaged to her for the next dance. The youngster, however, was not so easily to be mollified, and, remembering the lady had native blood in her veins, smilingly replied "Oh dear no! Ma never allows me to dance with squaws."—*Chambers' Journal.*

A GENTLEMAN, being threatened with an infectious fever, said to his little son who in an affectionate mood wished to embrace him, "You mustn't hug me; you'll catch the fever. Willie standing back, looked in amazement upon his papa, who, by-the-way, is a pattern of propriety, and quickly asked, "Why, papa, who did you hug?"

A GRAMMATICAL ERROR.—Colorado has the most delightful climate in the world, and bed-bugs. A mother in Israel residing there requires her granddaughter, a young high school miss, to read her daily some portion of the Good Book. While so engaged recently the young lady snddenly stopped, and exclaimed: "Why, grandma, I declare, here is a grammatical error." The old lady replied: "No matter, darling, kill it and go on."

"ONE kind of a ship I always steer clear of," said an old bachelor sea captain, "and that's courtship; 'cause on that ship there's always two mates and no cap'n."

MONUMENT TO THE MAN THAT INVENTED THE ACCORDEON.

Distressing Symptoms

In the stomach and bowels may announce the existence either of dyspepsia in the first or an obstruction in the second, or the approach of some choleraic complaint or simple diarrhœa. Colic, bitter or sour eructations, a pressing down of the bowels, a feeling of oppression or fluttering at the pit of the stomach, are among these unpleasant symptoms. They and their cause are speedily remedied by Hostetter's Stomach Bitters, a wineglassful often causing an immediate cessation of pain. When the difficulty continues, it is only necessary to pursue the use of this standard carminative and anti-dyspeptic medicine to obtain entire and permanent relief. Nothing in the composition or flavor of the Bitters is in the slightest degree objectionable. Medical men pronounce it eminently pure.

From the Factory to the Wearer.

Shirts of Superior Muslin, Extra Fine Linen Shield Bosom, Open Back, French Yoke, and completely finished for
$7.50 A DOZEN!!
Having completed arrangements with one of the largest Cotton Factories in the United States for an unlimited supply of Shirting Muslin, at the extremely low prices reached during the prevailing business stagnation, and having largely increased our facilities for the manufacture of **men's** and **boys' Shirts,** in all styles, we have decided to make an important departure from the route usually adopted by similar establishments, and to place ourselves directly in communication with the **consumer,** thus avoiding the enormous profits required by **middlemen** and the **retail trade,** and enabling us to make the following unprecedented offer:

12 Superior Muslin, Fine Linen Finished French Yoke Shirts, as above, ready for wear,	$7.50
6 " " " " " " "	4.00
3 " " " " " " "	2.25

An elegant set rolled gold plated Sleeve and Collar Buttons presented to each purchaser of 3, 6 or 12 Shirts.
Sample Shirt finished complete, with a set Buttons as above, sent **prepaid** by mail on receipt of **85 cents.** We **warrant** these Shirts to be **first-class** in every respect, to be **substantially** and **neatly** finished, and equal in **appearance, durability** and **style** to any Shirt in the market costing two or three times as much. Send size of collar worn, circumference of chest and length of arm. Remember in ordering from us you **save all outside profits.**
Boys' Shirts same price as above. Postage Stamps or Currency taken. Catalogue of goods sent with all shipments. NEW YORK FURNISHING CO., 421 Broadway, New York, U. S. A.

CHEAPER THAN HOME-MADE,
AND NOTHING MORE SIMPLE.
BONES OF ANIMALS DISSOLVED IN ACID.
BAUGH'S AMMONIATED DISSOLVED ANIMAL BONES.
This article has been used for years by many of our leading farmers with excellent results, and is now one of the most popular brands we make. Price low.
☞ In view of the risk and cost of transporting acid in carboys, this article of Dissolved Bones presents great advantages to those farmers who have been making their own phosphates on the farm.
Circulars furnished on application. All *Fertilizing Supplies* at the lowest market prices.

Floricultural.

IRISES.

WILLIAM FALCONER.

In many old, country gardens the Iris, or Flower-de-Luce, is one of the mainstays, and very showy it is, too, in spring and early summer; but in city and fashionable gardens the dear old Irises are almost forgotten. The brilliance of Pelargoniums, Coleuses, and other paraphernalia of summer, together with the ridiculous vulgarity of houseleek hills, have so corrupted the general taste as to almost erase a liking for our old-fashioned garden hardy flowers. Irises are widely distributed throughout the Northern Hemisphere, and particularly abound in Mediterranean Europe, Northern Africa, the Caucasus, and the mountains of Turkey and Persia; Siberia, Northern China and Japan also add conspicuously to the list, and North America contributes not a few.

From the fact that our Blue Flag and Boston Iris grow wild in damp meadow and marshy lands, we might naturally suppose that wet soil would be indispensable to their well-being; but it is not so, for they grow and flourish in the ordinary garden border; indeed, the European Yellow Flag is quite at home with us, growing in the water alongside of Pond Lilies and pickerel weeds, and also in the flower-beds associated with Pentstemons and Columbines. They grow well in clayey or gravelly land, in open sunny spots, shady corners, or naturalized in half-wild places; but they revel in rich, sandy loam. In planting, keep the root-stocks on the surface; because, if you bury them, in damp, muggy summer weather they are sure to rot off alarmingly.

The Crested Iris of the Alleghanies, Spring Iris of the South, and Dwarf Garden Iris of Europe, are all pretty little plants with bluish flowers, and well fitted as edgings for shrubbery or other borders. Iris Hartwegii is a "new" kind from California; it has cream-colored flowers, is dwarf, hardy, and blossoms copiously in June. The varieties of the German Iris are the commonest in gardens, and many of them are quite handsome. The Pale-blue Iris (pallida) is a showy and noble kind, and the Elder-scented, Variegated Siberian and its varieties, Golden (Monnieri), Grass-leaved, Copper-colored (fulva), Wall (tectorum); Mourning (Susiana), and Yellowish Irises (ochroleuca and flavescens) are all good garden sorts. But the finest yellow-flowered Iris I know of, is I. aurea, a native of the Himalaya Mountains, and now (July 10) in bloom with us; its flowers are a deep golden yellow.

Iris Iberica is a small but uncommonly handsome-flowered species, a native of the Caucasus and the mountains of Armenia and the north of Persia, and a recent, applicable and valued introduction to our gardens. The standards are a very pale purple—almost white—faintly streaked or veined and spotted near the base with a darker hue; and the falls are dull red with tawny streaks, and have an oval, black, velvety blotch in the center of each.

Iris Iberica var. insignis, is one of the varieties of this species, and the subject of the annexed illustration, which originally appeared in the Gardeners' Chronicle. It was found among a batch of roots imported some three years ago by a Plant and Bulb Company, Colchester, England. In this Iris the standards are, in color, lilac-white, veined and thickly spotted throughout with a deeper tint of the same hue. The falls are white, veined with black lines, densely spotted and blotched with reddish-brown.

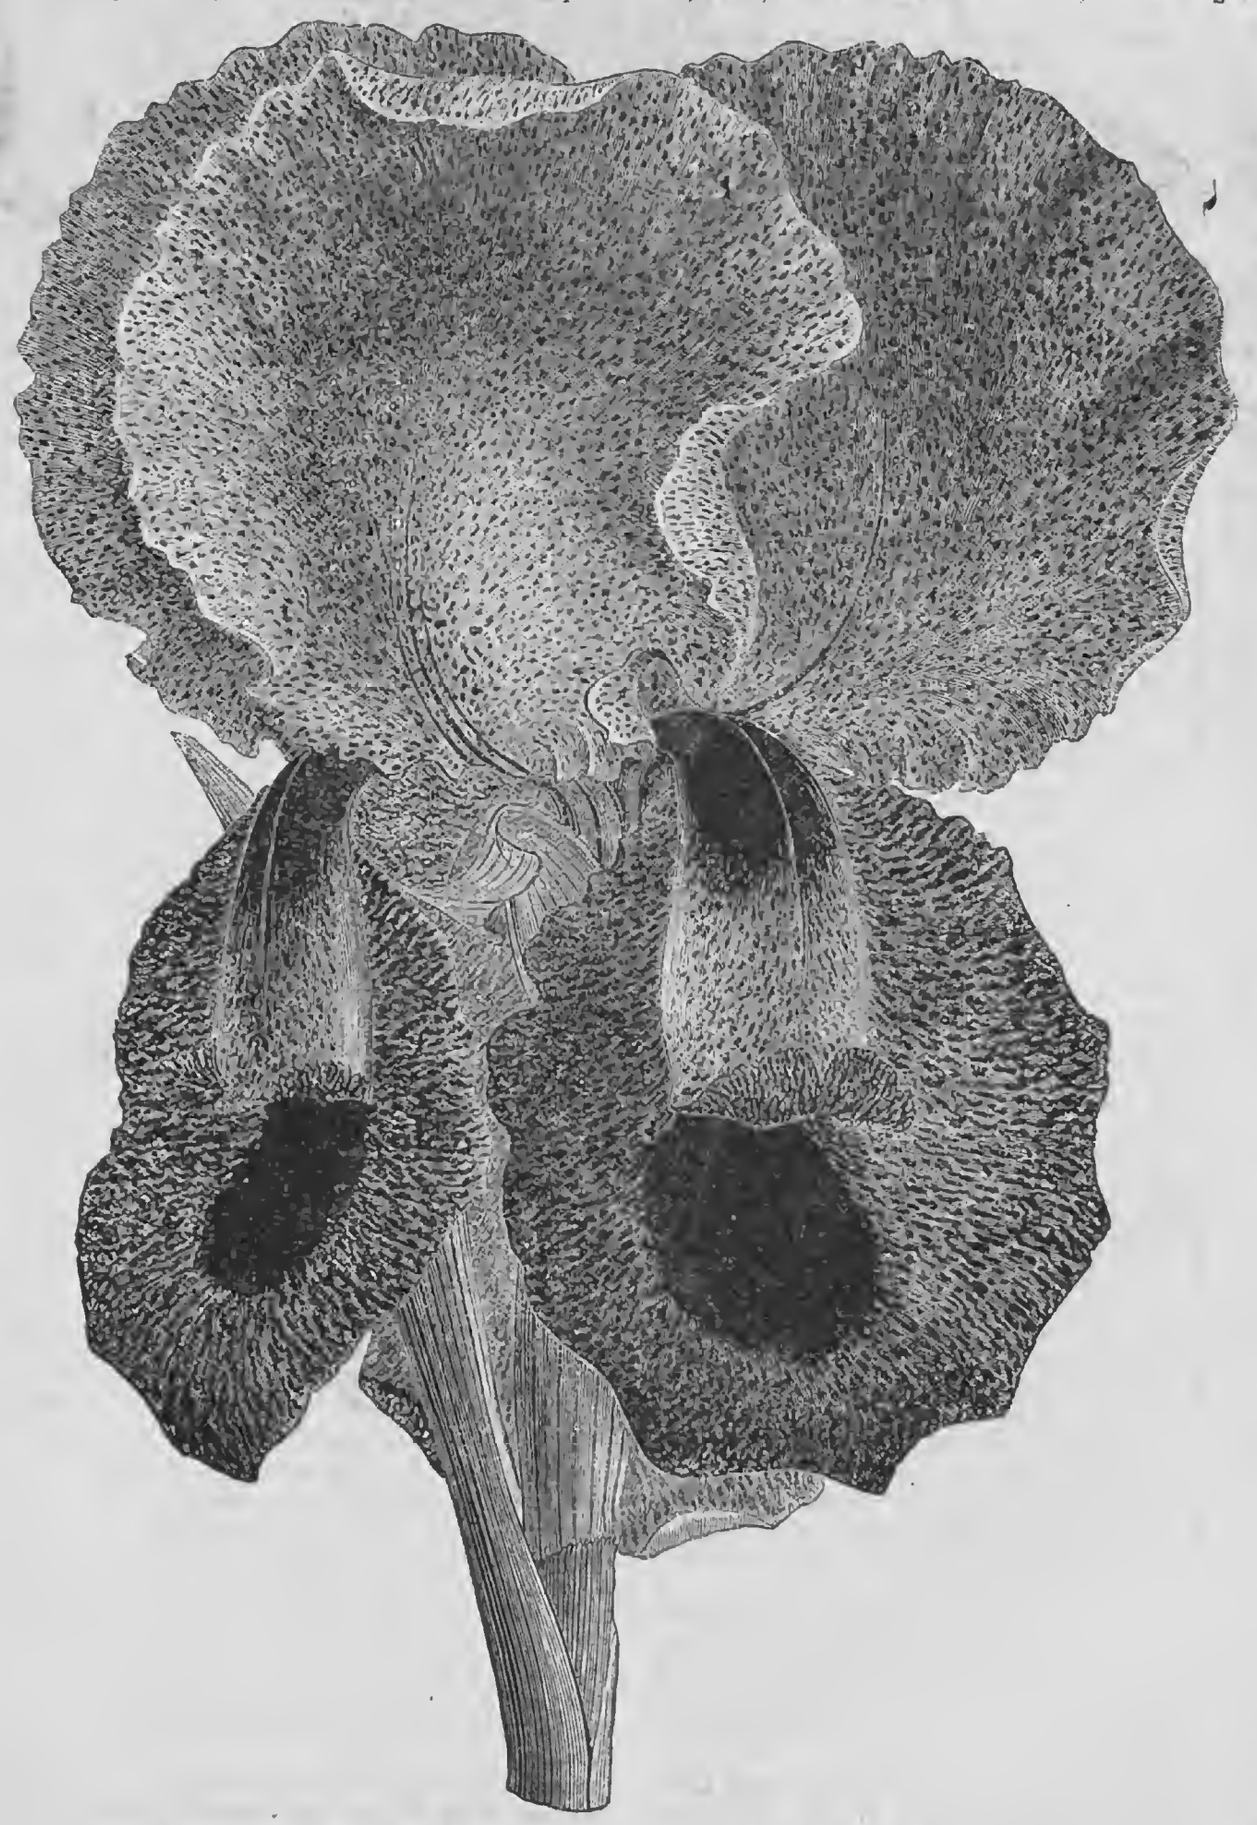
Iris lævigata (Kæmpferi), indigenous to Eastern Siberia, Northern China and Japan, is hardy and thrifty and bears its very deep purple blossoms in June. But the varieties of lævigata that have been recently introduced from Japan, eclipse in size or showiness anything in the way of Irises we ever knew. The flowers are flat, from five to seven inches across, and of every shade of color from the purest white to the deepest purple, and they are also most gaudily variegated—penciled and blotched. These varieties are among the most showy of all known hardy herbaceous plants, and they come into bloom from two to four weeks later than the typical species, than which, also, most of them are far more robust. In the middle of June, lævigata itself was at its best bloom with us, but not one of its varieties that we have got, opened till the first of July, and even now (July 10th), though most of them are in their heydey, some have not yet begun to open: and of all the Irises we possess, except the Yellow Flag, these forms of lævigata are the most thrifty and robust, and certainly copiously floriferous. The bulbous-rooted section, the English and Spanish Irises, for example, are now, by many authorities, separated from the genus Iris, and put by themselves into a new genus, called

Xiphion,

but in this garden we have not changed their generic name, but call them Irises, as we used to. They are a set of little beauties, and all well fitted for window-gardening. In the out-door garden, I. reticulata, for instance, strengthens and multiplies with each succeeding year, whereas others, like I. juncea, Sisyrinchium, and Persica, unless given a suitable position, are apt to become weaker each year or disappear altogether. To treat them successfully, grow them in open, warm nooks and in deep, well-drained, sandy soil. I. Kolpakowskiana (a new species from Turkistan, and the earliest with us), Persica, Caucasica, and reticulata, are among our earliest spring flowers; some, like reticulata and Persica, are deliciously fragrant, whilst others, like the Caucasian and Spanish, are almost scentless. It is not a good plan to deeply mulch-protect them through the winter, as many of them start very early into growth, and would grow under or through the mulching, and become sadly weakened in consequence. After their leaves die down, say about the first of September, I find it a good plan to lift and store the bulbs in pots of dry sand, yes, or in paper bags, for two or three weeks, and in this way prevent the premature fall growth that frequently occurs. For window or pot culture, grow them as you would Hyacinths, Squills, or Tulips; bury the bulbs an inch or two in the soil, and, observing the difference in their flowering periods, guide your practice accordingly. But do not, under any circumstances, submit them to the unnatural barbarity of the water-bottle. When ripe, the seed-vessels of the Gladwyn (I. fœtidissima) burst open and display their bright coral-red "berries," in manner not unlike the coral plant (Erythrina herbacea) of the Gulf coast, and are then gathered by the English to mix with dried grasses, Everlastings and Ferns for winter bouquets. A variegated form of this species is a favorite house plant in Europe, being considerably used for window, vase and balcony gardening.

The root of Iris Florentina (a native of Southern Europe) yields the Orris Root of commerce, which, though possessing medicinal properties, is seldom used except for flavoring purposes. The fluid extract of it is an esteemed perfume for handkerchiefs, eologues, ointments, etc. In Italy alone 400 acres are devoted to the growing of Orris Root. The root of Iris versicolor (our common Blue Flag) has cathartic, alterative and diuretic properties. It is used extensively in eclectic practice as a substitute for mercury. Gerard calls the roots of I. Sisyrinchium "Spanish nuts," and says that they are "eaten at the tables of rich and delicious persons in salads or otherwise;" and Phillips, in his Flora Historica, says: "In Africa the roots of the edulis Iris are esteemed as food after being boiled, and they are eagerly sought in that quarter of the world by the monkeys." In "Adam in Eden," published in 1657, I observe great medicinal properties are ascribed to the Iris; and even Loudon repeats several of them.

[As we have already announced, we have secured a large quantity of seed of the hardy and really beautiful Iris lævigata, described by Mr. Falconer, which will be given to our subscribers in our next seed distribution.—Eds.]



IRIS IBERICA, var. INSIGNIS.

FLORICULTURAL HINTS.

To have Pelargoniums bloom in midwinter, or before, it is necessary to take cuttings now. Any sort of a box, three inches or more deep, filled with sand, will answer for a propagating box. This should be kept moist and exposed to the morning sun. Many cultivate the same old plants for years. But thriftier specimens and more flowers are secured by raising new plants from cuttings every year. Young plants, moreover, take up less room in the house or conservatory; they are more symmetrical, and the leaves are larger and brighter.

All hardy shrubs may now be layered, and strong young plants will be ready for transplanting in the spring.

The Great-panicled Hydrangea (H. paniculata grand.) is now showing its flower-buds. Liquid manure plentifully applied at this time will insure panicles twice the size which would otherwise develop. This plant cannot endure drought. The leaves wilt and the shrub during August puts on a sorrowful look far from pleasing.

Horticultural.

SMALL TALKS AND SMALL FRUITS.

Strawberries.

Now is the time that "pussley" will get ahead of you—especially in the strawberry beds—and other weeds as well as pussley, unless you are on the alert. I find it cheapest to kill all weeds before they are large enough to be seen, in fact before they get above ground, by going over my beds with hoe, rake or cultivator, every week or ten days. This is also quite beneficial to the plants, as it stimulates growth and prevents drought from penetrating the soil. Plants are now making runners rapidly, and if the largest and finest fruit is desired, they should be pinched off as they appear, causing the plants to form large "stools" with mature crowns for fruiting. Should *plants* be desired, it is well to press the small plants about to form roots into the ground slightly, and place clods on the stems to hold them still. This will cause them to root quickly and make large, strong plants, and will pay, particularly if you have something new or rare that you desire to multiply rapidly.

Tie Up the Grape Vines.

Valuable Grape Vines, planted with great care, are often left to take care of themselves at this season of the year—when they need care most. For the first two years a good, stout stake, say six feet long, is all that is necessary for a support. This should be firmly set in the ground *and the vines kept tied to it.* Should other shoots start from the old wood, rub them off and keep lateral shoots pinched back to one or two leaves. Remove all injurious insects by hand, and dust with flour of sulphur should mildew appear.

What a prince among Raspberries is

The Cuthbert.

The other day a fruit-grower remarked to me: "Do you know of any *good,* reliable raspberry for market?" In answer to which I named the Cuthbert. "Well," he questioned, "is it large?" "Yes." "Is it handsome?" "Yes." "O! is it *firm?*" "Yes, very!" "Is it of good flavor?—although that seems to make but little difference now-a-days." "Yes, nearly as good as the Antwerp." "It isn't a good grower and productive, then, is it?" "Yes!" "Well, there! I almost forgot to ask the most *important* question, and I suppose that's the sticking point—Is it hardy?" "YES!" "It is! What *is* the matter with it, then?" To which I was obliged to reply that *that* was just the thing I had been looking for, and although I had fruited it two years, the one I had failed to find. Don't be afraid to

Cut Down the Suckers

of the Raspberries and Blackberries, which are now springing up in great numbers. Leave a few only of the strongest for fruiting, and treat all the rest as weeds. Unless this is attended to, the crop will be small and the berries small and of poor quality. The suckers of some varieties, such as Brandywine, Turner, etc., are their worst weeds, and, unless kept in subjection, render them almost worthless.

July 11, 1879. "MONMOUTH."

THE MARVIN STRAWBERRY.

THE plant I sent to the RURAL EXPERIMENTAL GROUNDS last fall, and which was spoken of in the RURAL of June 28th as an unnamed seedling, was named the Marvin Strawberry, after myself, by the Michigan Pomological Society on June 18th. It was the largest and finest shown at that meeting. People may talk about the Sharpless or any other strawberry, but this berry will outshine them all. I sent some of them to Rochester, New York, in good order. H. MARVIN.

Pomological.

TOO MANY KINDS OF APPLES.

DR. T. H. HOSKINS.

IT is true, as is often said, that those who plant orchards to have apples to sell, are apt to plant too many kinds: In great orchard regions, where everybody has apples, and there is no local sale for the fruit, it would often be better to plant a commercial orchard all of one kind. There are hardly any standard commercial sorts that are annual bearers, except under high culture, and it would be best in such orchards not only not to expect an annual crop, but to pick off all the fruit that sets in the off years, so that insects that attack it may not have a chance to multiply. In that way, the fruit in the bearing years would be much fairer, and a larger proportion of it be marketable as first-class. There is, however, a large class of fruit-growers to whom this rule is not applicable. There are extensive regions in the United States and in Canada, where fruit-growing is not considered profitable, and which depend upon other localities for their supplies. In such regions, there are exceptional spots where fruit does very well, especially in skillful hands, and here the rule of planting few kinds finds its exceptions. The rule, also, of only a few early trees, will often likewise be found not to apply to such orchards. Summer apples will not bear long transportation, and where there is not much local competition, such fruit will often be found to be the most profitable, particularly where well grown and carefully marketed. There are even cases where it pays to make a speciality of summer and early fall apples of choice sorts, grown upon rich land and carefully attended to. In the isolated localities spoken of, it is important to have a supply of fruit every year for market, and therefore such are the places in which to plant not only more kinds, but particularly the annual bearers, giving them the culture that will insure good crops, and by particular care in destroying insects keeping the fruit large and fair.

For a home supply, we, of course, want apples of every season, and we want, too, the high quality not generally found in the most productive commercial sorts. The amateur will find pleasure also in a multiplicity of kinds, and in trying promising new varieties, or varieties not generally grown. Some of our best and most beautiful apples, though productive, are not sorts that bear rough handling, and are therefore unfit for the commercial orchard; but they merit the attention of all growers who regard excellence of quality. Along our northern borders, apple-growing is limited to hardy or so-called "iron-clad" varieties, and here, too, an extensive planting of new kinds is justifiable, indeed necessary, until trial has shown what sorts may be depended upon to furnish good crops of marketable fruit with certainty under the inclemency of such climates. Much can be done by patient experiment to extend the area of fruit culture and give to each locality its special sorts that may, in many cases, continue to be very local as regards successful culture, yet none the less valuable on that account, to the growers. These points all need to be taken into consideration by pomologists and fruit growers, in some cases much more so than they have been.

AN EXPERIMENT WORTH IMITATING.—I have noticed for a number of years past, in this locality, that the bark on many young apple trees was split open in the spring, whether caused by the freezing of the sap, or from some other cause I will not attempt to say; but, whatever the cause, when the warm weather came on, these trees would throw off their bark, if not clear around, on one side of the tree, and the tree was almost sure to die before the summer was over, or if not entirely killed, it became so badly diseased as to ruin its future growth. In a case which I treated the bark was split open the whole length of the body of the tree on one side, and a portion of the way on the other side, so I was almost certain of its death; but, thinking I would make one effort to save it, I cut through the bark, the entire length of the body and on the main limbs, and whether from this treatment or from some other causes, the growth of the tree was never checked, and to-day it is as thrifty a tree as there is on the farm. Now I believe this experiment worth a trial at least, as no harm can result from it in any case.

E. J. B.

Rural Architecture.

AXIOMS IN BARN BUILDING.

C. E. VERNIER.

IN the RURAL of June 28, appeared an article from Mr. W. I. Chamberlain, in defence of a series of previous articles of his, entitled "Axioms in Barn Building." In this last article, he admits the justness of the criticism I ventured to make on his "axioms," in the issue of May 17, but pleads in his own defence that although he knew the axioms were false, except under certain conditions, he had made some mental reservations regarding them which he expected everybody to take for granted, though he did not state them. Furthermore, since one Michigan man foolishly supposed he meant what he said, he infers that all the farmers of Michigan are like his critic in that they do not possess common sense.

He will probably claim the same privilege in regard to this last article, and we shall doubtless learn that his meaning was quite different from his statements. He seems to think my statement that the upright posts of a barn, if doubled in length, need to contain nearly four times (in the example I presented it was over three, but in some cases is even over four times) as much material, only true when they stand without lateral bracing, and not true in any barn frame where "girts" are used.

Although my former statement was made under conditions which do not exist when much trussing is done, still this much is true, as the *girts are put into an ordinary barn they weaken rather than strengthen the upright posts.* Without entering into any general discussion of this, one or two illustrations will show that the post is prevented from bending laterally only in the plane of the frame, and, for a direction at right angles to this, it is as weak as

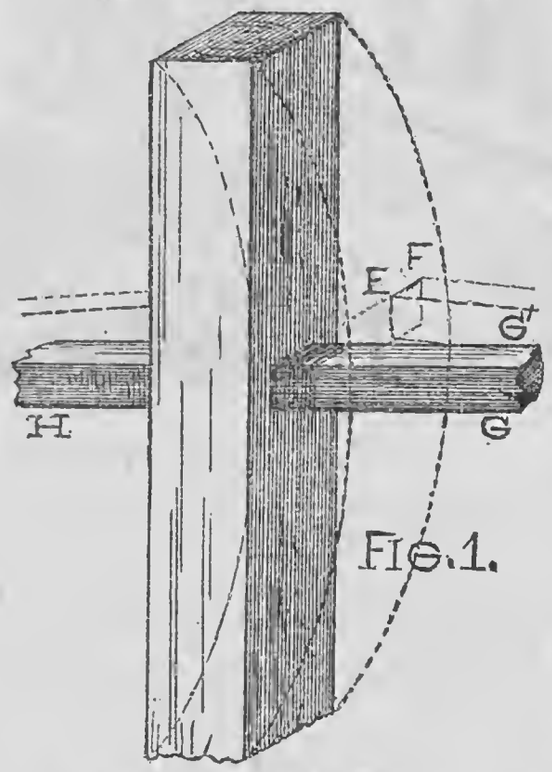


FIG. 1.

though no girts were used. If the girts are pinned into the corner post and do not push against it, they may give it some support laterally in every direction, but to prevent the post from bending outward, they will interpose only the shearing strength of the pins. Unless the side posts are braced with girts from every direction, they are as weak, so far as bending in or out is concerned, as though no girts existed. Again, girts cannot be fastened into a post without weakening it somewhat; if the joints were perfect there would be no weakening, but a perfect joint is impossible, and the joints usually seen are so poorly made, that the upright post is weakened by the whole amount of timber taken out in making the mortise.

Let Fig. 1. represent a portion of an upright post of a barn, and G. H. girts which are let into mortises with the posts. They are usually set so that their faces are flush with that of the post. If a weight is placed on top of the post, it will tend to bend it laterally, the girts will prevent it from being bent towards G. or H. but will exert no force whatever to prevent it from going into the position E. F. for a component if any force acting at right-angles to the force, is nothing. "As the weakest spot must stand the strain" the post will bend as easily as it formerly did, in two out of four directions, and is no stronger than before for that very reason.

In Fig. 2. is shown a corner post. In this post there is nothing to resist the push of the girt E. or the girt F. except the post itself, consequently the girts are a source of weakness rather than of strength to the post. This is also seen from the fact that any tendency of any of the other posts to bend in the plane of the frame, is resisted by the girts; this resistance is transmitted through the girts to the corner post, which must be large enough to

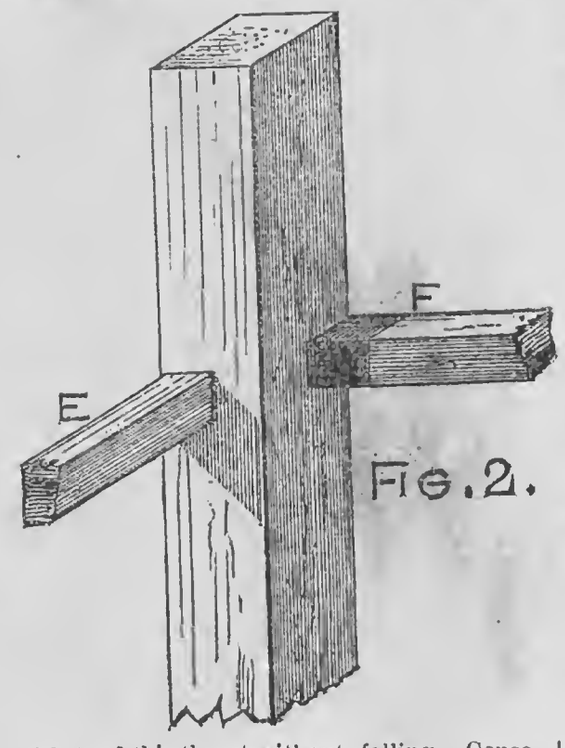

FIG. 2.

withstand this thrust without falling. Consequently it is evident that each post must be constructed of sufficient size to stand all the weight put upon it; otherwise the frame will not possess stability. All that Mr. Chamberlain said in regard to the effect of putting girts in a barn, is hardly true for any barn frame that ever came under my observation; though I do not wish to be understood to say, that it is *not* possible so to brace the upright timbers of a barn, as to make them much stronger.

Mr. Chamberlain makes another plea for his "axioms" from the fact that farmers in Ohio build "Dutch barns," and use timbers many times larger than are necessary, and consequently the barns could be made twice as high or twice as wide without much extra expense. I may say here that though that argument is doubtless a good one in Ohio, it is of no weight whatever in Michigan. So far as my experience is concerned, the farmers of Michigan long ago ceased to build barns with timbers so large that they would not season through, and for some years have built (as a rule) barn frames with timbers somewhat in proportion to the strains that would be thrown on them. The present tendency is to build frames too light rather than too heavy. Again, Mr. Chamberlain speaks of the *tensile* strain *on a post.* I think the usage of this word is probably as original as his use of the word axiom. Greek may sanction it, but the usage of engineers does not.

Lansing, July 3rd 1879.

Dairy Husbandry.

HISTORY OF A POOR FARM.—No. 13.

A Young Lady's Opinion of Some Matters in Regard to Milking, Etc.

IT was a beautiful evening in June; the scent of the newly-mown hay from hundreds of fields around pervaded the air, and here and there one could still hear the rattle of the mowing machines of farmers who chose to work in the cool evening rather than under the burning midday sun. We had promised to inspect Miss Martin's dairy, and that young lady welcomed us to seats on the pleasant porch, shaded with sweet-scented Honeysuckles and climbing Roses and furnished with seats and tables upon which were displayed bowls of strawberries and sweet cream. What a restful occasion it is when, after a day's work in the field, the farmer and his family can gather in the evening and spend an hour or two in chatting, reading, or amusement, surrounded with all those circumstances which make country life desirable! Here, on the verdant lawn spread before us, the little Martins romped and enjoyed themselves—their oldest sister, who filled the place of a lost mother to them, keeping a watchful eye upon them while she gracefully entertained her guests. After a short rest we proposed to visit the dairy.

"First you must see my cows and calves," said Miss Martin. The cows were turned out for the night in a yard well littered with straw and having an open shed at one side, in which they might seek shelter during heavy rains. The shed was furnished with a feed-rack and ties, by which the cows could be fastened to be milked, when desirable.

"I would rather do the milking in the shed in the summer," remarked Miss Martin; "Tom cleans it out and litters it down well so that everything is as clean as a new pin. Here is my pet cow, Jenny," going up to a grade Jersey, which rose as she approached and licked the hand held out to her. "This was the first calf I ever owned, and no one has milked Jenny but myself. I milk four of them; Tom milks four and Hannah milks two. We each milk the same cows; if we were to change cows we should not get so much milk by several quarts. I think it a bad plan to change milkers." We followed our hostess to a yard near by, with a number of pens opening into it. The pens had half-doors, and the upper halves were opened. Here were a number of calves and yearlings preparing for the dairy. Everything was clean; the yard and pens were well bedded with clean straw, and the manure was neatly heaped in a pile in the center of the yard. The calves were evidently pets, and each came to the door and reached up its head to be stroked by its mistress.

"I have fed all these calves," said Miss Martin, "and with Tom's help to carry milk and wheel the milk cart, I can give the whole their milk in less than half an hour. All our calves have skimmed milk until they are four months old, and Tom gives them each a little mess of grass and a handful of bran or meal when they come in at night. Each calf has a separate pen. That prevents them from learning tricks, such as sucking each other's ears, which I don't like to see. Here is the stable. I like stanchions the best; the cows are much cleaner in them than when fastened any other way. I want father to build a new cow stable with separate pens, one for each cow. It would be much more convenient to milk in."

"How do you manage your milking?" I asked.

"We have these stools" (plain three-legged ones) "and milk into tin pails. The milk is strained through a second strainer into the deep pails, and these are taken to the milk-house in a small cart, which Tom has for that purpose. He can take all the milk at once in that, and it saves several trips back and forth, and I don't care about carrying two pails with 30 pounds of milk in each, if I can help it. Each cow's milk is weighed on those scales, which hang there, and the weight is marked on the slate; I copy it once a week into my

book, in which every cow has an account, showing what she milks during the season.

"Here is the milk-house." This was a building about 12 feet square. In the center was a spring, which filled a pool about four feet square, and lined with clean red bricks laid in cement. A step around the pool enabled one to reach the deep cans set in it, which were submerged to within two inches of the top. A cover of wire ganze protected the top of each pail from dust or flies. A tier of shelves ran around the building, upon which skimmers, spare pails, etc., were ranged. A thermometer, hung in the pool, marked 50 degrees; the constant stream flowing out of the pool kept it at that low temperature. An ice-box and a Cooley creamery completed the furniture. A noble black-walnut tree shaded the milk-house and covered it with its sweeping branches. Within a few steps was the dairy-house. This was a building about 24 feet long and 16 feet wide. The door opened into a wash-room, in which were a pump, a sink and a table.

"I don't like to have any slopping in my dairy, and I do all my churning and washing of pans and pails here," said Miss Martin. "Brother Tom helps me churn and our girl, Hannah, helps me wash the pans. Here is my butter-room."

We stepped down about four steps into an apartment with a blue-flag floor. There was a stone bench around three sides, upon which stood a quantity of small stone-ware jars and small wooden pails filled with butter. A table in the middle was made of a large slab of blue-stone resting upon four brick pillars. Upon this slab was the last churning of butter still in the bowl, awaiting the final mixing; a jar of salt and a pair of scales were also upon the table. A thermometer hung upon the smoothly plastered wall, and marked 60 degrees.

"This is a unique dairy," I remarked.

"I suppose it is," replied Miss Martin. "I got the idea from a French work on dairying by Mons. Pourian, and I persuaded father to let me have it it made in this way. M. Pourian thinks that butter absorbs an odor from the floor when it rests upon it, and advises that it should be kept at least 18 inches above it on a stone bench. I like the arrangement very much. We have a drain in that corner, and, if we wish, we can put a hose on the pump in the wash room and wash the stone floor and benches with cold water from the spring. Tom generally does that on Saturday afternoon, and the water runs off and the floor can be dried very quickly, by opening the window and the ventilator in the ceiling. The window is on the north side and we have a ganze screen in it and a tight shutter which can be closed and opened by this handle, without going outside or opening the window."

"Where do you send your butter for sale?" I asked.

"The butter is put up into small jars and white-oak pails, and is sent to New York in boxes once a week. Last week we sent 16, six-pound pails. I get 35 cents a pound for it."

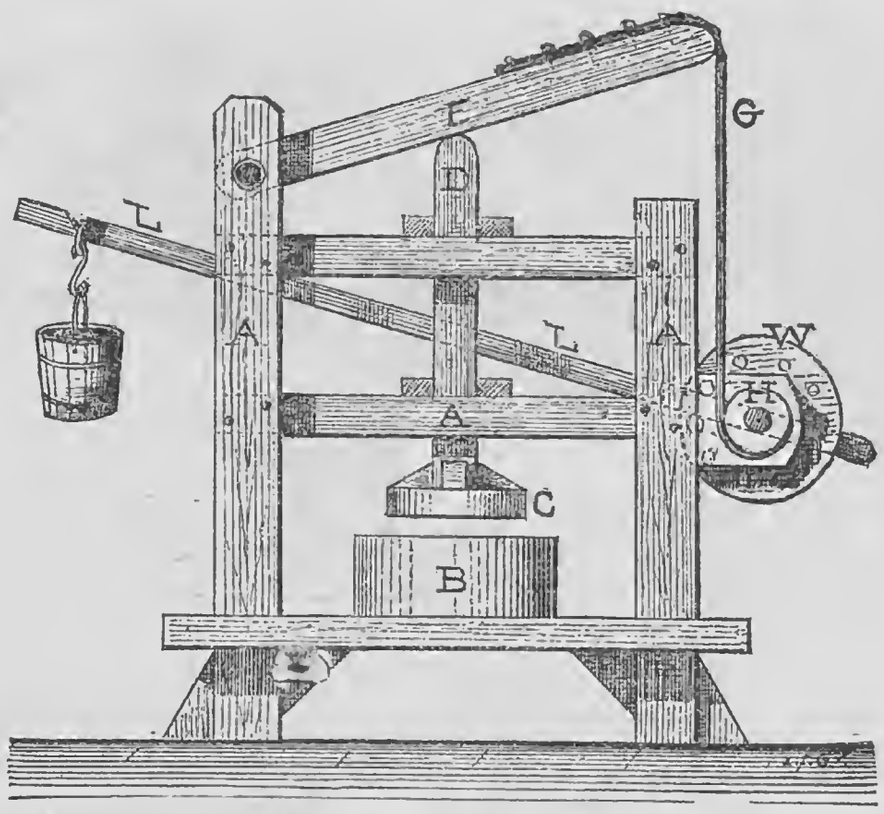
"Mary has a good thing in her dairy, I can tell you," said Mr. Martin. "I consider 25 cents a pound a fair price for butter when all these conveniences are supplied, so we agreed that she should look after the dairy; manage it her own way; and pay me 25 cents a pound for all she makes, and pocket the difference. She gets 35 cents a pound and sells all she can make and wants more cows; so she clears $10 a week for herself; she is satisfied, so am I, and I don't know as anybody has any cause to grumble. She is a good manager and I don't see how she gets along with so little fuss, but she does, and I never yet heard her say she had no time for anything, and never saw her in a hurry. Our cows are grade Jerseys; I make butter; you make milk; and your Ayrshires may suit you, but my grade Jerseys suit my purpose very well. If there is a cow that is the best for the butter dairy, I think it is a half-bred Jersey. A pure-bred may be better, but it would'nt pay to give $250 or $300 for a cow. My whole 12 would not pay for two of them, and we average eight pounds of butter a week, and some will yield 12 when fresh."

By this time we had returned to the porch or rather the old folks were there, the younger were lingering behind and taking their time.

"Now" said Mr. Martin "what do you think of it? We read a great deal about work being disagreeable, but there are people who make work of their business, and others who don't seem to find any trouble about it. As to work being degrading, that is simply bosh. With some it is disagreeable, no doubt; but it seems to me that it is a necessity that all should do some work; and those who don't work, simply live on those who do. Work is not antagonistic to the highest culture in man or woman. Drudgery, I admit, is a hardship and may break the spirit of any person. But no educated person need be a drudge. The drudge cannot rise above his place. He is held there for want of intelligence and ability to rise above it. There are some who make drudgery of their work because they cannot ease it by intelligent management. Brains do more than the hands. I would have every girl and woman take her share of the world's work. We have good old authority for it. When Solomon described a woman endowed with all the virtues, he said: 'She worketh willingly with her hands; she also riseth early, and giveth meat to her household; she layeth her hands to the spindle and her hands hold the distaff; she is not afraid of the snow, for her household is clothed with scarlet; her clothing is silk and purple; she looketh well to the ways of her household and eateth not the bread of idleness.' There is the whole subject in a nutshell. She worked industriously, dressed well and was happy."

In the mean time Fred had been putting many questions to Miss Martin and Tom about their ways of dairying, the pith of the replies being as follows: The milk having been taken in the deep pails to the pool, is there set for 36 hours, when it is skimmed and the cream is set to ripen in the creamery for one day. It is then taken to the dairy room and kept there one day, when it is churned. It is then at a temperature of 60 degrees. As soon as the butter comes, sufficient ice-cold water is thrown in to harden it, and it is then washed thoroughly from the buttermilk, and weighed; salt at the rate of one ounce to the pound is then worked in and the butter is set away in the dairy-room for 24 hours, when it is reworked and packed in small jars or pails, as may be required by the customers. Some like jars, and some prefer pails. On the whole, the jars are better than the pails, as they do not shrink, and Tom is not called on to replace hoops occasionally. Some coloring is used to bring the shade to the proper tint. Jersey butter sometimes requires coloring as much as that of other cows. Fred remarked that they nearly all do it in the fancy dairies. Miss Martin was confident that the feed had considerable influence on the color and quality of butter, and preferred to have the cows supplied with wheat middlings, bran, and corn meal. The butter came solid and hard and of good flavor in the hottest weather. Fifty pounds of ice daily will keep a three-can Cooley creamery at 40 degrees; part of the milk is set in the creamery so as to test the yield of butter. The cream rises completely in 24 hours and the milk is sweet for the calves. So far there has been no difference to note in the quantity of butter from the pool or the creamery; but the more rapid rising of the cream is a great convenience. Miss Martin was very sure that she would not relinquish her dairy business for a good round sum of money. By-and-by dairy matters were exhausted, and when the conversation changed to subjects not of general interest, I bade Mr. Martin good-bye and returned homewards.

A HOME-MADE CHEESE PRESS.



A HOME-MADE CHEESE PRESS.

The above sketch represents a cheese press, all the materials for which can be found upon the farm, and which possesses some points of superiority over the best screw press. A, A, A, show the frame of the press which should be made strong and heavy. It cannot well be made too strong, and the dimensions are left to the convenience of the builder. B. is the cheese hoop; C, the follower, or that which presses upon the same in the hoop. Attached to C is an upright, four or five inches square, sliding through holes in the cross pieces of the frame. At the top it is rounded, as shown. Bearing on this is the lever E, pivoted at F. At the other end is very securely fastened a stout strap of leather G—an old harness tug—the other end of the strap being fastened on the axle H, four inches in diameter. This axle turns in two stout pieces only the farther one is shown—framed out from A. At the back end of axle, and turning with it, is a wheel, W, 15 inches in diameter, made out of two-inch plank, on face of which are a number of wooden pins four inches long. A lever, L, is passed loosely through such of these pins as will hold the lever in about the position shown in the sketch, when the weight may be hung at the upper end as shown, and a great pressure be brought to bear upon the cheese, and that too with very little manual labor. By using a pail and stones for weight the pressure may be nicely regulated. It will be seen that the leverage is double and very great, but may be made as small as desirable. WM. R. BROOKS.

Farm Economy.

SELF-RELIANCE IN FARMING.

PROFESSOR E. W. STEWART.

PROBABLY no class prides itself more upon practical knowledge than the farming class. They never cease to intimate that many of the so-called improvements in agriculture are not founded upon a practical basis, but rest merely on plausible theory. Theorists are held in the same estimation as vagarists. Farmers require everything to be worked out in practice before they place value upon it. And with a class claiming to be so intensely practical, ought we not to expect great independence of judgment—that they would work out every part of their business in the most self-reliant way—basing their conclusions upon all the circumstances affecting the business? This would be a most favorable conclusion for this great industry, if the farming class did really decide everything upon independent judgment.

But when we study the commercial operations of farmers, very little self-reliance is found. Take as an example their dealings in factory associations. Their ideas of handling dairy products are often very crude, and likely to lead to losses from the want of prompt action. Some factory managers, finding it difficult to manage the sales with so many discordant advisers, seek to purchase the milk of their patrons so as to have the control of the the product. But they are seldom able to do this, although they offer a price higher than the market is likely to warrant, thus risking a part of the price of manufacture, because the average dairy farmer does not study the market attentively enough to form a judgment upon the real value of milk. In other words, he does not attempt to form an independent judgment upon the value of his own commodity, but thinks the owner of the factory has some superior knowledge which will enable him to speculate upon his milk, and refuses the offer. I hear of a number of cases, in Erie and other counties of New York, where offers of 60 cents per 100 pounds of milk were freely made in early spring, but nearly all the patrons rejected the offer, preferring to take their chances of dividends. This offer was equal to an average of 7½ cents for cheese during the whole season, quite as high a price as any of the best judges believed it would bring; and much higher than now seems probable. Here the dairyman has all the means of forming a judgment upon the question, which anybody possesses. The reports of the dairy markets are all open to him, but he neglects to study them, so as to be able to estimate the probable value of milk. He leaves this matter, so important to his own interest, to the party whom he thinks will determine it for his own advantage and not that of the dairyman. How far this is from any proper self-reliance, how far from such practical knowledge of his vocation as the farmer needs! How long would the mercantile class be successful with such indifference to its own business? Would it be possible for the cotton manufacturer to succeed without a closer estimate of all the elements of his business?

But if we examine his keeping of accounts with the factory, we shall be still more surprised at his absolute dependence upon the factory manager. Three-fourths of all the patrons of factories do not even take the trouble to keep any account of the milk delivered. Instead of studying all the elements required for a full understanding of the business of dairying, they keep no account of the separate yield of each cow, or of the whole yield of the herd; and if asked the average yield of their cows, not one in twenty can answer. If asked the product per acre of grain, or weight of hay per acre, they are equally unable to give any accurate information on the subject. Is not this a sufficient explanation of the comparatively slow progress of agriculture? The farmer, instead of studying practically such details of his business as will render him competent to judge of the commercial value of his products, leaves his interests almost wholly in the hands of the middle-man, and then complains that farming does not pay. What other business would pay under the same circumstances?

This is a plain statement of the manner in which the great majority of farmers carry on their business. Does it not show that the farmer sadly needs a more practical education in his business, and that self-reliance is one of the least of his virtues?

MONEY-MAKING MEN AND WOMEN.

MERCHANTS and manufacturers who have made money and become wealthy have done so by having something good to sell and by continuing to sell such articles as will give satisfaction. Farmers can make money by adopting the same rule of always having something good to sell and by selling such things as will please the purchaser. The same necessity exists that a farmer should understand his business as that a merchant should understand his, and there is very little chance for a farmer to make money who has to employ others to buy and sell for him and who has, all the time, to be asking advice of neighbors. How would it look for a manufacturer to be obliged to find out through others what to make, or for a merchant to seek counsel of other merchants.

A genuinely clever, business-like merchant ascertains what suits his customers, and procures those styles of goods; and so it is with a money-making farmer—he studies the state of the market and finds what kind of animals sell for the most money, when everything has been reckoned up and the cost of food and attendance has been deducted; and as some kinds of farming stock require but little attendance, and yet sell at a high figure, that is the sort any shrewd, wide-awake farmer will breed. Now, a merchant or store-keeper should always deal in such goods as will not be left on his hands as so much dead stock. There are, however, some who every year have such a quantity unsold that at last the things have to be marked down to such a low figure that the loss incurred on them is serious; and if readers of this will mentally cast their eyes around, they will readily see men who, in agriculture, are making the same mistake, for they have on their farms every year some kind of stock which cannot be sold at a price high enough to pay for the cost of producing it. Like the store-keeper who has gained by a portion of his stock and lost all the profits on account of his unsalable wares, so these farmers, by keeping on hand inferior animals, which have to be sold at a loss, lose more than was gained by the best sales.

Good judgment is lacking in such cases, not only in buying and keeping second and third-rate stock, but in the management of it. Nothing can be more absurd than for a man to buy up or breed a low-priced set of animals, and think because they are in his hands they will be worth more than in another man's. It is perfectly ridiculous for any man to suppose his name alone will be sufficient to enhance the worth of what he has to sell; for his name, or any one's, is of no use till he has distinguished himself by proving his judgment in possessing choice animals.

In all cases where a man or woman makes money, a uniformly good system is adhered to; for there never was any money made, and never will be, by any one who is all the while changing his stock, and having first one and then another man in charge of different parts of his business. Agriculture requires system, and it will not do to be hot one day and cold another about anything. To use a common, homely expression—farming cannot succeed when there is any "fooling" about it. There must be a good system decided on, and then "stuck to," under all common circumstances to secure success in farming as well as in all other kinds of business. G. G.

Farm Topics.

THE TRUTH ABOUT IT.

[The object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

DOES INSURANCE AGAINST FIRE COST TOO MUCH?

Without doubt it does. Notwithstanding the fact that we are constantly seeing companies retiring from the business because it doesn't pay, it is still true that the public at large pays more for insurance than it could be afforded for. We are pointed to the risk assumed; we in return point to the dividends declared. A president of a New York company told me to-day that notwithstanding the heavy losses sustained by the great fires of Chicago and Boston—which at that time seriously threatened the continued existence of the company—the average dividends had been 8½ per cent. since the formation of the company, some twenty-five or more years ago. Another company, the twenty-fifth anniversary of whose organization was celebrated last fall by the directors and their friends, who ate a Delmonico dinner at the expense of the stockholders, boasts, we are told, of an average of fully 14 per cent. dividends during its whole existence. And these are not exceptional cases. I admit that insurance stock should pay large dividends—10 per cent. in expectancy, and all the risk, is not really so good for the investor as six or seven per cent. on a sound bond and mortgage.

But we are sure fair dividends can be made and still insurance be furnished for a less rate than that charged at present. The trouble is, it costs too much to run the business. At least one-third of all the money received for premiums in New York, is expended in paying the running expenses of the companies. This is too much. In the first place, too high salaries are paid; expenses are not economized. I have in mind one company whose capital was less than $200,000. Its president and secretary received $15,000 a year, beside a certain amount charged to expenses allowed by the directors for the entertainment of visitors from abroad, of which no items were rendered. Moreover, an agency for an out-of-town company was kept at this office, not a penny of the profits of which ever reached the stockholders. If complaint was ever made, the dividend account was pointed to, with the query "Ought you not to be satisfied with that?" The insured pay the difference.

There are too many insurance offices, with their managers' clubs, etc., to be supported. In New York alone are sixty-five companies, whose capital aggregates less than $14,000,000, or a little over $200,000 each. Now, suppose these sixty-five companies were consolidated into fifteen, what would be the saving in the expense of their management? In the first place, there are fifty presidents and fifty secretaries less to salary. The clerical force would not be reduced in proportion, but it could be largely curtailed. Rents, stationery, and every item of expense would be reduced, and the same amount of business done at probably one-quarter of what it costs now. The stockholders could have their usual dividends and the savings be applied to the reduction of rates of insurance.

Local companies are complaining bitterly because foreign institutions come here and cut down rates. They can afford it. They have large capital and proportionably small expenses.

The truth about it is that these little companies are usually gotten up by somebody to secure a nice paying position for himself and his friends. Examine closely into the matter and you will find them, to a great extent, family affairs or governed by a ring for its own interests. L. A. R.

Field Crops.

NOTES FROM RURAL FARM.

Pearl Millet.

It is now the 23d of July. Pearl Millet averages less than 10 inches in hight, and it requires a passing amount of faith to believe that it can still be cut four times (as some distinguished writers have asserted) before frost. We have faith that our plants will attain an average hight of eight feet or more, because we tested it thoroughly last year. But we do not believe that it can, in this climate, be cut advantageously more than twice. The disposition to exaggerate the value of new plants by those who have a hand in their introduction or dissemination is greatly to be deprecated. In the end, those who sell the seeds or plants and those who, with insufficient knowledge, publish inaccurate accounts of their good traits, are alike injured with those who are induced to purchase the seeds and cultivate them. Alongside of our Millet is a plot of

Doura.

There are several varieties of this, which are distinctly marked. Some scarcely ever produce a sucker, but develop a single tall, heavy stem, with very broad leaves somewhat clustered at the top. If these be cut off at any time, that is the end of growth. But the variety of which we speak tillers remarkably, and, when cut off, at once continues to grow as if it suffered no check in consequence. Now, while Pearl Millet is, as we have stated, not over 10 inches in hight, this is three feet high and each plant, on an average, has at least six stalks. We are cutting it from time to time, so as to be able to report later how many times it may be cut and how much green food it may thus be made to produce per acre.

Beauty of Hebron.

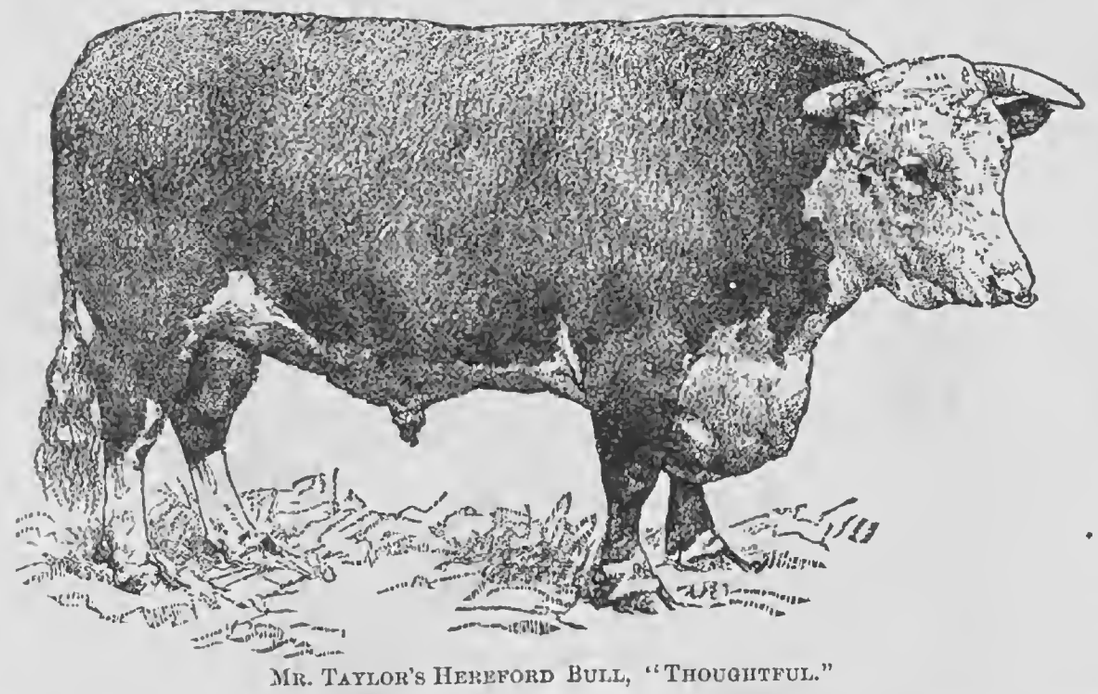
We are more than ever pleased with this variety. Last year we tested it beside Early Rose, and found it a few days earlier. This year we have about a quarter of an acre of each, but the Beauty of Hebron was planted 10 days later. The yield, so far as can be guessed at from digging a hill here and there for family use, will be more than one-third greater than that of Early Rose. Of course, we shall measure the two yields and report definitely at the proper time.

Oats.

Among seven sorts of oats tested this season, we have reason to think very highly of two new sorts called "Mold's Black Tartarian" and "Challenge." The first bears the heaviest and most compact panicle as well as the heaviest straw of any variety we have ever raised, and our neighbors pronounce the same opinion as to their experience. We may have something further to say of this variety that will especially interest our farmer readers. Our main crop of oats has this season been the largest we have ever raised. The field was broken up seven years ago, manured with bone flour, sown to rye and seeded to timothy and clover, in which it was kept until last year, when corn was planted, with Mapes's corn manure in the hill only. This spring we sowed, at the rate of 600 lbs. per acre, a special concentrated fertilizer for oats, with the result as above stated. The yield per acre will be given as soon as we determine it. The field was cut the 15th inst.

Blunt's Corn.

We have just visited a plot of this corn, which was entered for the Rural premium. It was planted in garden soil and manured with fish, two to a hill of three seeds. Some of the stalks are now 10 feet high and most of them over eight. The severe drought which at present prevails is curling the leaf, and, of course, interferes with the setting of ears. Few stalks as yet show the tassel. Upon one of these we counted five sets. Upon others there was no sign of a set—the tall, thick stalks looking decidedly barren. The interest manifested in this corn hereabouts at this time runs high, and we hope that the *finale* will not disappoint the "Great Expectations" that have been raised.



Mr. Taylor's Hereford Bull, "Thoughtful."

Miscellaneous.

WHAT OTHERS SAY.

Mixed Grasses.—An editorial in the New York Times says that the common grass, timothy, has usurped too high a place in the opinion of farmers. It may be that there are other grasses that equally deserve a place in our practice. As a rule, mixed sowings, whether of grain or of grass, are the most productive. So a mixture of grasses will produce more pasture and more hay than any single grass. This is seen in the usual mixture of timothy and clover, which yields a double crop. If orchard-grass is added to the mixture, a still further gain is made. If blue-grass is added, bottom growth, which is most valuable for fall pasture, is secured. The following mixture, viz., six pounds of timothy, six pounds of red clover, 20 pounds of orchard-grass and 20 pounds of Kentucky blue-grass, will give three cuttings or crops in one season. It has done so with the writer. The first cutting was made on the 10th of May; the second is in progress at the present writing (July 10), and a third will undoubtedly be made in September. The first cutting consisted of orchard-grass and clover; the timothy had not then reached a sufficient hight; the second cutting consists of timothy and clover, with a thick bottom of broad leaves of orchard-grass; the third crop has heretofore been, and will be, pasture, and will consist mainly of blue-grass, orchard-grass and clover. A liberal top-dressing of coarse manure will make up for close pasturing, and will protect the sod during the winter and hasten growth in the spring.

Firming.—S. M. Carr says that last spring he planted four rows of potatoes, and on every piece dropped he stepped, bearing his whole weight. Those rows are finer in appearance than any others he has seen this year.—*The Husbandman.*

Pear Blight.—No unfailing remedy says the Husbandman, has been discovered, although there is hope that a course of treatment employed by Mr. M. H. Wells, of Elmira, with apparent success, may prove effective in general practice. He syringes the whole top of an affected tree with a weak solution of potash, and he has made so many experiments resulting in cures, even where the disease has been well established, that he has no doubt of the efficacy of the treatment. By way of testing the virtue of the application he has used it on leaves partly blighted, with the surprising effect that the disease has been arrested at the precise line of its progress where the solution has been applied, the healthy portions of the leaves remaining thereafter wholly free from blight.

Insects.—The Country Gentleman, in "Timely Topics," says that an efficient mode for clearing destructive insects from small crops might be more extensively and profitably resorted to in the employment of boys to gather them, paying for the hundred or measure. Those who have a quick eye and ready fingers will reach them more easily and do more than men. Try the experiment early in the season, when "potato bugs" appear, and give them a specified sum per quart. In the same way they will keep clear a patch of cucumbers or squashes, using a pan with a thin coat of molasses in the bottom, to secure their prey. We discovered, many years ago, that the white grub was destroying a valuable plantation of seedling Pears. Fifty cents per hundred to a few young boys brought them in, and as the insects became scarce a double and quadruple price produced a wild excitement among the little fellows, and every straggler was cleared. The sum paid was small; the saving of the crop was of great value. The same remedy may now be applied to the green cabbage worm, and when they are not numerous, the riddance is easy.

Of the Curculio, the writer says that the crop of plums which set on the forty trees in his small orchard was observed this season to be quite moderate, and as soon as the calyx had fallen from the young fruit, the curculios began their work in vast numbers. The jarring system was promptly commenced, and in the first two days over 1,200 insects were caught and destroyed. For some days, and while they continued in large numbers, the trees were examined twice a day, and afterward only once a day. The work was continued thirty days, and over 4,100 in all were caught. The result of this close vigilance and constant work is a fair crop of plums, and the cost of saving them only fifteen hours in the aggregate, or not five cents per tree.

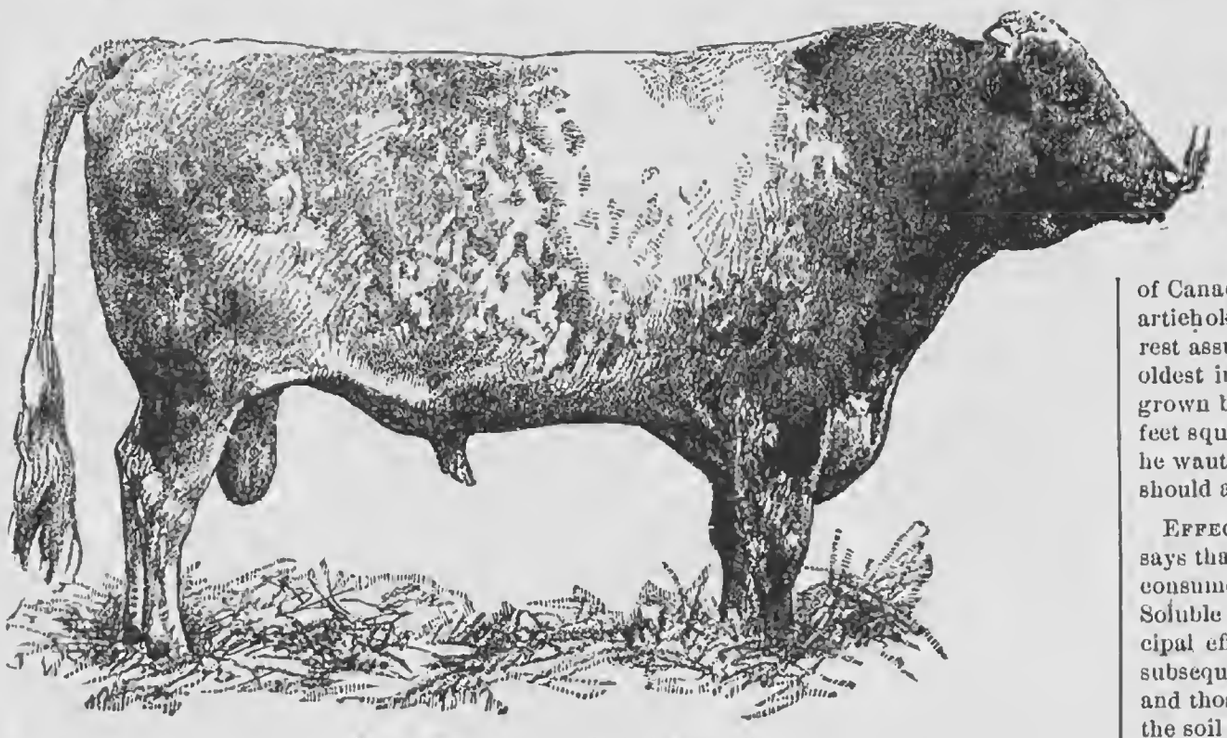
Renovating a Poor Farm.—Our friend Mr. M. B. Batcham speaks of our esteemed contributor, Mr. W. I. Chamberlain, in the Ohio Farmer, as follows: "He was a graduate and tutor in Hudson College, but some ten years ago he purchased an old clay farm of about one hundred acres, a mile or two east of the village; it had been long run as a dairy farm, and was considered too poor to produce much else than light crops of grass. Mr. C. resolved to attempt its renovation as fast as it could be done by dint of labor and intelligence. At first the gross income from the farm was only about five hundred dollars annually, and the expenses exceeded that sum; but for several years past the products of the farm have been from three to four thousand dollars annually, and the cash value of the land has more than doubled.

I have not time to speak of all the methods by which this renovation has been accomplished. Suffice it to say it has not been by large expenditure of money, but chiefly by the use of educated brains and persevering industry. The chief factors in the work, I may say, are thorough drainage along with judicious saving and use of manure. At first, he was told that wheat, potatoes and apples could not be grown to advantage on such clay lands; but for several years past he has grown the best crops of these in the township, and last year, it is believed, he had the best ten acres of wheat in the whole State, on one of his underdrained fields—the yield being over fifty bushels per acre."

Artichokes.—A Country Gentleman correspondent says that it took him five years to exterminate them from the ground, but by so doing it made this, and the peach trees on it, the best trees and ground on the estate. He can eradicate five crops of Canada thistles easier than one of Jerusalem artichokes. Put them once into the ground, and rest assured they will eventually become the oldest inhabitant. He recommends them to be grown by every dyspeptic individual, as twenty feet square of them will give him all the work he wants in trying to root them out. Farmers should avoid them as they would the plague.

Effect of Manures.—Dr. R. Warrington says that no dressing of manure is completely consumed by the crop to which it is applied. Soluble and active manures produce their principal effect at once, and are of little benefit to subsequent crops. Manures sparingly soluble, and those which must suffer decomposition in the soil before they are of service to the plant, as bones and farmyard manure, will on the contrary produce an effect over many years. Farmers have a prejudice in favor of the latter class of manures, but it is clear that the quickest return for capital invested is afforded by the former class.

Gen. Diven says that he has raised turnips



Lord Rathdonnell's "Anchor."

with corn many years and has never had reason to suppose the corn crop was at all lessened by the turnips, for really they are not an interference. They make nearly all their growth after the corn is ripe.—*Elmira Farmers' Club.*

Hot Weather.—Beware of drinking too much cold water while you are working in the sun, and do not plunge suddenly into a cold bath."—*Weekly N. Y. Herald.*

To Plaster a Cistern.—It is of importance that a cistern should be properly plastered in order to make it tight and lasting. A correspondent gives the following directions: Procure one barrel of water-lime as new as possible, and two barrels of clean sand without gravel or small stones; in a long box of a convenient size mix one part of lime to two parts of sand while dry. When thoroughly mixed, pour in water till it is thin enough to spread, and spread it evenly over the whole cistern. This done, close up the cistern and leave it a week or two to dry. Then mix another pailful of lime with two pailfuls of sand, as before, but make it thin enough to be put on with a whitewash brush; put on this last coat and the job is done.

Remedy for the Squash Borer.—If the squash vines suffer from the borer it is recommended to dig a trench a few inches deep, for each vine, and cover it up, of course letting the leaves reach above the earth. The borer destroys the plant near the root, but vines thus buried. will send out roots along the stalk, and there will be squashes in spite of the pest.

Industrial Societies.

EUROPEAN CORRESPONDENCE.

The Great Agricultural Show at Kilburn.

London, July 11.

The largest and finest show ever held by the Royal Agricultural Society of England during its existence of forty-one years, has just ended in the saddest failure that has tarnished its records. In the number and character of its exhibits the display of agricultural products, tools and machinery, that has just closed at Kilburn, far transcends any similar exhibition hitherto gotten up in any country; but in comparison with the high expections entertained of its instructive and financial results, no like undertaking has ever turned out such a miserable fiasco. At the lowest estimate 500,000 instruction and pleasure-seeking visitors were expected to be present; less than 200,000 attended; a considerable addition to the funds of the Society was confidently counted upon, it will be fortunate if its reserve surplus will be sufficient to meet the heavy deficit of at least £15,000 incurred. It can hardly be said that this woeful disappointment was due to mismanagement of any sort; if any fault on the part of the managers contributed to the mishap, it was mainly a want of foresight in estimating the results, in the way of locomotion, which a combination of heavy rains, heavy land and heavy traffic must bring about.

Seventeen years ago, when the society held its only previous metropolitan show at Battersea Park, on the Surrey side of the Thames, a money loss of £4,000 was incurred, although there were 125,000 paying visitors; and in view of this experience and of the risk of a slim attendance, that might be inferred from the extreme uncertainty of the weather in this country during the present year, there might have been a trifle of imprudence in the Society's incurring a liability for about £40,000 ere the show opened, although only about £8,000 had been collected in aid of the enterprise from the city of London and subscribers elsewhere. The spirit that animated the managers, however, in getting up so splendid an agricultural display at this season of extreme agricultural depression, was worthy of no stinted praise, while their efforts to accomplish a brilliant success in the face of all mishaps, was unflagging to the last, and England's reputation for liberality will be sadly besmirched should such conduct be permitted to bring loss or reproach upon its authors. With the exception of the possible imprudences mentioned, the failure of the exhibition was entirely due to the execrable weather, and as this is a matter regulated by the sun, the cause of their misfortune was upwards of ninety millions of miles beyond the control of the luckless managers.

The Site of the Fair,

at Kilburn, in the northwestern outskirts of London, was, six or seven weeks ago, a low, flat pasture of a trifle over a hundred acres of stiff clay soil. Since its selection as the scene of the exhibition, the Society expended more than £2,000 in draining it; but, owing to the very tenacious nature of the soil, the underground drains failed to work well. The place is readily accessible from all parts of London by means of three railroad lines, quite a large number of omnibus lines and two tram or street car lines converging from the north and east. It is also within easy reach of the aristocratic regions of Pimlico and Belgravia, through Hyde Park by way of the Marble Arch, from which it is distant only a couple of miles, straight up the Edgware Road.

The fair opened on Monday, June 30, and closed on the following Monday, so far as the cattle and most of the other departments were concerned, but owing to the scant opportunity the weather allowed for properly exhibiting the machinery, that department was kept open, at the reduced admission fee of one shilling, until the following Thursday, and so deep is the mud at present that there seems little prospect of the removal of any of the heavy goods perhaps for weeks to come.

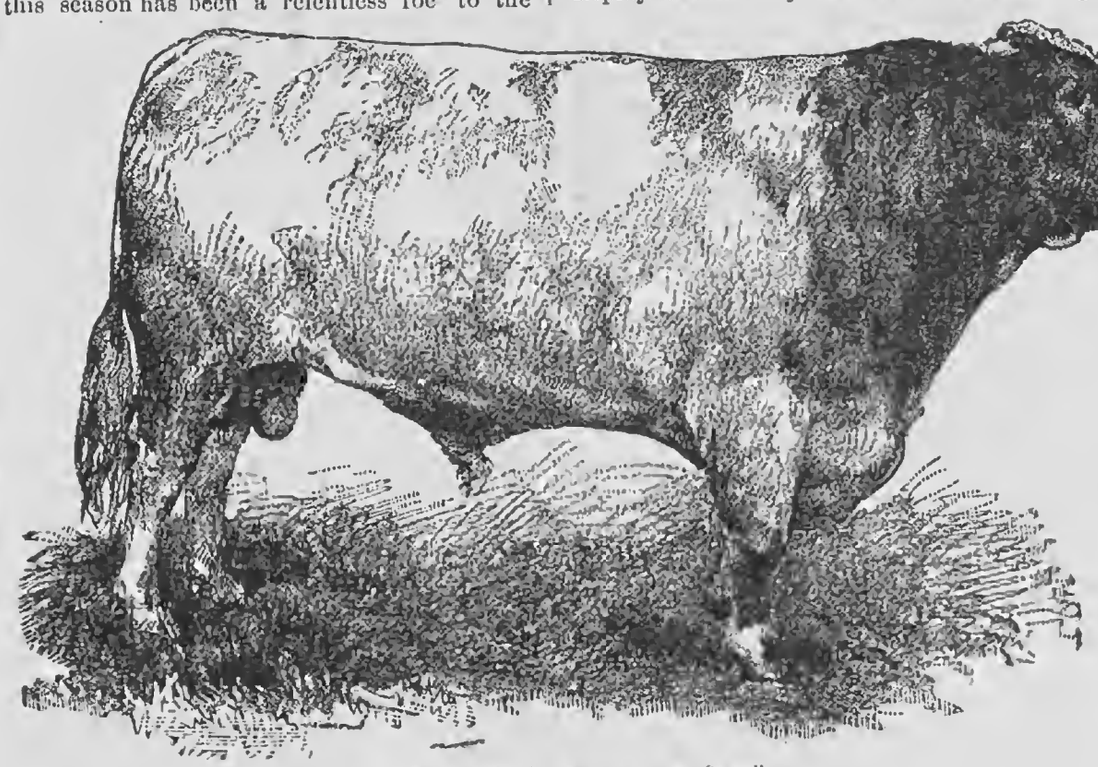
The Weather

this season has been a relentless foe to the farmer. Not content with having cut woefully short the just rewards for his labors in the field, it has now rendered abortive his best efforts to make this, his great annual show, a success. For weeks before the exhibition opened, it rained so frequently and heavily that the fair ground was seldom dry, and the incessant travel on it just before the opening, by men, cattle, horses, carts, heavy wagons and ponderous machinery, made it a deep, muddy fallow cut up in every direction. The first day of the fair was bright with sunshine, hope and the presence of the Prince of Wales, and a large cortege of nobility. The Queen was to visit the place the next day, and her appearance was expected to attract an enormous throng, as it usually does. Next day, however, instead of the "Queen's weather" which has become proverbial for its geniality, a dense, dun-colored fog overspread the earth, like a pall, through which descended torrents of rain. Early in the morning Her Majesty telegraphed that the downpour would prevent her from coming and the few visitors that had ventured to the place in hopes of seeing her, moped wretchedly about or retured home. Next day was fine overhead, but underfoot the ground had become an adhesive bog through which venturesome pedestrians plodded laboriously along besmirched with the glutinous clay, while those less bold, paid more attention to picking their way than to the instructive sights around them.

On Thursday it rained again, and again on Friday, but on Saturday morning it brightened up long enough to allow the Queen to make nearly an hour's visit. After that, until the final close of the fair, on the day before yesterday, I remember hardly a single morning or afternoon which was not spoilt by one or more showers. The ground grew simply execrable. Pedestrianism over the vast area became in all places difficult, and in some places impossible, in spite of the tireless labors of the management to remedy the evil. Thousands of planks and a hundred tons of wattled hurdles were laid down to form foot-paths, while burnt earth and innumerable old railroad sleepers were placed on the roadways to render them passable. The mud, however, was ubiquitous. It oozed up through the interstices of the hurdles, and in many cases completely buried them. It covered the planks, and rendered them as slippery as ice. It gave its own yellowish hue to the clothing of the visitors and to the coats of the stock. The condition of some of the latter was truly pitiable. Many of them, worth several hundred pounds, were lying or standing in pools of water, with their normal appearance and, it is feared, their health, seriously impaired. Trenches were sometimes dug round the stalls, but these soon brimmed over and failed to keep the lairs dry. In many places the men in charge of the animals, having vainly tried to provide comfortable quarters for their proteges, might be seen stretched by their sides and sharing their discomforts. Those whom duty or pleasure brought to Kilburn Fair are not likely soon to forget its countless annoyances.

The Arrangement of the Fair,

however, was excellent. From the main entrance a broad roadway extended to the other end of the immense field, dividing it into two nearly equal sections. Along this ran a tramcar impelled by steam, which afforded the public an easy means of locomotion. On each side of the central avenue, at right angles to it, stretched long rows of temporary sheds for the shelter and display of exhibits. For convenience of access, four cross avenues, parallel with the central one, two on each side of it, cut these rows of stands at nearly equal intervals. Just inside the boundary wall, on each side of the main entrance, extended the sheds for the display of all kinds of seeds, foods, manures, models, etc.,—and a splendid display it was. Beyond these and stretching



LORD EXETER'S "TELEMACHUS 9TH."

along both sides, were ten shedfuls of machinery in motion, driven by a crowded line of steam-engines, nearly a mile in length. Beyond the seed stands were rows of sheds for the exhibition of implements; then sheds for cattle on the right of the central avenue, and for sheep and pigs, on the left. Then, on the left of the avenue came seven long stables for horses, and between them and the avenue, which here curved to the right, and were the Grand Stand, the large horse ring, and three small rings for the display of other stock. Beyond these were numerous restaurants, together with the dairy department on the left of the avenue, the stable for foreign horses and other stock, on the right. Every exhibit was plainly numbered in its proper department in the appropriate catalogue, and a corresponding number affixed to the stand close to it, so that full information, with regard to everything, was accessible to the visitor in possession of two catalogues which were sold for a shilling apiece. Some idea of the magnitude of the show may be formed more clearly from a few brief facts than from a long disquisition. The total entries of live stock amounted to 2,874 including 1,007 entries for cattle; 841 pens of sheep, and 211 pens of pigs. There were 815 horses, ponies, mules and asses, and the total length of shedding occupied by live stock, was six miles. The seeds and models occupy 2,220 lineal feet, and the sheds for machinery in motion, 4,683 feet.

A mere mention of a tithe of so many objects deemed worthy of display as among the best or most curious of their kind, would occupy far more space than the Rural could spare. Acting, therefore, on the principle that few of the readers can miss the good things I've not spoken of, I shall merely refer to a few of the exhibits likely to be of most interest to transatlantic readers. First of these come

The American Exhibits.

These were remarkable, not from their total absence, but from their extreme paucity. As the exhibition had long been widely advertised as an international affair, it was certainly to be expected that the United States would make a fine show of the agricultural products which she is sending so abundantly across the Atlantic. This expectation, however, was blankly disappointed. Of the few exhibits from that country, by far the most noteworthy were those of the agricultural implement makers, several of whom have large establishments in this country also. There was not a single head of stock of any kind shown by an American—not even a dead carcas, although several prizes were offered by the Corporation of London. A solitary St. Louis firm, however, exhibited canned beef. There were a dozen samples of American butter, Mr. Murray, of New York, winning one prize, and Mr. Stewart, of Farley Creamery, Iowa, another. The transatlantic competition in cheese was represented by just a dozen specimens shown by a Mr. G. Morton, a Canadian.

The Exhibition of Cattle

was larger and finer than at any former show in this country. As usual, the Short-horns attracted the greatest amount of attention, and a splendid lot they were. Of the three judges of this breed, one had been selected from England, another from Ireland and the third from Scotland. In the class for bulls over three years old, the first prize was won by Anchor, an Irish beast, that bore away the first prize in his class at the Dublin fairs three years in succession. He is a remarkably high animal, but deep proportionately. He was bred by Mr. Richard Chaloner, of Moyalty, County Meath, but is now owned by Lord Rathdonnell. A special prize of £100 for the best Short-horn bull at the fair was awarded to Telemachus 9th, the property of Lord Exeter. This award did not give general satisfaction, as many were of opinion that the prize should have been given to Anchor. Mr. Chaloner, the breeder of the latter, was the Irish judge, and declined to give an opinion in this case. Of the two other judges, one was in favor of Anchor and the other of Telemachus. A third was then selected, who, after some hesitation, voted the honor and cash to Lord Exeter's beast. Another special prize of £100 for the best Short-horn cow was won by Mr. Hutchison's Gainful The same owner's Grateful, Mr. Foljame's Azucena and Lord Fitzhardinge's Lady Wildeyes were first in their respective classes, while Sea Gull, with her two fine sons, Telemachus 6th and 9th, and her daughters, Sea Bird and Sea Lark, carried off the prize for the best group of mother and two or more offsprings. Of Herefords there were only 62 entered, but some of these were remarkably fine animals. The champion prize of £50 for the best bull of that breed at the fair, was won by Mr. Roger's Grateful, which also was awarded the first prize for bulls over three years old. Many thought Mr. Taylor's bull Thoughtful, which was placed second to him, would rank first. Both are excellent specimens of this fine breed.

—[Continued next week.] Theber.

Industrial Implements.

THE PERFECT HOG-RING.

Mr. J. H. Brown, of Ottawa, Ill., sent us, some time ago, some of his "Perfect" hog-rings for trial. We have used the ring on the Rural Experiment Farm, and have also distributed some among neighbors. We can say that the rings sustained the claims made for them, and have proved entirely serviceable. Several peculiarities of construction commend them. The ring—coppered wire—is smooth in the animal's nose, the point being pushed quite through and into the loop above the snout, when it is bent slightly forward, making a secure fastening. We noticed, too, that the point works down and points over the nose, and acts as a barb if the animal attempts to root, but hangs without causing irritation when rooting is not attempted. The perfectly smooth wire works easily in the nose, and we did not observe an instance where the snout was at all in a festering condition; hence there could be no liability of the ring's working out of the nose.

We have had an illustration made of the rings before and after being locked, which shows how it is operated. It is a simple matter to slip on the ring the discs we have shown, which can, very conveniently, be stamped with distinguishing marks. Mr. Brown may be communicated with, if further information is desired.

THE WOOD BINDER.

In the report of the machinery at the important fair held in Kilburn, Eng., the Agricultural Gazette, speaking of the Wood binder says: "Since last year the binding apparatus has been improved and the capacity of the machine for cutting, elevating, and binding heavy crops increased, whilst it will bind light crops equally well. Mr. Wood has been guided by the experience of those using his binder. The writer has examined the machine in a field of overripe wheat matted with bindweed, when he had different speeds tried, and found that the faster the horses moved the better the delivery. Along with some farmers present, he could not find any shedding of corn from the fall of the sheaf, whilst it is, moreover, free from the liability of being dragged along. Before leaving Mr. Wood's binders it is but fair to state that since last year he has been instrumental in setting at rest the prejudice against wire by the introduction of magnets. Through the indefatigable exertion of his agents throughout the length and breadth of the United States, millers and farmers now join hands in favor of wire binding; and whilst magnets are empowering millers to grind finer flour for the English market, English farmers and millers can only fight this battle of opposition successfully by using the same weapons, viz. wire binders and magnets."

Everywhere.

RURAL SPECIAL REPORTS.

CONN., Campville, Litchfield Co., July 23.—I saw a statement in the RURAL of premium corn measured July 9th. On July 5th we measured that sent us, and found the stalks six inches in circumference and six feet high. We measured again this morning, and found the stalks 10 inches in circumference and 10 feet high. If the corn ripens, we hope to show good results next fall, and "haul in" some of those first-class premiums. G. A.

N. Y., Whitney's Point, Broome Co., July 23.—The weather has been very "catching" for the last two weeks. Haying is well advanced. The hay crop is about one-third lighter than last year. Farmers have nearly all harvested their wheat in this section; it is only about half a crop this year, owing to the dry weather in the spring. The wheat sent me by the RURAL looks good, but the seed did not all come up. Blunt's corn, planted on the river flats in black loam, looks nice and stands about five feet high. Pearl Millet is a failure. Beauty of Hebron potatoes, after having been cut down to the ground by the frost, came on and are now looking fine. Oats promise a good crop and will be ready to cut in about ten days. Potatoes are thriving, and if they do not rot in the hill they will be a large crop. Sheep and lambs, $3.50@4 per head; veals, $3@5 per head; eggs, 11 cents per dozen; butter, 12 cents per pound. M. B. D.

N. Y., Rome, Oneida Co., July 20.—The weather has been extremely hot most of the time for the last six weeks, with occasional showers. This is very favorable for corn. Ours is as large as it has ever been at this date, while our "RURAL Blunt corn" is far beyond any that we ever saw so early in the season. It stands from eight to nine feet high, and there are no signs of tassels yet. I wonder how high it will grow. Potatoes are looking very fine, but the second crop of "bugs" is hatching out. The rain improved newly-seeded meadows, but old meadows yield poorly. Oats look good. Winter wheat is being harvested, but we cannot say how it will yield, as we have none. A large share of the apples seem to be dropping off. Plum trees are hanging full.

F. D. P.

N. Y., Oriskany, Oneida Co., July 23.—Corn hereabouts is good. It was planted about May 20, with hen manure in the hill in my own case. I planted 58 hills of Blunt's corn, and it is four feet high and doing well. S. C.

NEW JERSEY, Burlington, Burlington Co., July 24.—The Blunt corn is looking fine, considering the fact that we have had no rain for over two weeks till last night. It is setting from three to nine ears per stalk. If the dry weather had not come, I would have had a fine little piece of corn. As it stands—12 feet high—it is the largest corn in this neighborhood. The drought cut everything short. If it had continued one week longer, farmers in this vicinity, a number of them at least, would have gone into bankruptcy. H. T. W.

NEW JERSEY. New Brunswick, Redfield, July 16.—Crops are looking good and are growing very fast. Farmers have got nicely to work securing the hay crop, which is an average one. Oats promise to be more than an average crop. No wheat, to speak of, is grown here. Corn and potatoes promise large yields. Prices are very low; cheese, 5½ cents; butter, 10@12c.; potatoes, old, 75c.; new ones are not yet large enough for use. P. M.

PA., Berlin, Somerset Co., July 21.—I have 95 stalks of corn from the seed I received from the RURAL. They look fine, and so do all other crops here. Hay is a little short, however, on account of dry weather. Fruit, too, was damaged in some places by late frosts, but there will be an average crop. Butter is very low, selling from 8 to 12½ cents per pound. Everything else brings a good price. G. B. P.

OHIO, Cincinnati, July 21.—It has been fearfully warm here to-day. No rain hereabouts in three weeks. L. K.

IND., Newton's Retreat, Tippecanoe Co., July 19.—The wheat harvest is over and haying is just commencing. Oats will be short, owing to the dry weather, but will yield pretty well and will be ready to harvest in about a week. Hay will be scarce in this county, as there are very few meadows, and what there is will yield about a ton and a half to the acre. Wheat is above the average this year, both in quality and quantity, a thing that brings joy to the hearts of hundreds of farmers, as a great many farms are under mortgage, and without a bounteous harvest the mortgages will be foreclosed and the farms will pass into the hands of some city chaps. It is a pity that all the farmers of our State did not practice the cash system set forth in the RURAL. New wheat is selling for 95 cents. D. C. A.

ILLS., Equality, Gallatin Co., July 19.—Crops were never so good in this part of the country as they are at present. Wheat used to be called good if it averaged 10 bushels per acre; this season it will average 20 bushels. The Blunt corn you sent was so small-grained that I was tempted not to plant it; but concluded to try it. I acknowledge I was badly fooled. It beats anything I ever saw in the way of stalking, suckering, shooting and silking. If the ears are large enough, it will "do." I did not have any Early Rose potato to test with the Beauty of Hebron. The one you sent was very small—it only had 10 eyes on it. I cut it into 10 pieces and planted 10 hills. I have dug the potatoes; they weighed 19¾ pounds. That beats anything in the potato line that I know of. G. W. B.

MICH., Unionville, Tuscola Co., July 14.—Farmers have nearly finished haying; the crop has been an average one, and nearly all of it has been secured in fine condition. Wheat is more than an average crop; and oats, corn and potatoes promise a large yield. The apple crop is light; small fruits are in abundance. On the morning of the 10th inst. we were visited by a heavy rain storm, accompanied with hail, but no damage was done.

L. A. R.

MINN., Howard Lake, Wright Co., July 12.—While some farmers were saying that crops were so abundant that the price of many would be so diminished as to be almost valueless in the fall, we were drenched with a rain which threatened to inundate us, and had wind sufficient to lay wheat flat, as well as much of the corn. The latter, it is supposed, will rise again if we should have no more such hard storms as those which have followed each other for more than a week in quick succession. By no means can we predict good times in this region yet, as the weather is very sultry and there are many signs of more pouring showers of rain. One of our late showers was said to have given us frogs, which are hopping about briskly. We have had no hail to speak of, in this vicinity, but some houses were unroofed by the terrific wind a few miles from here. We had hard winds here but no tornado, such as fearfully visited some other parts of our State. Wells are brimming with water and many cellars are filling. Some have to be worked with pumps to be kept empty. We wait patiently for cool breezes with other indications of better weather. We have less small fruit than usual, but a fair crop of apples and probably of grapes. There are very few wild plums, which are nice and sometimes abundant in this State. 13th inst. we have heard more particulars of the storm six miles away. One man had a sugar orchard of about 60 acres entirely destroyed, and the road was so filled with trees, that help to clear it out was solicited from our town, and two wagon loads of men went out, and brought back the report that trees were so thick in the road that they were only able to clear half a mile before night came. Some large apple orchards were nearly all destroyed on the 9th inst. In Meeker and Renville counties great damage was done on the 6th by hail, wind and rain. S. A. M.

IOWA, McGregor, Clayton Co., July 20.—Harvest has commenced in this section. Chinch bugs are injuring the wheat in some fields a good deal, but the wheat in the timber here will be far superior to what it was last year. Corn and potatoes are splendid. I saw a field of corn yesterday that is ahead of anything in this section, and if the ground is not too rich for it to ear well, I think it will be 140 bushels to the acre, or, at any rate, it will produce three times as much as mine to the acre, and I calculate that mine will go 40 bushels.

J. R. J.

NEB., Unadilla, Otoe Co., July 19.—We are having very dry weather, but crops look well, especially corn, which is all laid by, being nearly all in tassel. Wheat is nearly all harvested, but the yield will be small; the chinch bugs damaged about half the crop in this section of the country. Oats are very thin and of poor quality, but we need rain badly.

H. J. P.

N. C., Greensboro, Guilford Co., June 17.—We are having quite a dry season and unusually hot weather; the thermometer has been ranging from 80° to 104° for the last two weeks. All gardens are completely burnt up, past redemption. Irish potatoes are now being dug and the crop is fine and the yield good. Wheat is being thrashed and is a good average crop. As yet corn is not much damaged by the drought, except on uplands that have not been well plowed, but if the drought continues much longer, corn will be cut short. We have had no good rain for six weeks or more in this section. J. V. L.

SO. CAROLINA, Anderson, Anderson Co., July 18.—The wheat crop is fine; but only a small area was sown. Spring oats are a failure, for want of rains; fall-sowing is good. Corn is suffering throughout this county from drought—as we have had but one light rain for the past eight weeks. Cotton is needing rain. Irish potatoes are poor, having been injured by late frosts. Sweet potatoes are backward, but with a good season there is ample time for a good crop. Fruits are a complete failure, owing to drought. The seeds sent me came up badly. S. M. C.

TEXAS, Caldwell, Burleson Co., July 14.—We have had but one good rain this year. It commenced April 22d and rained a flood for eight days. It was then 10 to 14 days before plows could run. Since then we have had only three or four very light showers. There have been good rains, however, in a few isolated spots around us up to nine days ago. Now, a general drought has set in and scarcely anybody will save fodder. Nobody within twenty miles of me will make two-thirds of a crop—some will not make a quarter; I shall make half a crop. Deep plowing saved me. Buyers are anxious to engage corn at $1; but there is none to sell. Oats made 20 to 30 bushels, which is about two-thirds of a crop. Wheat averaged eight bushels per acre—ten would be a good crop. The smooth red May wheat did a little better, although every one says none but bearded sorts will succeed here. The flowers I plowed so deep are all that make much show now. Blunt's corn has received a crucial test and will make something. Everybody wants an ear. Half-a-dozen or more have promised to take the paper if I will give them seed. I am taking notes "an' faith you may print 'em" when the end comes. Some of the corn is beginning to glaze, so the end is not far off. All of the seeds were sent from one to three months too late. The Callicarpa ought to have been sent in October. Our hillsides are covered with it. The beets are nearly all killed by the heat, while the red turnip beets by their side will weigh two pounds. The lettuce has done better. Though some of it is killed, some, I think, will get through—it is seeding now. The Beauty of Hebron, I am satisfied, is a good potato; but it should be planted here in the winter and covered with straw. It was planted too late in a bed of rotten cotton seed—consequently it now lies in the agonies of death without making a single tuber. Of all the flowers I have but one single plant left—a Chater's Hollyhock. I think it will go through. The outside leaves die down, but new ones are waiting to fill their places. I can discover no worm at work; so I suppose its woebegone condition is due to the heat of the sun. We have the promise of the building of the Gulf, Colorado and Sante Fe Railroad at Caldwell by Christmas; but I don't believe very strongly in the fulfillment of the promise. I am going to plant all sorts of good things for sale to the "hands"—if it rains. Irish potatoes, corn, turnips, onions, okra, and many other things do well here, if planted from the 15th of September to October 15th. I am digging a well as fast as the hot weather will allow me. It will be inside my garden, so that I can water my vegetables and flowers. I want to fence in half an acre, so as to include a melon patch, as melons have too many enemies here, more dangerous than any insect pest; and I want so to arrange it as to be able to do as much of the work as possible with the plow. D. H. H.

The Querist.

ANSWERS TO CORRESPONDENTS

Raising Peanuts.

G. W. S., New York City, wishes to raise peanuts, and he asks for information concerning when and how to plant them, the culture of the crop, what profit to expect, etc.

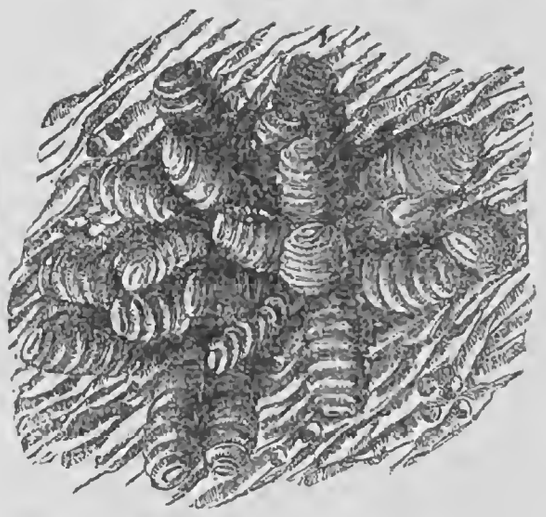
ANS.—The peanut is a tropical plant, and can be *successfully* grown in this country only in the Southern States, though small quantities have been raised in the North. If our correspondent intends to raise this crop in any of the Northern States we would, therefore, advise him to begin on a very small scale. The peanut succeeds best in a sandy loam, manured with 60 to 75 loads of well-rotted manure, with an addition of some 40 to 50 bushels of shell lime, to the acre. This being plowed under, the surface of the land should be thoroughly pulverized and made as level as possible. From the habit of the plant of pushing its pods into the ground, where the nuts develop, it is necessary that the top soil should be mellow. Rows are then made with a marker each way, 30 inches apart, and at each intersection of these, two nuts are then planted, and covered an inch and a half deep with a hoe, the shell first having been cracked or entirely removed. The planting is done in the South before the middle of May; in the North it must be postponed till warm weather sets in, near the end of May or the beginning of June. The crop should be thoroughly cultivated, using the horse cultivator both ways, and the hoe immediately around the plants. Peanuts need a long season, and will continue to grow until killed by the frost. The digging is best done with a five or six-tined digging-fork, but it should be delayed till the first frost has bitten the vines and stopped the growth, which will usually occur in the latter part of September or some time during October, according to the locality. One man then thrusts the fork under the hill and carefully loosens the nuts from the ground, while an assistant pulls the plant up and turns it over to better expose the nuts. In very loose soil it is sufficient to run a plow on each side of the row, when the plants can be pulled up. After two or three days, the plants are stacked. To raise them from the ground, platforms are made of rails, on which the stacks are built and capped with straw to shed the rain. The object of stacking is to dry the nuts, for the weather being so uncertain, it is not prudent to leave them spread on the ground where they would be injured by frosts and discolored by moisture. The stacks are therefore but small, about four feet in diameter and four or five feet high, which dimensions will allow the air to circulate through them freely.

Having remained in the stack till dry—which they will be in two to four weeks, if the weather is favorable—the nuts are ready to pick. If, however, either a cold or wet spell should set in, they should be removed to sheds, where the drying is completed. There are two ways of separating the nuts from the vines—thrashing with a machine and picking by hand. The former method is perhaps to be preferred where large quantities are handled, but the nuts cannot be well-assorted and will not command a high price, whereas hand-picked and well-assorted nuts will command the highest, and sometimes fancy prices. Hand-picking is, however, a slow operation, an expert being unable to pick much over three bushels a day. They are next spread out thinly on a loft and frequently turned till they are perfectly dry, when they are cleaned, generally with a fanning mill, and marketed. As the price depends a good deal on their bright appearance, the pods are sometimes placed in a revolving cylinder, where they are polished by mutual attrition; and the very white pods are made so by being bleached with the fumes of sulphur. The vines are considered, when properly harvested, before they have had too much frost, equal in value to clover hay for cattle, but for horses they are too dusty. The yield ranges all the way from 20 to 100 bushels per acre and the price from $1 to $2.50 per bushel. The crop is considered more valuable than cotton or tobacco. Two varieties are recognized—the Virginia, which is the larger, and the Carolina or African. Large quantities of peanuts are eaten, but their chief use is for making oil, the seeds containing from 42 to 50 per cent. of a nearly colorless, bland, fixed oil, resembling olive oil and used for similar purposes. The principal consumption of this oil is in soap making. Vast quantities of peanuts are, also, grown on the west coast of Africa.

Bots in Horses.

A Subscriber—address mislaid, asks whether there are such things as bots in horses; and if so what are they and how to get rid of them.

ANS.—Of course there are such things as bots in horses, and, for that matter, in sheep too. The former are the larvæ of the œstrus equi, a species of gad-fly, and the latter the larvæ of the œstrus ovis, another species of the same genus. The accompanying cuts represent the



common œstrus equi and a cluster of bots adhering to a horse's stomach. The fly comes out from the pupa state about the middle or latter part of summer, the time varying according to the weather. When the eggs are mature the female soon selects a fit place for depositing them on the hairs of the nearest horse turned out to grass. When about to deposit the egg she hovers in an upright position then darts upon the horse, instantly fixing the egg on the hair by means of a glutinous secretion. This

feat she repeats with marvelous rapidity until often 400 or 500 eggs are placed on one horse. Instinct tells her to deposit them on those parts of the animal within easy reach of the tongue, such as the inside of the forelegs, the back of the shoulder and the sides. In four or five days' time they become ripe so that the slightest application of warmth or moisture is enough to instantly bring forth the larvæ. If at this time the tongue of the horse touches an egg, a small active worm issues from the egg adheres to the tongue and is carried down

the gullet to the stomach, to the white, insensible lining of which it at once attaches itself by means of a couple of hooks, one at each side of its mouth. Sometimes in licking or biting itself or another animal, the horse detaches some of the eggs before they are mature and in that case the larvæ are developed in the stomach. The bots pass the autumn, winter and spring as represented in the cut, and attain their full size about the beginning or middle of summer, when they let go their hold and are carried out with the dung. On reaching the outer air, the bot buries itself in the ground and becomes a crysalis and in a short time emerges as a fly ready ere long, if a female, to deposit eggs from which other bots are similarly evolved. A ragged coat and an unthrifty appearance are often outward symptoms of the presence of bots, but more frequently their presence is not suspected until they appear at the anus. They vary in number in the stomach from half a dozen to as many hundreds, and sometimes are so numerous that they block up the orifice from the stomach to the intestines. With regard to the amount of injury they do, opinions widely vary; but of late the best veterinarians think that they do little or no damage. Frequently the symptoms of other ailments are attributed to their presence, but if the proper remedies for these affections are applied, the bots are no longer troublesome. Eggs are sometimes deposited on horses in the stable or the yard, but as they can be readily detected on all animals except those of a chestnut color, they can be easily removed. Medicine cannot remove bots from the horses' stomach, because they adhere to parts of it where medicine seldom reaches them, and, moreover, their mouths are too deeply buried in the mucus for any medicine that can safely be administered, to affect them, and, besides, they use food so very slowly that the medicine is carried away before any appreciable quantity of it is absorbed by them. Horses, however, are frequently injured by the medicines that are ignorantly given to remove the bots. This will be easily understood when it is stated that live bots have been immersed in spirits of turpentine, alcohol, nitric, muriatic and even sulphuric acids, without having been killed by them.

Dysentery and Red-Water in Oxen.

C. E. S., East Sound, San Juan Co., Wash. Ter., last spring had an ox that had wintered very badly and was poor. He fed him lightly on good hay, worked him lightly, and sometimes turned him into a good pasture. One day he turned him into a pasture richer than usual, where there was a good growth of tall timothy. Afterward he was fed on hay two nights and a day without showing any signs of sickness. The animal was then turned out, as the out-range was good. In a few days he was found to be sick. He had pains in the bowels, and would drink often. From the bowels came slime mixed slightly with blood, and some wind. He would eat little or nothing, and died in two weeks' time. The slime became nearly pure blood before he died. During his sickness he passed nothing but slime and blood. Our friend asks whether he died of over-feeding, or what ailed him. 2. Work oxen are troubled there with bloody urine, and die in the course of a couple of years after its appearance; and he asks the cause, whether it is preventable, and a remedy for it.

ANS.—1. The ox mentioned evidently had dysentery, ending in bloody flux. This often occurs in animals poorly wintered, when turned on rich pasture in spring. The sudden change from dry food to laxative grass is very trying to most cattle, and the evil was probably increased by the over-exertion of the ox in his thin condition. The best safeguard against this would have been to have fed the ox some laxative food, such as oatmeal, or a gill of linseed oil mixed with the food every day, or a small feed of boiled oats or barley daily for a few days before turning out to pasture; or, if none of these is at hand, turn out to grass only one or two hours per day and feed hay. After the disease shows itself, perhaps the best offhand treatment is to rub the belly actively and apply mustard—or rub with warm water and then place a woolen blanket under the belly, bring up over the back, and pour warm or cold water, according to the season, between the blanket and the body, letting it remain for several hours. Give a steep of oak bark, half an ounce of sulphate of iron (copperas) dissolved in its food. A small dose of turpentine (a tablespoonful), or a half teaspoonful of carbolic acid, in a pint of water, will assist in healing the mucous membrane. 2. The last disease mentioned may properly be called Red-water. This disease often afflicts cattle in a new region. Owing to the rankness of growth the water is charged with vegetable matter, exciting the digestive organs and liver. It disappears as the country becomes cultivated. The laxative food mentioned above is a good preventive and assistant in treating the disease. In the commencement of the disease an active purgative is best, unless it is accompanied with colic and tenderness of the abdomen, when only mild cathartics—such as olive oil, boiled linseed or nse oil—should be given. Boiled grain, bran mashes and boiled hay should be given as food whilst under treatment. Cattle that are affected with this local disease would probably recover if sent off, their places being supplied with others unaffected.

The Vanilla Bean.

R. W. H., Berkley, Cal., asks if we have any book on the cultivation of the Vanilla Bean, as practiced in the South Sea Islands.

ANS.—We have not, nor do we know of any work devoted specially to that subject. Vanilla is the botanical name of a genus of orchids, and also the popular name of the fruit or pod of the plant. All the species—of which there are but a few—are climbing plants (an unusual habit for orchids), their slender stems emitting aerial roots by means of which they ramble among the branches of trees. The fruit, when fresh, is about the size of the little finger, somewhat three-cornered, fleshy, firm, smooth and plump. The most important species is Vanilla planifolia, a native of the warmer parts of Mexico, and introduced into Central and South America and various parts of the East Indies and South Sea Islands by cultivators. It requires a warm, moist atmosphere, and can be cultivated successfully only in localities presenting these conditions. It is propagated by tying a shoot, about three feet long, to the base of a tree. The plant comes into bearing in about three years, and will continue productive for thirty or forty years. When quite ripe, the pods split open lengthwise into two unequal valves, and they are therefore gathered before complete maturity. The drying of the pods is a long process, consisting of alternate wrapping in woolen cloths and heating, and exposing to heat uncovered—a manipulation which develops their peculiar odor, and gives them a dark-brownish color; they are also oiled in course of curing. Like most other orchids, the flowers of Vanilla depend upon insects for aid in fertilization. Although for a long time the plants flourished vigorously and flowered profusely in the East Indies, they bore no fruit, the proper kind of insect not being present, but fertilization there is now performed artificially. As found in the store, the vanilla pods, or beans, are like fleshy, flexible sticks, from three to eight inches long, from three-tenths to four-tenths of an inch wide, flattened, hooked and narrow at the stalk end. Within are found innumerable, minute, shining, black seeds embedded in an aromatic, viscid pulp. The odor and flavor of Vanilla are not due to a volatile oil; but to a crystallizable principle, vanilline, of which about one per cent. is contained in the pods. It can also be produced artificially from coniferine found in the sap of Pines. In flavoring chocolate it is ground up with the seeds, but for candies, cooking and ICE CREAM, it is most frequently employed in the form of an extract. This is prepared by cutting the pods into small pieces, thoroughly triturating, or pulverizing them with sugar, then digesting, or softening them with alcohol, and afterward percolating, or straining them. Much of the cheaper sort is adulterated with Tonqua Beans. Our chief supply comes from Vera Cruz and Tampico.

Hay Fever.

B. P., Washington Co., Pa., asks whether there is any remedy for hay fever.

ANS.—This affection was first described early in 1819, and although it has been studied pretty closely since, yet little has been learnt as to its cause or cure. As to the former, there is little doubt that it is due to vegetable emanations, and observations show that freshly-mown hay produces it in some people. It is probable, however, that different persons are similarly affected by different kinds of vegetation diffused in the atmosphere. Its local symptoms are subcutaneous inflammation of the nostrils and of the bronchial mucous membrane, together with irritability of the eyes, and, in some cases, bronchial spasm or asthma. Dr. Morrill Wyman, who has elaborately studied the ailment, says there are two forms of the disease affecting persons of peculiar idiosyncracy. The first, often called the rose cold, or June cold, commences in May or the early part of June and continues to July. The other, called, also, autumnal catarrh, begins in the third or fourth week of August and ends in September or October. The disease is not found in the Southern States or the north of Canada, and in the rest of the country affects only people of a certain temperament. It has been found that persons suffering from it find complete relief after the first 12 to 24 hours of a sea voyage. Relief is also obtained where there is little or no vegetation, as well as by going to certain parts of the White Mountains; to Mount Mansfield, in Vermont; to the Adirondack Mountains, or generally to any point 800 feet above the sea. Those who cannot avail themselves of these means of relief, may find help or exemption by various changes of residence, to be determined in each case by individual experience, inasmuch as the special agencies are unknown. The treatment of the affection, where removal is impossible outside the region in which the cause exists, must consist of palliative or soothing measures. Iodide of potassium and the salts of bromine, arsenic, and strychnine, have been found useful; but, of course, these should be used only according to medical advice.

Eureka Wheat.

J. A. B., Annville, Lebanon Co., Pa., says that an agent claiming to represent "The New York Nursery Company" is traveling through that section with what he claims to be a new variety of wheat, called the Eureka. It is to yield 50 to 60 bushels per acre, and he asks only $5 per bushel for the seed, and he generously offers to pay the buyer $3 per bushel for all his surplus wheat for the next two years. Our friend asks whether we think it "healthy" for our readers to invest in the Eureka.

ANS.—New York is so large a place that a small concern that might wish to shrink from local notice could easily hide in an attic, so as to escape a very diligent search; especially when, as in the present case, no special address is given. We have therefore been unable to learn anything about "The New York Nursery Company," and we certainly think it very "unhealthy" for any of our friends to have anything to do with folks who make such palpably absurd promises as does the untindable company's agent.

Willful Beans.

J. D. T., no address, says that his great trouble is to make his Lima beans cling to the poles. He has tied them up, but with no good results; they perversely prefer to run all over the ground, and they have nice cedar poles, too.

ANS.—These beans seem to be some uncommonly willful and creeping characters, without gratitude for their nice poles, and with a singular lack of ambition to rise in the world. So much do they differ from their brethren, that we wonder if they are beans at all; this question we trust, however, that our correspondent can settle for himself. Were they twisted around the poles in the right direction; against the sun, that is, from the south by the east, north and west to the south again? If not, coax them that way.

Clarifying Sorghum Juice.

B. C. McV., Pomona, Kan., wants to know how to clarify sorghum juice.

ANS.—On heating the juice to a temperature of 170 or 180 degrees F., a large quantity of the albumen will coagulate and rise to the top, and must be removed by skimming. But still another portion is held in solution by the free acid in the juice. In order to coagulate this, the acid is neutralized by adding milk of lime, from six to seven pints to every 100 gallons of juice. This being thoroughly stirred in, the remaining albumen coagulates, and is skimmed off. It requires experience to do this nicely and at the right moment, and a beginner in sugar-making from sorghum is not likely to meet with the best results at the first trial. Professor F. L. Stewart has published a book on the subject, which will give more detailed information. It can be obtained through book offices.

Miscellaneous.

S. C., Oriskany, N. Y., wants to get a hogshead to hold water and asks, 1, which is the better—pine or oak. An application of tar to the outside of a pine vessel he thinks might render it equal to any other. 3. He also wants to know what part of Iowa is the best for farming; what is the price of land there per acre; and how many acres of cheap land can be bought for $500; what is the price of improved land per acre, and to the growth of what crops is the climate in the southern part of the State best adapted. 3. His neighbor's potatoes are scabby, and he asks the cause; muck was put on the ground three years ago.

ANS.—1. An oak hogshead would certainly be the strongest and most durable; but a good coating of tar applied whenever needed, to a good pitch-pine hogshead, will render it a satisfactory water holder. If the tar is applied to the inside as well as to the outside, all the better. After a short time the water is very little affected by it, and then tar water is healthful. Moreover, the lining of tar is made more durable by the pressure of the water, it is less affected by the sun or accidental contact, and does not soil clothing, etc. 3. To return trustworthy answers to these queries would require a more minute and extensive acquaintance with the various parts of that fine State than we unfortunately possess, although we have traveled pretty extensively through it. Much information on the matter can be gathered from our "Everywhere" department, and we shall be pleased to publish reliable answers from any inhabitant of the State able to give the information. 3. Various causes produce scabs on potatoes. Fresh stable manure and an undrained soil are among the most notable.

R. T. M., Jackson, Mich., asks: 1. How can he obtain full reports of the addresses at the late Cleveland Convention of Pomologists; 2. the price and publishers' address of the Herald of Health, lately "noticed" in the RURAL.

ANS.—We noticed among our "exchanges" that the Cleveland Leader or Herald contained pretty full reports of the proceedings of the Convention in the issues of June 19, 20 and 21. As no authorized report has yet been published, probably the best way to obtain what is desired would be to write to the publishers of one of the above papers for the numbers containing the reports. 2. Holbrook & Co., Laight street, New York. $1. (Monthly magazine.)

J. M., Lyn, Ont., has 25 acres of muck ground that used to be a beaver meadow; lately, however, a large ditch was run through it and drained it dry. Onions and melons have been planted on it and have thriven remarkably well, and our friend inquires what kind of crop planted on it would be likely to turn out most profitable.

ANS.—We cannot answer the question in a trustworthy manner. Almost any crop would grow on such land, and our friend has to consider which is likely to sell at the highest price in his market. Of this he could judge better than we.

J. McC., New York City, asks where are onions raised in New York State and Connecticut.

ANS.—Onions are raised and cultivated in New York State and Connecticut as commonly as turnips. The trouble would be to mention a section where they are not raised.

W. A., Chapel Hill, N. C., asks whether the Green Rose is in the RURAL collection, and says that it has no charm, and is only a *lusus naturæ*.

ANS.—We have never thought it worth having.

M. W., Poquonock Bridge, Conn., sent us a plant for name; but it could not be determined from the specimen then sent. We requested seeds, and the seeds were sent and planted. One plant is now in bloom, and we find it to be Jerusalem Oak or Feather Geranium. Its botanical name is Chenopodium Botrys.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 82.—JULY 18, 1879.

Fertilizer Analyses.

298. Superphosphate of Lime. Sampled by M. S. Baldwin, Naugatuck, June 23. From stock purchased of H. J. Baker & Bro., New York.

299. Pure Ground Bone.

302. Salts of Potash. 299 and 302, sampled by S. B. Wakeman, Saugatuck. From H. J. Baker & Bro., New York.

	298	299	302
Nitrogen		3.91	
Sol. Phos. Acid	13.69		
Rev. Phos. Acid	1.10	21.63	
Ins. Phos. Acid	1.58		
Potash			32.98
Est. value per ton	$38.42	$40.52	$49.47
Cost per ton	$30.00	33.00*	51.25

Cost of Sol. Phos. Acid in 298, 11 cents per lb.

302 was sampled April 25. The specimen was quite dry when first taken, but standing in an imperfectly closed can, gathered moisture from the air and became quite wet.

This sample is mainly a carbonate of potash containing some sulphate, a little muriate and also a little prussiate.

Carbonate of potash is quite corrosive and would be likely to injure vegetation if incautiously used. It is easily distinguished from sulphate and muriate by its effervescence when mixed with vinegar.

The above valuation is based on the Station estimate for high grade sulphate, 7½ cents per pou What allowance is to be made for the moisture which the sample has gained is of course uncertain.

It is quite important that all samples be secured in air-tight vessels and also that they be forwarded to the Station immediately after they are taken.

All kinds of potash salts gain moisture rapidly when exposed to the air in damp weather.

FORRESTER'S SPECIAL FERTILIZERS.

The following samples were sampled and forwarded to the Station by S. B. Wakeman of Saugatuck, and were manufactured by H. J. Baker & Bro., New York city.

300. Forrester's Corn Fertilizer.

301. Forrester's Onion Fertilizer.

303. Forrester's Turnip Fertilizer.

304. Forrester's Potato Fertilizer.

	300	301	303	304
Nitrogen as Am'nia	5.52	5.45	6.73	3.89
Organic nitrogen		1.91	1.18	.88

78 Duane Street, New York City.

SATURDAY, AUG. 2, 1879.

CASH vs. CREDIT.

"THE man who builds and wants wherewith to pay,
Erects a house from which to run away."

So says the poet, and the experience of many a business man, as well as many a farmer has indorsed this statement. But it is more especially applicable to farmers. Merchants, from the very nature of their business, must trust and be trusted in return. To them a credit system is indispensable. When a demand for a certain article is created on short notice, the tradesman must be able to supply his customers, and to do so it often becomes necessary for him to go in debt for the goods; but if he has foresight, buys with judgment and understands his business, he will in a short time have disposed of the goods at a profit and be ready to pay off his debt. Not so in the case of the farmer. In his business there are no sudden hits to be made. For him to go in debt, in ninety-nine cases in a hundred hampers his prosperity instead of promoting it. His income consists in what he derives from the sale of his products, his grain, fruit, hay, potatoes, stock and dairy produce. These are slowly produced. Many disasters beyond his control, are liable to interfere with his plans, of which the present condition of affairs in England furnishes a striking example, and when quick and sure returns cannot be had it is, to say the least, a hazardous policy to go in debt.

What we desire to impress upon our readers is to keep clear of debts. Of all rash acts, we believe that to borrow money even for a permanent improvement, unless such improvement is an absolute necessity, is most likely to be repented of. A new house may afford much cherished comfort, but comfort bought with borrowed money is borrowed comfort, and must in the end, be dearly paid for. It is not enough that a certain improvement will pay the interest on the money invested. If it pays only the interest, what will become of the principal? The tendency of things is to wear out, and diminish in value. The drains put into a field, or a new barn, cannot last forever, and if improvements that return only the interest, are made on borrowed capital, the condition stated at the outset will eventually ensue: the owner will be forced to leave his home in the hands of his creditor. Again, the returns from the farm are ordinarily so slow that before a borrowed capital can be paid off, the interest upon it may often amount to once or even twice the principal, and the improvement becomes a costly undertaking. We do not mean to say that no improvements should be made on the farm; without improvements agriculture would degenerate. What we mean is that they should not be made with capital borrowed on loose and superficial calculations. But few men have the sagacity to foresee and judge correctly of the real value of such investments, and without such foresight it becomes but little better than a game of chance in which no man should stake his independence.

There is another class of debts in which some families thoughtlessly involve themselves. It is those little items from the grocery, the hardware store, the lumber yard, the shoemaker, etc., which, though seemingly innocent and insignificant in themselves, soon swell in the aggregate into respectable bills that will be doubly hard to pay after the goods have all been consumed. No one should buy on credit if he has the cash wherewith to pay, though it be necessary to disturb a bank account, and if the money is not at immediate command, it is better to contrive to do without a thing in some way, than to buy it on credit. To live within one's means is an important lesson to learn. No man is rich whose expenditures exceed his income, though he dabbles in millions, while the one who can save ten cents a day is on the road to fortune.

Young men who are fettered by poverty and who wish for the use of a few hundred dollars wherewith to start in business, to finish a course of study, to buy a piece of land, or for any purpose, should hesitate twice before they give up their independence, and voluntarily fling themselves into a creditor's arms. Wait, work and pay as you go. You may attain your object more slowly, but it will be reached just as surely and with infinitely greater satisfaction. If your good name is all you can offer as security, a rate of interest will be required which, under other circumstances, would with propriety be termed exorbitant and usurious.

"Hope springs eternal in the human breast," and to the young man who views life through rosy glasses, it seems an easy matter to repay a few hundred dollars; but when the money is spent, and the principal is swelling with the accumulating interest, the mistake is too late discovered.

TEACH AND LEARN.

ONE man cannot thoroughly, safely, and wisely conduct many experiments at the same time. Hence, it is very desirable for neighboring farmers to help one another in this respect. So of all classes engaged in productive pursuits. Ten men can, in one year, try a number of theories that one man could not put to the test in less than ten years. If one makes an experiment that proves unprofitable, it is his duty to let his friends know it, that they may not suffer by repeating it. If one possesses special knowledge about varieties of articles of produce, peculiarities of culture, methods of preserving or utilizing what is raised, or anything else of importance to success and prosperity, he ought to be kind enough to inform his neighbors, at least, so that they may be wiser and more successful. In a certain community the farming was unimproved, and, hence, unprofitable. A progressive man of intelligence and skill moved in from a distant State, introduced more advanced ideas, and rapidly converted the poor land into a fertile, profitable farm. His neighbors were kindly enlightened, adopted his wise example, and soon brought up the whole community to much greater prosperity. Of course, the man who taught and those who learned are much happier. Let it be known that selfish monopoly of useful information is suicidal as well as ignoble and uncharitable; and that few men are to be pitied more than those who refuse to learn by the experience of others.

To further these suggestions, it is recommended that farmers, gardeners, fruit culturists, etc., visit one another more frequently, talk together more freely, publish their experiments more carefully, and, in every legitimate way, try to teach more and learn more.

What May Yet be Done.—Where the drought has prevailed and the regular crops have been cut short, everyone ought to do the best possible in the effort to supplement the insufficient product. It is not yet too late to profit by the later rains. Corn planted in drill will attain sufficient size to make good forage before frost, at least in many States. Peas sown now will make large vines, which are very strengthening feed. Millet may yield one good cutting. The last crop of hay should be carefully saved—even the coarsest kinds, and all that can be found in spots along the ditches and streams. Now is the time to sow turnips. A good rule is to sow at different times, so as to have a succession of chances. Certainly those who are threatened with scarcity for their stock should aim at a much larger production this year. Another help may be found in putting in a larger area in rye, so as to have grazing in winter; and, in some protected places, with a view of early green feeding in spring. That which is set apart for spring mowing should not be grazed at all. Where the forage crop is limited, the hardest season will be at the opening of the spring, before other green crops are sufficiently advanced. Hence, the wisdom of sowing a field of rye.

Prompt Payment.—It is very desirable that there should be entirely pleasant feelings between the employer and employed. While many things tend to prevent this, notwithstanding the best efforts of the employer, it is true that there is often much unnecessary dissatisfaction in the minds of hired laborers because their wages are not promptly paid. It is unnecessary, because it could be easily prevented. Sometimes simple forgetfulness, sometimes not altogether excusable neglect, sometimes great pressure of other business, sometimes the charms of pleasure or the attraction of good company,—causes delay in paying wages. No matter what the cause, it does not supply the wants of the poor man or his family, or prevent his having a feeling of being wronged. A cheerful payment of sheer dues has often put a smile on the face, elasticity in the step, energy in the arm, and more and better work in every hour.

Water for Stock.—In the dry season which is proving so severe in many parts of our country, all who have stock of any kind should be more than usually careful about the supply of water. The large pastures and the broad common may be without water before such a thing is suspected. In many instances the water that remains is stagnant, and unfit to be used by any animals that we prize. Another fault with some persons is in permitting the trough or other vessel from which animals are watered, to stand too long without being emptied and properly cleaned.

Blunt's Prolific.—We have received several letters of which the following is a fair specimen:

ILL., Evanston, Cook Co., July 22.—What is the matter with the corn you sent me—Blunt's White Prolific—it is from 10 to 11 feet high, and not a sign of an ear on it yet and no tassels. How tall will it have to grow before it tassels out and has ears on it? Is the ground too rich or is it the style of the corn?

ANS.—We cannot answer the questions, never having cultivated the corn before this season. Perhaps Prof. Blunt can. We have seen several plots and the same queries have suggested themselves to us.

BREVITIES.

MARSHALL P. WILDER'S health improves.

THERE is probably no other crop that shows more emphatically the benefit of manures than oats.

ONIONS chopped up fine are good for chickens. Give once a week. The green leaves of mustard plants answer both for pepper and green food.

WE said a year ago and over—and now we repeat it in corroboration of our own words—that the *Cuthbert* is the coming red Raspberry. We believe this variety, either for the amateur or market gardener, to be the best in cultivation. The reader is requested to bear our words in mind.

MR. J. J. THOMAS doubts the propriety of cutting out the cane of Raspberries just after they have borne a crop of berries, so as to give the new canes a full chance to develop themselves, because the removal of a large amount of green foliage always checks or injures the plant or its roots.

IT PAYS well to go over the ruta-bagas and mangel rows at this season and thin them out to proper distances. The leaves of the latter make excellent greens, and the tender roots are relished by stock. It is a fact that three mangels growing at suitable distances, will make heavier roots than six would if crowded together in the same space.

MR. CHAMBERLAIN writes us from Hudson, O., as follows: "Fultz and Clawson. Ground not under-drained. Fultz, 20 bus. per acre; Clawson, side by side with equal chance, 30 bus. per acre. Best three acres of Clawson last year, on under-drained land, 61 bus. per acre; best 10 acres last year, 46½ bus. per acre." Such facts are instructive.

GLADIOLI are now in fine bloom. Unless the ground is moist, the midday sun scalds the racemes and causes an early decay of the beautiful flowers. Many, indeed most, of the finer varieties do not form fruit. They may sometimes be induced to do so, however, by pollenating the stigmas (heads) of the pistils. Seeds of the Gladiolus vegetate freely and produce blooming bulbs the third year. We cannot too strongly urge our readers to try their cultivation.

BLOOMING in woods and meadows over many parts of the country may now be found that fine shrub Spiræa salicifolia. It is one of the best of the Spiræas, though many country people in their rides or walks pass it by as a wild flower, without ever thinking that it is as worthy a place in their gardens as any of the Spiræas seen and admired in nursery rows. It has a clean, smooth, reddish, brittle stem, light green leaves of an ovate or obovate form. The Flowers are borne in compound panicles. They are white, sometimes tinted with a blush of pink. It blooms from mid-July to mid-August.

AS THE fair season approaches, we need scarcely remind our readers that it is a good plan to take with them a note-book and pencil, that they may jot down memoranda which it may be desirable to refer to afterward. We would like to have them, also, take notes as to the moral effect of horse-racing; as to whether that is or is not the *life* of the agricultural fair. It might be well, also, to note—should the earth need rain—to what extent the ladies and gentlemen who attend are inconvenienced by the clouds of dust that envelop them from the race-course.

OUR fine engravings of Lord Exeter's "Telemachus 9th;" Lord Rathdonnell's "Anchor;" Mr. Taylor's Hereford bull "Thoughtful"—which, by the way, is an extremely appropriate name, as will be seen by a glance at the portrait—were originally produced in the columns of that enterprising English journal the Agricultural Gazette. As we were not at this great show ourselves, the best we can do is to give such portraits and items as may be copied from the best London journals, while we glean the best information from our own correspondents and the most trusted foreign accounts.

CORRECTION.—In a recent issue, in answer to a correspondent, we stated that the riding saw made by the Farmers' M'f'g. Co. of Cincinnati, was the same implement as that formerly made by Mr. Giles. We are in receipt of a letter from the company to the effect that the machine is not the same, and that suits are now pending against Giles for infringement of patent.

If, then, it is merely a case of infringement, the saws cannot differ materially, and our correspondent will be safe in assuming that the saw made by the Farmers' M'f'g Co. is a good saw. We are requested to say that Mr. Giles has at no time been connected with the above-named company. We do so with pleasure.

OUR articles, "Cash vs. Credit," are bringing us many letters of thanks and appreciation. We are pleased to see that a number of our Western contemporaries are taking up this really important question. If we could, we would prohibit the entire credit system by law. No doubt credit is good in *some* cases. So is strong drink. Our readers may have heard of the man that was saved by drinking whisky. The drink made him too late for the steamer, which burst its boiler and killed all on board. Nevertheless, we would prohibit the sale of all intoxicating liquors, if this were possible.

WE have few implements at the Rural Farm that we prize more than the disc harrow and the roller. One of the secrets of success in the flower garden is that the ground is frequently and well stirred. The available nutriment of the soil is thus brought within the reach of the roots of the plants and the pulverized surface is in more ways than one favorable to the well-being of vegetation. We have no doubt that in many cultivated fields, the very same lumps of earth remain from year to year as useless as stones, though not so hard. The use of a disc harrow and a two-horse roller upon many fields would prove as valuable for a year or so at least as a liberal dressing of manure.

THOSE who cultivate hilly or rolling lands in corn, ought to be sure to have the rows wide apart. If there should be much rain, the ground is well drained and the yield will be good any way. But if the season should be dry, the narrower the rows the more the corn will suffer; and the wider the rows, in reason, the less the row about the stalk will be exhausted by the drainage of the middle furrow. In a field observed this summer, a short row that was very wide, was very slightly affected by the dry weather, while the over-drained, narrow rows around it were much more seriously injured.

MANY of the embarrassing and dangerous accidents that occur in riding and driving might be prevented by a little attention. The rider should know for himself that every part of the bridle and saddle is in reliable condition. The driver should know if the harness and vehicle may safely be trusted. Considering the carelessness of multitudes, it is wonderful that there are not vastly more accidents in travel. It is time wisely spent when one walks around and cautiously inspects the several things upon which his limbs and life will depend. Those who keep trappings and vehicles should examine them patiently, from time to time, when not in use, and not wait till the moment of starting to work or to travel.

"THE Japanese Maples," says the London Garden, "in Messrs. Veitch's collection, deservedly attracted a good deal of attention. Such dainty little trees, with elegant feathery growth, are sure to be sought for the greenhouse and conservatory, even if they do not prove quite hardy in all parts of the country." They are hardy here, why not in the vicinity of London? If we need a Latin nomenclature so that any plant may be known by its botanical name in any country, we certainly need some other word besides "hardy" by which to express a plant's power of enduring drought, wet, heat, cold, and frequent alternations of heat and cold. It seems to us that the meaning of the word *hardy* ought to be accepted as simply relating to a plant's power of enduring cold.

IT has seemed to us that the word "catch," as applied to clover seed germination, is unfortunate, because misleading, since it justifies the impression that a good deal rests upon *chance*. It may be observed that if the seed is good, and properly sown, there is no chance about the "catch" if the soil is in a proper condition to insure it. If the soil is too dry, it may germinate, but the young plants may dry up and die for want of moisture. If the soil is too poor, they may germinate all the same but starve to death. It may be safely acted upon that if the soil is mellow and rich, clover sown either in fall or spring will prove a "good catch," the same as any other seeds, and that when it fails, the cause, except it may be excessively dry weather, is within the control of the farmer.

THE MESSRS. WILLIAMS send us from Montclair a box of Doyenné d' Eté, and Madeleine pears. Both are small. The first has a refreshing, sweet, juicy flesh, a small core and small white seeds. The tree bears while very young. Madeleine is rather more acid, but not the less of a most delicate, agreeable flavor. These early pears ripen just at a time when fruit is needed. Raspberries, currants and gooseberries are past—really good peaches are not yet in the market. Nothing but blackberries remains. They have much of the high flavor of our best later varieties and they may be eaten with all the relish that one enjoys while eating the first good fruits of the season. D' Eté thrives in N. H.—N. Y.—Delaware.—Md.—Tenn.—S. C.—Ga.—Ala. and even Texas. Madeleine does fairly well in a number of states, but we have no trustworthy notes as to where it thrives best.

POT-GROWN STRAWBERRIES may be set now and until October 1st for this climate. The plants may be ordered at *any* time, and then cared for the same as any other potted plants until sufficient rains make it desirable to set them in their permanent beds. If these Strawberries have been carefully raised by the nurseryman and carefully packed, they may be trusted to produce nearly a full crop next summer. Instead, therefore, of waiting another year for such promising new sorts as Sharpless, Cumberland Triumph, Prouty's Seedling, Marvin's Strawberry, etc., etc., to fruit abundantly, a few potted plants may be purchased at a small cost, and the family may the first season determine their value for their soil and location. It may be desirable to place the baskets or pots (soil and all) in water for a few minutes previous to final planting. Disturb the roots and soil about them as little as possible.

Literary Miscellany.

CLOUD LESSONS.

We watched the clouds at close of day:
A few were white as driven snow,
And all the rest were black or gray.

He said: "Some men have souls as clean
As you white clouds; but well I know
Such men are few and far between."

Asked little Alice, moving near:
"Why are those clouds as dark as lead
So near the hill-top, grandpa dear?"

"And why are those that look like heaven
So far above the rest?" He said:
"White clouds and men are nearest Heaven."

He rose and leaned upon his staff,
An aged man with pleasant eye,
And mellow cadence in his laugh.

The sunshine lingered overhead
Among the moving shapes; the sky
Was light, the earth grew dark. He said:

"These ever-changing, moving clouds
Well represent the men we know,
And faithful pictures of the crowds

"That ever change, but never rest,
Where many come and many go."
And then he smiled as if in jest.

But as the sun sank low and lower
The white clouds shone with many a ray;
The rest seemed darker than before.

He said: "This picture must decide
The fate of men; at close of day
Only the pure are glorified."

[*New York Observer.*

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER III.

Miss Carew was alone in her small sitting-room, Nelson had gone with the landlady's children to a farm house outside the town, and was to come back in a spring-cart with a basket of eggs and flowers for Olive. There was nothing to interrupt her thoughts as she sat and sewed in the bow-window, and the shadows from the trees outside fell across her face. It was graver just then than her lover would have liked to see it; it was too patient to be the face of a happy woman. To-day Dr. Yorke had been urging her to throw up her engagement at the theatre and marry him at once, but she shrank with a curious dread from granting this request; she clung to the few weeks that remained to her of the happy, careless stage-life, the worst trouble of which had been the difficulty of making dresses out of nothing, or of struggling through the idle summer months with two mouths to fill.

"If it were not for Nelson!" she thought. But then was it not for Nelson's sake alone that she had consented to forfeit her self-respect, and marry this sober, kind-hearted country Doctor whom she did not love?

And for Nelson's sake she would complete the sacrifice, right or wrong—would enter a family whose women looked scornfully at her, would lay aside her own tastes and desires, and settle down to the prosy life of this small town, and spend her days in a mild hypocrisy, her best hope being that in time she might learn to be contented. But Nelson, her darling, should be happy. Under the Doctor's constant care, and with the unwonted ease and comfort of a settled home, her boy's strength would increase. He would grow up tall and robust and high-spirited, and have a good education, and come home in the holidays so big and sunburnt and hardy, so full of his exploits in playground and in class, that it would atone to her for many dull and lonely and regretful days that she would have to live through meanwhile.

As Olive was dreaming all this, Mrs. Allen, her kind little landlady, opened the door and breathlessly announced "Two ladies—in a carriage!" and Olive knew that she was about to make the acquaintance of her lover's womankind—knew it with a weary sinking at her heart which would have increased tenfold had she known how fierce a battle had been raging at the tranquil house in George Street, on her account, for the past two days.

Miss Yorke, finding that the announcement of her intention to go and bury her grief down in the wolds of Lincolnshire met with a calm acquiescence from her ungrateful nephew, had been compelled to relent with outward amiability, but with rage in her heart, and had consented to call on Miss Carew, and to receive her with the courtesy due to the future Mrs. Yorke. But of all this Olive was happily ignorant, and letting her sewing fall, she advanced to meet her visitors—Miss Yorke tall, erect, square, in creaking boots and thick brown silk; Gertrude, breathing a little heavily from the stairs and in tight corset, dressed in the height of the Woolchester mode, and positively rustling with expensiveness.

Miss Carew spoke her pleasant words of greeting to them both, and they eyed her beauty and her shabby gown with eager unfriendly glances as, perfectly unembarrassed, she turned a pile of music off one chair, and a yellow silk dress that wanted mending off another, so as to find seats for them. Dr. Yorke had been prevented at the last moment from accompanying his aunt, and in consequence the conversation languished in his absence.

Olive tried bravely "to make talk," but she had so little in common with her visitors. Gertrude employed herself in taking uneasy note of the coquettish simplicity of Miss Carew's well-worn gown, and resolved to copy it in a better material. Miss Yorke eyed the actress sourly, as Olive sat at the open window, her wonderful fairness and lovely bright hair shining in the yellow afternoon light, that streamed in through the budding branches of the trees, and lit up every nook and corner of the room, Nelson's piano and flowers, the stage-dress on the floor, the litter of "parts," and books and manuscripts on the table. Miss Yorke felt, as she looked at them, that she would like to sort them all in square piles, to lay the books at even distances round the table, and to close the lid of the piano. What would she have done with the flowers, the innocent pansies and violets and hyacinths, if she had known that Robert had paid ten shillings for them that very morning?

"Don't you find these rooms very confined?" she asked in her blunt fashion.

"I suppose they are," responded Olive, smiling. "But I live in so many baronial halls and palatial mansions that it is quite a pleasure to me to find myself within these narrow walls again."

"Oh, indeed!" Miss Yorke had not an idea of what the girl meant, and began to fancy terrible things.

"Besides, you can't imagine what splendid company I have received here."

"Company?" Miss Elizabeth's face grew grimmer and grimmer. Gertrude colored.

"Yes. Colonel Esmond has done me the honor to call several times; Major Dobbin too; and my dear Colonel Newcome."

"Those officers are a very dissipated set of men, I hear. We do not mix with the military at all."

"Not with men of family, like the Marquis of Esmond?"

"A marquis!" Gertrude cried, fidgeting uneasily in her chair. "How dull you will find our life, Miss Carew! You will have no gentlemen to speak to at all."

"But I like ladies' society too, when it is agreeable. Stephen Guest brought Maggie Tulliver the other day, and Aurora Leigh often spends an hour with me, and Ethel Newcome——"

"What! Newcome of High Street—the lawyer?" Miss Yorke put in.

"No—no," Olive laughed. "It is a shame, but I thought you would understand. I am talking of people in books."

"Oh, in books!" Miss Yorke drew herself up, and her thought was that "they did not know they would meet with such impertinence when they consented to call upon this woman." "I look upon reading novels as a sad waste of time," she added stiffly. "It is a practice Gertrude never indulges in."

"But you are fond of reading, Miss Fisher?"

"I have so little time—I do so much fancy-work," Gertrude answered coldly, and without returning Miss Carew's smile.

"Oh, I think women ought to stand up for the novel-writers!" Olive continued gaily, finding that another of those dreadful pauses was imminent. "Think how many incomplete lives they help to eke out—to how many half-starved fancies they offer food."

"I have heard they are very badly paid," Miss Yorke remarked gravely, in the evident belief that she was carrying out Olive's idea; and Olive gave up in despair, having already exhausted Gertrude's views on the subject of music, and wondered if they would ever go.

"I don't see your brother here," Miss Yorke said, when at last she did rise to take leave. "He is a cripple, I understand."

"Nelson has a delicate spine," Olive returned, flushing. "He is not a cripple. He is in the country to-day."

And so, when a formal invitation to dine in George Street had been given and accepted, Miss Yorke's well-appointed carriage rolled away up the quiet little street, to the sincere admiration of all the neighbor's children, who were playing on the door-steps. When the Doctor came in about an hour later, he found traces of tears in Miss Carew's eyes, and observed that she was absent in manner, answering him at random, and listening to every sound in the street, until presently the roll of wheels stopping at the door sent her flying down stairs to catch Nelson in her arms, crushing his immense nosegay of wall-flowers and polyanthuses, and smothering his beloved little face with passionate kisses. Dr. Yorke heard the boy's weak little joyous chatter all the way up stairs, and Olive's exclamation of interest in his recital.

"How she loves him!" he thought sadly. "What a treasure of tenderness that man threw away to whom she gave her heart, poor child!" And a twinge of jealousy shot through the Doctor's big frame as he recalled Olive's confession in the gray old garden walk.

The month that followed his engagement to Miss Carew was the happiest in Robert Yorke's life. True, he had failed in persuading her to quit the public career of which he was half ashamed—on that point the actress was obstinate—but it was pleasant, nevertheless, to take part in her triumphs over the scanty Woolchester audience; to see her face brighten at his approach; to get that swift, demure glance of recognition when he made his appearance in the musty old stage-box he had taken for the remainder of the season; to be allowed to wait for her at the stage-door, where the young men of the company knew him quite well and would exchange friendly greetings as they lit their cigars at the gas and turned their coat collars up round their throats; to be allowed to walk home with her through the quiet streets, and to kiss her fair little hand at the garden gate, while motherly Mrs. Allen held the open door and discreetly studied the starry sky.

There were formal, comfortable dinners, too, in George Street, when Olive's presence seemed to transform the familiar old house into a charmed palace, echoing with sweet words and laughter. Any one a little less frigid and jealous than Miss Yorke must have been won over by the girl's pretty ways; but, seeing her power in the house slipping from her hands, and feeling that her nephew's infatuation for the "player-woman" increased every day, the old lady grew grimmer and grimmer, and harder and more disagreeable, the more poor Olive tried to conciliate her, as the girl did unfailingly, for Nelson's sake. Gertrude, looking upon aunt Elizabeth as an oracle, was fain to act after her behests, and so Olive lost her only chance of a friend.

It was no wonder, the Doctor thought tenderly, that her gayety was somewhat forced and feverish at times, her temper—which he remembered so serene—uneven and fitful, and he silently pledged himself to guard her in the future from all such cold dislike and ungenerous taunts as now made her position with his family a most unenviable one. How he looked forward in those late April days to the evening rambles for which he stole an hour from his work, when Nelson rode a shaggy little pony that Olive had consented to accept for his use, and they four—the Doctor and his sweetheart, Nelson and Jerry—explored every lane and meadow near the town, getting home tired and hungry to tea in Olive's lodgings—tea drunk out of thick cups and saucers, and accompanied by thick bread-and-butter, but free from the sour glances and disagreeable insinuendoes which not unfrequently flavored the cup that was supposed to cheer at Miss Yorke's well-spread table! At these times Olive was her old charming self again; at these times the Doctor told himself, with an exulting heart, that she was beginning to care for him. She was so gentle; she looked at him with such cordial trusting eyes; she appealed to him in so many ways for information or advice—and there was no one to tell him that

"Love's likeness there endures upon all these,
But out of these one shall not gather love."

He was walking one evening by Olive's side over the cool short grass, the little hand of his love lying like a white flower on his dark coat-sleeve. It was Sunday, and bells were ringing sadly across the fields, the birds were growing silent in the trees and hedges, the budding lanes were tranquil and deserted. Miss Yorke had prophesied many evil things of her nephew because he had chosen to walk with his sweetheart in the April dusk on that especial evening, but Robert was too entirely contented to remember anything so disagreeable as he wandered dreaming through that wonderful golden land where most have walked at least once in their lives. Olive too was lost in a fit of musing; the hand that held a few flowers—found by her lover under the hedges—hung down listlessly at her side, her eyes were fixed on the evening star trembling afar off behind a farm-house that stood black and distinct, with its barns and poplar-trees, against the faint green west. Not a breath was stirring; not a distant voice or sound broke the perfect stillness; and, when presently the Doctor laid his hand across hers and looked fondly down at her absent face, Olive started and colored as though the hand had been laid upon her inmost heart, and it shrank from the touch.

"How still it is!" she said hurriedly. "I like these evenings early in the year, when there is something to wish for, something to look forward to. In midsummer, when the grass is ripe and tall, and the trees are in full leaf and flowers in full bloom, I feel oppressed. Even the birds have no heart to sing. They are bewildered by the color and luxuriance of the July days."

"Yes, I have never thought of it before," Dr. Yorke assented, in the puzzled tone of a man not given to sentimentalizing. "But too much happiness is saddening. Even while I walk here with you, Olive, and am not conscious of a single flaw in my delight, those long gray fields and that pale green sky fill me with a sort of melancholy—why?"

"Ah, who knows?" Olive answered with an air of relief, as if she had dreaded being questioned on some other subject. "It is a pretty peaceful landscape enough, is it not? But

'So it is, my dear;
All such things touch secret strings
For heavy hearts to hear.'"

"But mine is not a 'heavy heart,'" Robert whispered fondly, with another pressure of the little hand on his arm.

"What becomes of all these vague little pains and longings and regrets, Robert, I wonder? They come unbidden, and they go—who knows where?"

"Dear, I am jealous of all your regrets. I wish I could blot out every sad thing in your past."

Olive smiled gravely and shook her pretty head.

"That would be to blot out all my past life," she said. "The past is sorrowful, I suppose, because it is past. Some day, when you and I are old, we shall walk here perhaps and think of our young selves, and tell each other how happy we were then; yet now we are conscious of some 'secret string' that has been touched and is still jarring."

"Olive"—the Doctor's light tone changed to one of entreaty; he paused in the breezy, deserted field, and laid his hands on her shoulders, looking down into her fair, upraised face—"Olive, you are not unhappy—you do not regret——"

Olive turned her head and kissed one of the strong, kind hands.

"I should be the most unthankful woman in the world," she said earnestly, "if I were not happy."

The Doctor sighed; and in silence the lovers walked on towards the town. The streets were almost empty; church was not yet over; the windows of the houses looked dull and blank.

"I may come in and see Nelson?" Dr. Yorke asked as they walked along the principal thoroughfare, one or two men turning to look at "the pretty woman in gray" at his side.

"Of course you may, if——"

Olive broke off with a convulsive start, and, looking round surprised as she clung to his arm, the Doctor saw that she was deadly pale, and was pulling with trembling fingers her little spotted veil over her face.

"Olive," he said, anxiously, "you are ill—what is the matter?"

They were passing the club-house, and on the steps a few men were standing in the evening light—a stout old gentleman, a chattering lad with a smooth face and an eye-glass, and a tall, red-bearded man in a suit of gray garments, who had a strap over his shoulders and a railway rug in his hand. Dr. Yorke saw that there was a movement in the group as Miss Carew approached; then he turned and spoke to her again, asking her if she felt ill.

"No," Olive said faintly, trembling from head to foot, "I am not ill."

They turned into the quiet street where the actress lived, Robert Yorke's heart beating with vague uneasiness, and when they reached the iron gate Olive held out her hand.

"I will not ask you to come in, Robert," she said, forcing a smile, "because I——"

"You will allow me to call in the morning to see how you are?" The Doctor spoke a little stiffly. There was an air of mystery about Olive's behavior which displeased him.

Olive's pale cheeks flushed as she observed the change.

"You are not angry?" she said sadly, laying her hand with an air of timid appeal on her lover's arm.

"I could not be angry with you, Olive; but I wish you would allow me to prescribe for you if you are suffering."

For all answer she stood on tip-toe and—there was no one to see in the dusky little street—held her lovely face close up to his. And, blushing like a boy, Robert Yorke bent his tall head to take his first kiss from the lips of beautiful Olive Carew. With tingling veins and throbbing pulse he walked back by the way they had come together; and so absorbed was he in his own blissful thoughts that he nearly ran against some one as he turned into High Street. Muttering an apology, he looked up, and saw the tall man with the red beard who had stood on the club-house steps. The stranger looked at him carelessly, paused, turned on his heel, and walked leisurely off in an opposite direction. It was getting dark now. People were trooping homewards along the clean gray pavement; the last lingering notes of an organ voluntary sounded from a church hard by; lights began to twinkle in the windows.—[To be continued.

RECENT LITERATURE.

Random Shots—by Max Adler, with many Illustrations, by Arthur B. Frost. Price 75 cents. Philadelphia: J. M. Stoddard & Co.

The quality of Max Adler's humor like that of mercy, is not strained, which is more than can be said of most authors who start out to write a humorous book. It is tolerably easy to be funny for a few columns, but when the fun has to be carried through several hundred pages, it takes a humorist of the first water to avoid giving evidences of an "effort" to be witty. Mr. Adler belongs to this class. His fun is so spontaneous and jolly, that even the veriest churl can not help being infected by it. In "Random Shots" we are treated, among other things, to an excellent ghost story entitled "Mr. Skinner's Night in the Under-World." The hero, a shrewd, wide-awake American in making a tour of Europe, is seized with a desire to explore the Horselberg Mountain, the scene of Tannhauser's wonderful adventures. The common sense sort of way in which Skinner conducts himself is simply delicious. He finds himself alone with a ghost who asks, "Are you not afraid to stand in the presence of the awful spirits of the dead?"

"No, I'm not! Certainly not! you can't frighten me. What are you, anyway? Nothing but a little bit of vapor or carbonic acid gas, or something. Afraid! I'm not afraid of anything I can poke my umbrella through, like that and that," and Mr. Skinner stirred about with his umbrella in the middle of the spectre.

"It is strange," said the spectre with the faintest suggestion of embarrassment in its hollow tones, "we are not used to being regarded with such calmness by mere mortals."

"I know it!" answered Mr. Skinner; "I know it. People generally are frightened into fits when they think they see a ghost; but I made up my mind long ago, that if ever I met one, I was going to investigate him. S'pose we sit down here and have a little talk? I want to ask you, for example, how it feels to be a disembodied spirit? Never hungry, are you?" The ghost slowly shook its head. "Costs you nothing for food; don't have to buy any clothes; no aches or pains, or anything of that kind?" The spectre nodded negatively. "I thought not," said Mr. Skinner, "and nothing spent for traveling expenses, either. I reckon, now, if you wanted to take a fly over to America, you could get there in a jiffy. It must be rather agreeable, upon the whole, no taxes and no work to do. But, say, what's the fact about your fellows haunting houses and graveyards? Ever do any thing of the kind?"

"Sometimes."

"I wouldn't have believed it two hours ago. But what's the sense of it? What's the use of scaring people with that kind of foolishness? Why don't you keep off and behave?"

Presently Skinner hears a rooster crow.

"Halloa! What's that? Sounds like a rooster."

"It's a cock crowing outside of us, upon the hill-top."

"Outside, eh? I thought, at first, maybe you kept chickens, and it struck me as kind of singular. I couldn't imagine what a ghost wanted with poultry."

Later, his ghostly guide introduces Skinner to the Hall of Heroes, where gathered about a table are a great host of figures. The guide explains that these "are the immortal parts of men whose deeds upon earth have made their fame eternal," and he points out Arthur and the Knights of the Round Table, Charlemagne, and a few other celebrities. Skinner despite the remonstrances of the ghost, seats himself at the table, and presently rising, he essays a speech. After giving his august hearers a little of the current news of the day, he proceeds to say:—

"However, the matter to which I wished principally to allude, interests you more directly. I say, frankly, that until I dropped in here, I never had any solid faith in the reality of ghosts. I regarded the whole thing as a mass of superstition. I see now that I was wrong. But having confessed this much, I think I ought to say to you, who probably have some influence over the affairs of your kind, that the sooner some one of you starts an energetic reform in the ghost business, the better will be the result. Gentlemen, I am a practical man—a utilitarian, if you will—and I must say that it grieves me, when I look around upon this grave and digni-

fied company, to think of the ridiculous character of the methods in which you manifest yourselves to mankind. If I were a goblin, and I retained a particle of my self-respect, I would keep away from grave-yards at night, I would refrain from haunting houses, and prowling about, making noises to scare timid women and children, I would refuse to come out at so-called spiritual *seances*, and thrum diabolical music upon cracked guitars, and tilt-tables, at the bidding of long-haired and wild-eyed mediums. If a ghost who has been respectable in life cannot put in his spare time in the outer world in better ways than these, my advice to him is to stay in the bowels of the earth right along and to let honest people alone. Apart from the silliness of such proceedings, they are disgustingly useless. Now if I were a ghost, I would use my powers to reveal to living men truths that would be of service to them—such as knowledge of the spiritual state, and information, perhaps, as to the location of veins of coal, of the metals, and so forth; or, if these things are forbidden, I would rent myself out for exhibition for the benefit of good objects of various kinds. A genuine ghost, for example, could always find employment when Hamlet or Macbeth is performed at the theaters; and if you can flit about with the rapidity commonly attributed to you, some of you might earn good wages carrying messages for persons to places which the telegraph does not reach."

For a fuller account of this speech and the rest of Mr. Skinner's adventures, we refer the reader to the book. There are, in all twelve sketches, some extremely funny and all entertaining. We know of no better antidote for "dull care" or the "blues," than a liberal dose of "Random Shots."

MAGAZINES.

HARPER'S MAGAZINE FOR AUGUST.—Lake George, S. G. W. Benjamin; with twenty-three illustrations. The Nautical School "St. Marys." W. H. Rideing; with twelve illustrations. Chautauqua. D. R. Post; with eight illustrations. Little Barbara. A Poem, Will Wallace Harney; with one illustration. The First Mrs. Petersham, Harriet Prescott Spofford; with one illustration. American Forests. G. W. Powell; Miss Mildred's Friend. A story, Elizabeth Stuart Phelps. Snug Hamlet and Hometown, W. Hamilton Gibson; with fifteen illustrations. Watchwords. A poem, Helen S. Conant; Japanese Rock-crystal, Rev. W. E. Griffis; with five illustrations. White Wings, A Yachting Romance, William Clack; with two illustrations. Young Mrs. Jardine. A Novel, D. M. Craik; with three illustrations. The Foreign Indebtedness of the United States, Willard Brown; Mary Anerly. A Novel. R. D. Blackmore. Consequences of Defective Vision, Dr. Edward G. Loring; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record.

THE DESTRUCTION OF OUR FORESTS.—Of a desolation which is recorded far back of the days of Roman or even of Grecian glory, we read that "a man was famous according as he had lifted up axes upon the thick trees." In the days when American forests were considered practically limitless, our fathers were far too famous for lifting up axes upon the thick trees, and the resultant destruction is even now upon us, like the Philistines upon Samson. This destruction comes upon us in many forms, most of which are, in fact, rapidly and terribly cumulative. Here is a beautiful stream of water, for example, which was a great element of wealth to the region through which it flowed. It might not only have continued to be so, but to have gained in usefulness instead of being either dead or surely and swiftly passing away. The numberless little hollows on the hills where were the springs which grew into rivulets to feed it have been stripped of the moisture-economizing verdure with which the Creator clothed them, and so the springs are dry, and the rills no longer murmur their once glad songs of labor as they hastened down the valleys to turn the mill-wheels of mechanical industry. In this one matter of destruction of hydraulic power with which we have been already smitten, hundreds of millions of dollars of annual damage has been and is the actual result. That this drying up of the streams is attributable not only chiefly to deforesting, but almost solely to it, common-sense—which is in fact, the very essence of both fact and philosophy—must make plain to every candid mind. Rain feeds the springs. To feed them economically, it should be gentle and frequent, not violent and at long intervals. Intelligent forest engineering would require that such portion of hills be clothed with a mantle of green trees as by its cooling influence it would more frequently so contract the aerial sponge as to give us showers at short intervals. This is the case in forest-clothed, beautiful Britain. The reverse is true in tree-stripped Spain, whose people have become as proverbial for their hatred of trees as their country has for sterility of soil and sleeping streams. There, and on eastward all through the Orient, a relentlessly brilliant sky and an appalling absence of verdure will teach one as nothing else can how beautiful are clouds that weep, and, in its proper time, how delicious a drizzling rainy day. These deforested Eastern lands are as famous for seasons of blinding storms, and valleys torn by terrible torrents, as they are for the reverse. They will soon find their counterpart in all these characteristics in America, unless we rouse ourselves with a will to understand and to master these evils. Forests promote streams available for our precious manufacturing interests, also by furnishing vast and almost innumerable beds of fallen leaves and of moss, which act on the earth like a huge overlying sponge to check the sudden rush of the rainfall into the valleys and down into the streams. Very rapidly in recent years are mournful instances multiplying in which the manufacturing streams are transformed by freshets from spirits of blessing—to demons of destruction. Forests also promote such steadiness of flow of the streams as to make them sources of national wealth in giving employment to skilled labor, by preventing the rapid evaporation of moisture. Probably more than half the water that falls on a deforested region in a dry season is whisked off by evaporation just at the time when it is most needed to strengthen the depleted mill-streams. The steam-engine, to be of any practical use as a motive power, must have its action controlled by the conservative influence of the balance wheel. Otherwise its wheels would whirl at one time with a fury which would result only in destruction, and then they would move too slowly to be of service. Thus the forest, by increasing the frequency of gentle rains, and so decreasing the volume and the length of intervals between showers, also by regulating their too sudden plunge into the streams, is the great regulator provided by nature for their control in the service of man. All over the manufacturing portions of our country we may find instances where large amounts of capital have been invested to develop and make available our once magnificent and almost numberless hydraulic powers. Trusting to what seemed a certainty of employment for themselves and their families, thousands of skilled laborers have in many cases confidingly made their homes at a point where the stream seemed abundantly powerful and permanent. Then, as the summers came and went, the rivers seemed to sicken, and grow more and more feeble, till there would be a week or two each year in which the spindles and the looms would be silent. As time went on these periods of idleness have lengthened into months, in which the labor struggle for bread and clothing, for means to pay for the humble little home, or debts incurred in sickness, was compelled to be suspended. The cause of all this was that the sources of the river's life had been destroyed or injured by the ignorance, cupidity, or recklessness of men who "lifted up axes on the thick trees" far up the mountains, where the mill-streams had their birth.—G. W. Powell, in *Harper's Magazine for August.*

THE ATLANTIC MONTHLY FOR AUGUST, 1879—CONTENTS: Preaching; The Future of Invention, W. H. Babcock; The Inland Country, Christine Chaplin Brush; An Experiment in Play Writing, Joseph Kirkland; At Kawsmouth Station, Henry King; The Latest Literature of Art, Henry Van Brunt; Petite Marie and Benezet, H. H.; Irene the Missionary, XVIII.-XXII.; Two Years of President Hayes, Walter Allen; A Bit of Shore Life, Sarah O. Jewett; The Deserted Cabin, Mrs. E. R. Lee; "Un Homme Capable," Axel C. J. Gustafson; The Negro Exodus, James B. Runnion; Recent French and German Essays, Thomas Sergeant Perry; William Lloyd Garrison, Lydia Maria Child; Vestigia Quinque Retrorsum. An Academic Poem, Oliver Wendell Holmes; Rural England, Richard Grant White; The Contributors' Club; Recent Literature.

COMPETITION WITH LABOR-SAVING MACHINERY.—The great question, however, for the poor man is, or shortly will be, that of escape from competition with labor-saving machinery by occupying small tracts of land, particularly of such rough woodland as cannot be successfully invaded by machinery of less flexibility and adaptability than the human body. Here flesh and blood have the advantage, and he can live. Making his work easier is a less consideration, but by lightening the labor at home he obtains more assistance from his family in his out-door duties. The time saved from washing and churning may go to weeding and chopping; sewing is convertible into sowing. Thus the certainty of a living and of a fair exchangeable surplus becomes established. It is a life which can be made a success, and which will be one day the rule rather than the exception.

This change will of course strengthen all our institutions, by broadening the base of our national life and multiplying the number of those who have a direct property interest in public prosperity. It will not stop the growth of cities, which will still be needed as great distributing centres; nor will it lessen the number of inventions of a different sort from those last referred to. All that is needed now will be needed then, and there will be more people in a position to obtain what they want. The chief revolution will be the general substitution of unintelligent matter for human bodies in nearly all subordinate work, and the greater liberation of the human mind and will. Concurrent with this will be the more thorough development of the agricultural resources of the country, and the occupancy of its many places now lying waste. All this is not so far away as it may seem.—*W. H. Babcock, in August Atlantic.*

DOMESTIC MONTHLY FOR AUGUST: Review of Fashions; Fashions for Gentlemen; Children's Underclothing, Fans, Jewelry and Parasols, Seasonable Fabrics, Trimmings, Stockings and Shoes; Coiffures, Millinery, Lingerie; Domestic Art. All the foregoing articles are illustrated. The stories are: Lost Alice and Her Three Lovers, followed by The Lost Kingdom, a poem; Miscellany, Small Talk; Household Department; Recent Literature; Mosaics; Answers to Correspondents.

There is one defect connected with summering in the country which quite possibly has been observed, though perhaps not commented upon, by almost every body. It is the mistake of permitting children to play from early morn to dewy eve without the pause of an hour, and without once withdrawing their attention from physical exercise to the small task of reading aloud or even resting for a short hour every forenoon. A daily lesson in any thing that is worth learning is invaluable to children; and plain sewing, taught not only to little girls but to small boys as well, may be made a charming occupation if the mother-teacher will tell a story or read from some attractive book during the lesson. Even children need to rest from pleasure taking now and then, and a spelling-class organized on the old plan of "choosing sides" will be hailed after a few trials as one of the delights of vacation—providing it is done as recreation and not as a compulsory work.

What a pity it is that a disordered toilette is so disparaging to a man, and that he looks so little like a god when he is in any disturbed state of costume. It is so different with a woman! Dishevelled hair, tucked-up skirts, and up-rolled sleeves may make a picturesque *ensemble* for her; but take the very Apollo of the day and tie his cravat on one side, deprive him of his coat, give him an old hat, and set him at work at something perplexing, and see what a monstrous thing he is! Any looker-on will admit that dress does make the man, whatever nature may have done with the preliminaries.—*Domestic for August.*

GLEANINGS.

THE MAN AND THE PICNIC.

UNDER the shellbark hickory tree
The picnic man he stands;
A woful looking man is he,
With bruised and grimmy hands;
And the soil that sticks to his trousers knee,
Is the soil of several lands.

His hair is tumbled, his hat is torn,
His clothes are like the ground;
He wishes he had ne'er been born,
Or born, had ne'er been found.
He glares and scowls in wrathful scorn
As oft he looks around.

At early morn, all dressed in white,
He sought the picnic park;
His face was clean, his heart was light,
His lond song mocked the lark.
But now, although the day is bright,
His world, alas! is dark.

In joyous mood, at early morn,
He sat upon the stump.
But soon, as though upon a thorn
He sat, with mighty jump
He leaped aloft, and all forlorn
In haste he did crump.

For lo, in hordes the big black ants,
With nippers long and slim,
Went swiftly crawling up his pants,
And made it warm for him;
And through the woods they make him dance,
With gasp, and groan, and vim.

And when the rustic feast is spread,
And she is sitting by,
His wildwood garland on her head,
The love light in her eye,
He—woe, oh, woe!—would he were dead!—
Sits in the custard pie.

And now they send him up the tree
To fix the picnic swing,
And up the shellbark's scraggy side,
They laugh to see him cling;
They cannot hear the words he cried,
"Dad fetch! dog gone! dat bing!"

And now he wisheth he were down,
And yet he cannot see,
Just how the giggle, stare and frown
Escaped by him may be;
He knows he cannot scramble down
With his back against the tree.

Sobbing, and sidling, and wailing,
Homeward alone he goes;
Clay, pie, and grass stain on his clothes,
More and more plainly shows;
And he vows to any more picnics
He never will go, he knows.

But the morning comes, and its rising sun
Brings balm to his shattered breeks;
He thinks, after all, he had lots of fun,
And hopefully, gayly he speaks;
And he goes to picnics one by one,
Nine times in the next five weeks. [*Hawkeye.*

JUDICIOUS ADVERTISING.—A man was denouncing newspaper advertising to a crowd of listeners. "Last week," said he, "I had an umbrella stolen from the vestibule of the —— church. It was a gift; and, valuing it very highly, I spent double its worth in advertising, but have not recovered it." "How did you word your advertisement?" asked a merchant. "Here it is," said the man, producing a slip cut from a newspaper. The merchant took it and read: "Lost from the vestibule of —— church last Sabbath evening, a black silk umbrella. The gentleman who took it will be handsomely rewarded by leaving it at No. — San Fernando street." "Now," said the merchant, "I am a liberal advertiser, and have always found that it paid me well. A great deal depends upon the manner in which an advertisement is put. Let us try for your umbrella again, and if you do not acknowledge then that advertising pays, I will purchase you a new one." The merchant then took a slip of paper from his pocket and wrote: "If the man who was seen to take an umbrella from the vestibule of the —— church last Sabbath evening, does not wish to get into trouble and have a stain cast upon the Christian character which he values so highly, he will return it to No. — San Fernando street. He is well known." This duly appeared in the paper, and on the following morning the man was astonished when he opened the front door of his residence. On the porch lay at least a dozen umbrellas of all shades and sizes that had been thrown in from the sidewalk, while the front yard was literally paved with umbrellas. Many of them had notes attached to them saying that they had been taken by mistake, and begging the loser to keep the little affair quiet.—*Saturday Magazine.*

IT is a fact for thoughtful people to contemplate that marriages in the United States are believed to be decreasing in number in proportion to population, and divorces are increasing correspondingly. Several papers devoted to "matrimonial brokerage" have been started to remedy this; and a Cincinnati society for the promotion of marriage is several years old. It is alleged to have over 2,000 members and have branches in forty cities of the country. How much it has actually effected the ostensible object in view is a matter of doubt, but it advertises "a grand picnic" on August 10, on which occasion one hundred couples will be publicly joined in th alleged holy bonds of matrimony. This is a large-sized experiment, and it has a sharp business jingle quite paralyzing to sentiment. Is hymeneal brokerage the hope of the future?

To all who are afflicted with the habit of profanity, and who are desirous of curing themselves of it, the Louisville Courier-Journal suggests that, as a beginning, they resolve, and rigidly adhere to the resolution, that whenever they feel a disposition to swear they will take no other name in vain except that of the Aztec god of war, Huitzilopochtli. That will give their anger a chance to cool and to disappear before they get to the other end of the word, and they will not thus be guilty of the sin of a complete oath. And if Huitzilopochtli won't break them, then their cases are hopeless.

BY AND BY.

THERE'S a little mischief maker,
Who is stealing half our bliss,
Sketching pictures in a dreamland
That are never seen in this,
Dashing from our lips the pleasures
Of the present while we sigh.
You may know this mischief maker
By the name of By and By.

He is sitting by our hearthstones,
With his sly bewitching glance.
Whispering of the coming morrow
As the social hours advance;
Loitering 'mid our calm reflections,
Hiding forms of beauty nigh;
He's a smooth, deceitful fellow
This enchanter, By and By.

You may know him by his winning,
By his careless, sprightly air;
By his sly obtrusive presence,
That is straying everywhere;
By the trophies that he gathers
Where his somber victories lie—
For a bold, determined fellow
Is this conqueror, By and By.

When the calls of duty haunt us,
And the present seems to be
All the time that ever mortals
Snatch from dark eternity,
Then a fairy hand seems painting
Pictures on a distant sky:
Oh, a cunning little creature—
Trust him not, this By and By.

ANACHRONISMS IN ART.—These are to be found in works of all ages. Thus we have Verrio's *periwigged* spectators of "Christ Healing the Sick;" Abraham about to shoot Isaac with a *pistol;* an Ethiopian King in a *surplice, boots* and *spurs;* Belin's "Virgin and Child" listening to a *violin;* and in Albert Durer's "Angel Driving Adam and Eve from Paradise," the angel wearing *a flounced petticoat.* Then we have Cigoli's "Simeon at the Circumcision" with *spectacles on nose;* the Virgin Mary helping herself to a *cup of coffee* from a chased *coffeepot;* and St. Jerome painted with a *clock* by his side. N. Poussin has represented "The Deluge" *with boats;* and "Rebecca at the Well" with *Grecian* architecture in the background. And, in a picture representing "Lobsters in the Sea Listening to the Preaching of St. Anthony at Padua," the lobsters are *red;* yet, it is to be presumed, *unboiled.—Chambers's Journal.*

LOCKSLEY HALL.—Some time since some one asked if Tennyson's "Locksley Hall" had any foundation in fact. It would seem so from the following, which I cut from an English paper:

M. E.

"A clergyman has just died at Lincolnshire, England, who, it is said, saw the man that won the affections of that 'shallow hearted' Cousin Amy, familiar to every one who knows Tennyson's 'Locksley Hall;' and who does not? He was very fond of horses, and extravagant stories are told of his love for dogs. It is to him that the following lines refer:

"'As the husband is, the wife is; thou art mated with a clown,
And the grossness of his nature will have weight to drag thee down.
He will hold thee, when his passion shall have spent its novel force,
Something better than his dog, a little dearer than his horse.'"

The sign, "English spoken here," is common enough in Paris shop windows, but one finds very little English on the inside. The other day an English milliner established in the French capital, put out a sign which said, "*Ici on parler Francaise.*" The French papers have taken this seriously, and complain that it is intended as an insult. They say it is an insinuation that the Parisians cannot talk their own language. The most singular of all these notices, however, was one which appeared during the Exhibition, and read "American spoken here."

ODE TO A COW.

WHY, cow, how canst thou be so satisfied,
So well content with all things here below,
So meek, so lazy, and so sleepy-eyed;
So unobtrusive and so awful slow.
Dost thou not know that everything is mixed:
That naught is as it should be on the earth;
That grievously the world needs to be fixed,
That nothing we can do hath any worth?
* * * * *
Even the cud thou chewest—is not what it seems—
Get up, and moo! Tear round, and quit thy dreams.

The review passed splendidly through all of Job's afflictions, and the exercises had reached the question, "Who comforted Job?" which was confidently put by the pastor and as fearlessly responded to by a little bright-eyed girl in the assembly, whose raised and agitated hand expressed her anxiety to answer. The pastor's eye caught the zealous activity of his little scholar, and pleased to gratify the child's desire, he said: "Well, Gracie, speak up loud now; who was it comforted Job?" And the response came clear and with sincerity: "His sisters and his cousins and his aunts."

Buffalo Express: Joaquin Miller says that men who love the beautiful are never bad. This will be consolation to the man who runs away with his neighbor's wife.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE "LAND OF MIGHT HAVE BEEN."

BY C. H. W.

"Of all sad words of tongue or pen,
The saddest are these: it might have been."

I.

All the long, long hours of sunshine,
Steadfastly I do my part,
Toiling ever, listening never,
To the 'plainings of my heart.
Captive in the thrall of duty,
Dare I not to heed its call,
Murmuring only to its pleadings,
"Patience 'till the even-fall."

II.

Then when with the dusky twilight,
Rest and silence come again,
With a hand all trembling, eager,
I unloose its heavy chain.
Suffer it for one brief hour,
Freedom, happiness to win,
As its fluttering pinions bear it
To the "Land of Might Have Been!"

III.

Ah! you know not of the Palace
Cloud-erected in that Land;
Ah! you know not of the soul-mate
Waiting there with outstretched hand.
You have never heard the greeting
Of that voice so silver sweet—
You have never crossed that portal.
Fit alone for spirit feet.

IV.

Yet within those halls of splendor,
All of earth's immortals stand,
Patriots, Heroes, Holy Martyrs,
Bid me welcome to their band.
Freed from every touch of sorrow
Shrived from every taint of sin,
Radiant with God-given glory
In the "Land of Might Have Been."

V.

Oh, the friends on earth long parted,
Meeting in that blessed Land,
Oh, the greetings of their voices,
And the clasping of each hand.
Every wrong and shame forgotten,
Nothing now their souls within,
But a love serene and holy
In the "Land of Might Have Been."

VI.

All the visions of my childhood,
All my youth's bright dreams of fame,
All my manhood's aspirations,
There have taken form and name.
King and Conqueror, they hail me,
As they bid me welcome in
Through the ever open portals
To the "Land of Might Have Been."

VII.

But the nearest, fairest, dearest,
Of the dwellers in that Land,
Is the one who waiteth ever
At the gate, with outstretched hand.
Lost! oh God, on earth forever,
Lost through sorrow, lost through sin;
But I claim her mine forever,
In the "Land of Might Have Been."

VIII.

Oh, when hand in hand we wander
On that bright celestial shore,
Heart to heart its love out-pouring,
Doubting, fearing nevermore.
Greater bliss no angel knoweth,
Than my bankrupt heart can win,
At the dusky hour of twilight,
In the "Land of Might Have Been."

"HOME PROTECTION."

An Argument for Woman's Temperance Ballot.

BY FRANCES E. WILLARD,
PRESIDENT OF ILLINOIS W. C. T. U.

[THROUGH the courtesy of the Editor of "The Independent," I am able to publish for the good ladies who take an interest in the "Woman's Department," Frances E. Willard's address, delivered at Woodstock, Ct., on the Fourth of July of this year. The address contains so much information and so many admirable suggestions, that I have decided to give it in full; and as it is too long to publish at one time, it will run through three or four issues. I ask for the address a careful reading. Even those of us who differ from Miss Willard on some points, will do well to attentively read what she has to say, for her words are "words of wisdom."

Yours for Temperance, FAITH RIPLEY.]

KING MAJORITY.

ONCE more will the time-honored declaration be made to-day, by a thousand Fourth of July orators, that "the Americans are a free people." But I insist that we are governed by the most powerful king whose iron rule ever determined the policy, molded the institutions, or controlled the destinies of a great nation.

So pervasive is his influence that it penetrates to the most obscure and distant hamlet with the same readiness, and there wields the same potency as is in his empire's capital; nay (with reverence be it said), he is like Deity in that his actual presence is co-extensive with his vast domain. Our legislatures are his playthings, our congressmen his puppets, and our President is the child of his latest adoption. We do not often call him by his name, this potentate of million hands and myriad voices; but, to my thinking, nothing is to-day so vital to America as that we become better acquainted with our ruler. Let me then present to your thought his Majestic Highness, King Majority, Sovereign Ruler of these United States.

KING ALCOHOL.

Permit me now to introduce a different character, who comes to the court of King Majority as chief ambassador from the empire of his Satanic Majesty. I show you the skeleton at our patriotic banquet. It has a skull with straightened forehead and sickening smile; but bedecked with wreaths of vine, clusters of grape, and heads of golden grain—King Alcohol, present at court in radiant disguise. With a foaming beer-mug at his lips, he drinks the health of King Majority; and, placing at his feet a chest of gold labeled "Internal Revenue," he desireth conditions of peace.

THE QUESTION.

Behold in these two figures the great danger and the ineffable hope of the Republic! How can we rouse the stolid giant, King Majority? How light in those sleepy eyes the fires of a holy and relentless purpose?

AN ANSWER.

How? Only by "sweet reasonableness;" only by sweet persuasion; by noble examples; only by honest work based upon fervent and effectual prayer.

Human heads and hearts are much alike. I remember that the great Temperance Crusade of 1874 found me with a beer keg in my cellar, a fatal haziness in my opinions, and a blighting indifference to the temperance reform upon my will. But how did its intense pathos melt my heart; how did its mighty logic tune the lax cords of opinion to concert pitch; how did its miracle of prayer bring thousands to their knees, crying: "Lord, what wouldst thou have me to do?" For myself, I could never be the same after that. As a woman, a patriot, a Christian, my heart is fixed in deathless enmity to all that can intoxicate. The same influences which so transformed one brain and heart are steadily at work to-day in a thousand quiet ways.

The sober second thought of the Woman's Temperance Crusade was organization. The voice of God called to them from the lips of his prophet: "Make a chain, for the land is full of violence and the cities of blood." And so in every town and village we are forming these chains of light and loving help, which we call "Women's Christian Temperance Unions." Sabbath-schools are adopting our plans of temperance instruction; and hundreds of juvenile societies are inscribing on their banners: "Tremble, King Alcohol! We shall grow up." Friendly inns and temperance reading-rooms are multiplying: Gospel meetings conducted by women are reaching the drinking class in hundreds of communities; the Red and Blue Ribbon Movements have attained magnificent proportions; and all this many-sided work is fast concentrating its influence to place the ballot in the hand of woman. Magnificent is the spectacle of these new forces now rallying to the fray. Side by side with the 500,000 men whose united energies are expended in making and selling strong drink, we are working day by day. While they brew beer we are brewing public sentiment; while they distill whisky we are distilling facts; while they rectify brandy we are rectifying political constituencies; and ere long their fuming tide of intoxicating liquor shall be met and driven back by the overwhelming flood of enlightened sentiment and divinely aroused energy.

OBJECTION.—"PROHIBITION A FAILURE."

To be sure, King Majority gave prohibition to Maine; but "prohibition doesn't prohibit" interrupts Sir Sapient, whose remark furnishes a striking illustration of the power of the human mind to resist knowledge. Just take the spyglass of observation, and behold from Kittery to Calais the gleaming refutation of your error.

Less than thirty years ago they had four hundred open hotel bars and ten miles of saloons. To-day Dr. Hamlin, of Constantinople, testifies that, coming home, after forty years' absence, he finds his native State thoroughly renovated from the liquor traffic. Gen. Neal Dow testifies that the law has absolutely driven the sale of strong drink out of all rural districts; and in the larger towns, instead of the free, open sale of former years, it is driven into secret holes, kept by the lowest class of foreigners. Ex-Govs. Dingley and Perham and Senator Blaine and Representative Frye declare that it is as well enforced as the law against stealing; and even sensational journalists have not told us that thieves flourish in the Pine Tree State. Mr. Reuter, of Boston, President of the National Brewers' Convention, held in St. Louis four weeks ago, says: "Formerly Maine produced nearly ten thousand barrels of beer annually; but this has fallen to SEVEN BARRELS, in consequence of the local enforcement of prohibitory law." Surely, this gentleman should be considered as good authority on this subject as a convict is of the strength of his prison-bars!

MAINE AN EXCEPTION.

But you say "Maine is different from any other State." Why so? Are not its citizens of like passions with other men? Turn your glass upon a panorama of Maine as it was in former days. See yonder slothful workers in the harvest-field paying vigorous addresses to the little brown jug; observe its ubiquitous presence at the logging bee, the "raising" the wedding, and the funeral; see it pass from lip to lip around the fireside circle; observe the Gospel minister refreshing himself from the demijohn of his parishioner and host; and be assured that within the memory of men now living these were every-day events. I have this testimony from the most honored residents of Maine, whose recitals involved the words "all of which I saw and a part of which I was." But, as gallant Neal Dow hath it, "Maine was sown knee-deep with temperance literature before we reaped the harvest of prohibition." Let us note the evolution of this seed-planting. Land-owners found that two-thirds of their taxes resulted from the liquor traffic (in cost of prosecuting criminals and taking care of paupers); so they concluded that legalizing saloons for the sake of the revenue was penny wisdom and pound foolishness. Business men discovered that the liquor traffic is a pirate on the high seas of trade, because the more the grog-shop is patronized the fewer customers there are for flour and fuel, boots, shoes, and clothes; and so, in self-defense, they declared for prohibition. Church people found that fifteen times as much money went to the dram-shop as to the church, and that the teachings of the one more than offset those of the other with the young men of the State. So they perceived they could not conscientiously ally themselves with the liquor traffic by their votes. Those interested in education learned that enough money was swallowed in drinks that deteriorate the brain to furnish a schoolhouse for every fifty boys and girls, and to set over them teachers of the highest culture: and they saw it was unreasonable to defend the liquor traffic. In short, the majority came to believe that, between the upper and nether mill-stones of starving out saloons, on the one hand, and voting them out on the other, they could be pounded to death; and they have so pounded them. The question of selling as a beverage the drinks which we know by centuries of demonstration will so craze men that they will commit every crime and show the subtlest cruelty to those they love the best is not today an open question with either party, any more than trial by jury or imprisonment for theft. They had a thirty years' war before the declaration of this blessed peace; but what are thirty years when crowned at last by the surrender of King Alcohol to King Majority?—To be continued.

WOMANLY CLIPPINGS.

Extract from a Paper Read by Mrs. Isabella Candee before the Illinois Social Science Convention.

WHAT a power for good in any circle of society is a refined, cultivated, pure and noble woman. How cordially is she received, how heartily is she deferred to. Almost unconsciously the profane man drops his pet oaths, the coarse and vulgar man endeavors to appear a gentleman, and the frivolous, impertinent and rude, put aside their various weaknesses when in her gentle, gracious presence. The worst, most wicked and depraved men respect and honor a pure woman. With such an influence over evil, why is it there is so much unrebuked, why is it that good women quietly close their eyes and ears to the strong undertow which is dragging in and destroying the lives of so many of our youth? O mothers! sisters! wives! here is one of your opportunities, here is the potentiality of a pure, wise and courageous womanhood! Open your eyes and see the condition of things around us. Society has two codes of morals, unwritten, but none the less strong and binding—one for man, another for woman. As little children born of the same mother, nurtured under the same roof-tree, taught the same lessons of honesty, truthfulness and affection, in their early years, why is it that their paths are allowed to diverge as they grow older, and while modesty, delicacy and propriety, are demanded of the girl, coarseness and indelicacy, are winked at and openly excused in the boy? These things ought not so to be—they are sapping the foundations of our social life, and to the mothers we must look for a remedy. A wise, true motherhood, enlightened and thoroughly trained with the dignity and prestige of equality before the law, can alone reform the fast-increasing evil. The same purity in thought, in word and deed, required of the sisters, should be insisted on from the brothers. O young mothers, who hold your bonny boys close to your hearts, rejoicing in their innocent prattle, and shuddering at the thought of years to come when they shall go out from your encircling arms, see to it that they are as carefully taught true purity as the little daughters who give promise of a perfect womanhood! Teach them that in the sight of God there is no distinction in sin. Teach them wisely, reverently and plainly, their obligations to God and to themselves, and the beauty, strength and glory of the pure and innocent manhood! So shall we have more dutiful sons, more loyal husbands, fewer broken hearts and blasted homes, and gray hairs brought down in sorrow to the grave! Alas! that we cannot teach our sons that society, as well as God, will hold them to a strict account for profligacy and evil-doing. Tell me whose fault it is that the boy or young man feels that vice is at a premium, and, virtue little valued, when he perceives some companion well known to be "fast," because he is wealthy or of fine address and possessed of pleasing manners, or is a member of some "old family," cordially received by his mother and sisters in his own home? How much attention, think you, will he pay to the gentle warning of his mother against an intimacy with such a person "because he is not a good companion for a boy" when he sees her smile upon him in society, and permit his attentions to his sisters? What restraint is there upon the desire of men to frequent gambling halls, saloons, and houses which virtuous women blush to name, when they know that from these haunts of sin and shame they can go direct to the drawing-rooms and parlors of "best society," enjoying at the same time the dregs and cream of life at pleasure? What blindness is this that closes our eyes to shameless folly in the man, and yet makes us so ready to detect it in the woman! I have known good Christian women to speak scornfully and angrily of those poor, lost sisters whose lives are like the whirlpool, in which, once caught, the wrecked vessel is carried helplessly around, until engulfed in the boiling vortex and lost forever in the blackness or darkness; who are shut out from all thoughts of happy, virtuous homes and little children's holy love, and suffer in a bondage from which there is no escape this side the grave, and I have known these good women to receive with pleasant smiles and cordial welcome the men who have placed and who keep these poor, lost sisters where they are, with no word of protest, no act to show the disapproval which they ought to feel. How long before we shall dare refuse to receive into our homes or recognize elsewhere the man who makes his boast among his fellows of his evil deeds? When we shall dare to frown upon this dual life of respectability and sinfulness, of seeming virtue and actual vice, demand of our associates that purity that they demand of us? When women in a body have the courage to do this, the fearlessness to lift up their united voices in earnest protest, and the bravery to act in concert, we shall have a different state of affairs, and not until then.

Sound Argument.

A tobacco discussion has been going on in the Cleveland Herald for some little time, and in answer to some of the statements made, Florence G. presents the following: Fannie A. A. says: "Let our husbands chew tobacco if they wish; it's a right to them just as sacred as the right of our jewels is to us." Arguments applying with equal force to liquor-drinking, opium eating and other pernicious habits, while virtually precluding all efforts at reformation! No man has a right to indulge in evil habits or set a bad example before his children or neighbors; and should he do so, it is the duty of the wife to labor for his reform. Men frequently expend $5 a week for cigars—a sum sufficient to support a small family, and, if profitably invested, would amount to a handsome fortune in an ordinary lifetime. Still, thousands of men indulge in it while their families go ragged and hungry! "The right to chew tobacco" is about as "sacred" as the right to drink liquor or gamble; and if wearing jewelry should produce a sallow complexion, an offensive breath, discolor the teeth and lips and cause an incessant flow of expectoration, as is the case with tobacco, few ladies, I opine, would claim the "sacred right" to wear it.

Joe Norris will not admit "tobacco kills any one;" his (?) grandparents used it, living to a good old age—though according to medical science, it is a deadly poison, causing various fatal diseases which destroy many of its victims—while it is not certain that his grandparents would not have lived longer without it as others have done. If a victim abstains from it a single day, he will be enervated, sick, out of mind and temper, with a craving unappeasable appetite for tobacco—a condition utterly incompatible with good health. Yet similar arguments are constantly paraded by the victims to drink, opium and even arsenic, who delude themselves into the belief that such habits are not injurious, though myriads are annually destroyed by them.

Another writer favors the use of tobacco because furnishing employment to cigar-box manufacture! So liquor selling gives employment to keepers of prisons and asylums, criminal courts, sheriffs, policemen, lawyers, doctors, coroners and hangmen: but such employment, like the manufacture of cigar-boxes, instead of aiding our working classes, adds to their burdens and is of doubtful utility. Workingmen complain of lack of employment when they might save hundreds of millions yearly which they unwisely squander for tobacco and intoxicating drinks which only tend to demoralize and destroy them! Wives should not encourage such habits, but labor to suppress them.

FLORENCE G.

Usefulness in the Family.

THE co-operative principle in education is nowhere seen to better advantage than in the family. The girl is strengthened and vivified by the bat and ball, the oars, the bow and arrow, or the skate, as much as is the boy, and she needs, and her family need, the sparkling vivacity which only out-door amusements can give; but the girl who has two beds to make has not so much time for recreation as the boy, who uses, but who makes none. The care of one room for each would be a happier adjustment. At a school which I lately visited, the boys, under the care of a matron, were taught to make their beds and to keep their rooms in order. They showed no incapacity for the work. Their clean beds with white covers were as well made as though done by their sisters. Neither boots, stockings, jackets, shirts nor collars were on the floor for somebody else to pick up.—*Cairo Gazette.*

CORRESPONDENTS' CORNER.

DEAR EDITOR:—Will you inform me, through the columns of the RURAL, what will remove the freckles from my face? A. G. D.

DEAR RURAL:—Will some of the RURAL readers please tell me how to cure split hair? I have tried cutting it off at new moon, but it does not seem to stop splitting. Also, what will make the hair grow thick, and not spoil it? SWEET SIXTEEN.

MISS RIPLEY:—I am greatly interested in your department of the RURAL and in those productions written concerning study. May August's "Methods of Study" I like very much, and would be pleased if she will tell me what books will be entertaining and beneficial to read in connection with the study of Roman, Grecian and English histories?

TIPTON, Ia., July 3. A SUBSCRIBER.

PHONOGRAPHY.—The science of phonography, or short-hand, has within the past few years become quite a crowded profession, and it is not advisable for students to make a specialty of it with a view to profitable employment. The tenor of the press in this country, these days, is to save space, and not to give verbatim reports except in cases of important trials, speeches of National interest and other wordy events for which there is a large public demand. In large newspaper offices, where a few years ago short-hand men were kept and well paid to be ready for emergencies, now the art is hardly considered, as half a dozen of any of the reportorial corps can transmit sounds to paper with all the accuracy and velocity that at one time belonged to few journalists. There is some field for experts in large commercial houses, where a heavy correspondence must be dictated, and in prominent law offices and courts. These places, however, are filled mostly by young men, and, if of a very paying character, favorites are always accessible to fill up occurring vacancies. In a word, what was once regarded as a marvel is now merely looked upon as an accomplishment (and a very useful one it is), and I cannot safely encourage an invalid lady to attempt to battle in a business that requires full vigor if compensating work were obtainable. T. A. G.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

BATHS FOR FARMERS.

M. W-F.

ONE very great reason why farmers become "stiff and old" before their time, is from their lack of bathing and *thorough muscular* exercise. The professional man who is fatigued in body, seeks to restore his wasted energies with cold water, and the use of dumb-bells, which, no matter what a man's occupation may be, straighten out the muscles and bring them all into action as nothing else does. But the farmer, when he is fatigued, what does he do? In nine cases out of ten he seeks his recuperation in inactivity. He goes to bed without a bath, and begins his day's work without a bath. Once a week, like Aunt Chloe, he has a "clarin' up time," by making himself clean.

And what is true of the farmer, is, in large part true of the farmerine. To take a bath requires time and trouble. So does everything else that is of value. It should not be taken when one is extremely fatigued at night. But in the morning, after a night's rest what is more invigorating! Salt should always be added and with freshly-drawn water one has no need to go to the seaside for sea bathing. A sponge, or towel bath agrees with many people much better than the immersion of the body in a tank-tub. But what is very satisfactory—especially after one becomes accustomed to it—is the hip-bath tub, in which one may sit and with a mug, or pitcher, pour the water over the shoulders. The largest size of these tubs, should be chosen, and the material should be strong and well put together. Zinc is the best. Those of tin are not worth buying. A good zinc tub costs about $6.50. If in daily use it will need to be taken once a year probably to the tinsmith to have a small leakage in the bottom stopped, unless indeed, the owner has the happy faculty of doing his own "tinkering." To be able to solder basins and pots and pans, is an accomplishment well worth the trouble of boys and girls to acquire, and the tools necessary for the work are few and inexpensive. Hair mittens are excellent for producing a friction on the skin, after a bath, but the bath towel, which is of large size, of heavy quality in cotton, is preferable for every-day use. It costs from 25 to 30 cents. A pair of hair mittens costs $1.50. It is a custom in some parts of Germany for the head of the household to pay the family physician a certain sum per annum to keep his family well. It is a good plan. The doctor drops in now and then, asks about the diet and sanitary habits of the various members of the family and so has it in his power to apply the ounce of prevention. It is quite true that if people took half the trouble to keep in health that they take in order to get well when once ill, there would be comparatively little disease. And one of these sanitary "troubles" is the daily morning bath, which soon becomes a luxury. The time consumed in taking it, is quickly made up by the strength and vigor it imparts. And if one cannot afford the bath tub, use a large basin that will hold at least six quarts. But have the tub if you can. One had better go without a Sunday suit than a bath tub. Cold water will do more for the religion and morals of most persons than will the Sunday sermon. And like obedience to the fifth commandment, let your acquaintance with it be intimate so that your days may be long in the land.

Bryn Mawr., Pa.

RASPBERRIES—CUTHBERT AND MONTCLAIR.

THIS is the first season we have had raspberries for family use from the new red varieties, Cuthbert and Montclair. Out of our forty or more varieties, we would select the Cuthbert first and Montclair next, for table use. The Cuthbert is the firmer of the two and a little higher flavored, while the fruit is about the same size, although the Montclair is the darker colored, and one, so far as we can see, is as prolific as the other. We advise our lady readers to plant the above sorts, feeling confident that they will be pleased with the results, especially as they have proven themselves thus far to be among the hardiest red raspberries in cultivation.

Nasturtiums.

Those of our friends who planted nasturtiums for pickles need not feel alarmed at their not setting their fruit early in the season. They do not usually fruit freely until the nights grow cool.

DOMESTIC RECIPES.

Drying Okra.

IN reply to an inquiry as to the manner of preparing okra for winter use, Miss Taplin writes as follows: The pods should be cut after they are fully matured, but before they are stringy and tough. Cut in slices and string on twine, and then hang in a shady place out-of-doors or in an airy attic. It is best not to place them in the sun, as that is apt to make them leathery. After a few days, when perfectly dry, they should be put away in paper bags. Soak in water for half an hour before using. This process retains the flavor perfectly.

Cleaning Silver Spoons.

The disagreeable discoloration of egg can be readily taken from silver spoons by washing them in potato water—water in which potatoes have been boiled. It is much better than salt, as it does not scratch the metal.

The taste of fish may be removed very effectively from steel knives and forks by rubbing with fresh orange or lemon peel.

Maywood, New Jersey.

A Nice Tea Cake.

One-half cup of butter or cream; one of sugar; one egg; one-half cup of thick milk or buttermilk; a teaspoonful of soda; handful of currants. Flour to the proper thickness.

For the Toilet.

Of white wax, oil of sweet almonds, spermaceti and white soap each one-fourth ounce; one pint of rose water or elderflower water; best cologne three ounces. Cut the wax, sperm and soap very fine; put into an earthen vessel with a gill of the rose water, set into a dish of boiling water and let stand until dissolved. Then add first the oil of almonds, then the rose water and cologne.

Lewis Co., N. Y. MRS. G. COLLINS.

To Wash Black Calico, etc.

To wash black calico, fawn colored lawns or fancy hose, wash in *cold* water from first to last, and the colors will not run or fade. Dry in the shade. This method was adopted by the old colored laundresses of the South, and was the secret of their success. GRANDMOTHER.

QUESTIONS ANSWERED.

Corn and Beans—Salting Down.

Mrs. Annie D. asks us to republish the directions given last winter for salting down green corn and beans. Also, she wishes a recipe for coloring dark blue.

ANS.—The method for preserving corn and beans for winter use, was contributed by Mrs. E. E. F., in the RURAL of Feb. 8, and is as follows: "Cut the corn from the cobs without cooking. Have an earthen pot ready; first put in a thin layer of corn, then a layer of salt, and so on alternately until the pot is full. Then cover with a plate pressed down so that the brine will cover it and exclude all air. Before the corn is used it will require to be freshened by soaking it over night in water. A teaspoonful of sugar, added in cooking, improves it, Beans (string) can be kept in the same way. Though I've never heard of it, I see no reason why peas, shelled, couldn't be kept too. The corn and beans must be packed as soon as cut, or they will spoil."

As you do not state whether the receipe should be for dying cotton or woollen, we will append directions for both, furnished us by a friend who attests their reliability.

Blue on Cotton.

DISSOLVE two pounds and a half of copperas in fifteen gallons of water; put in about ten pounds of cloth and boil two hours. Take out, rinse in clear water, refill the kettle with clean water and add one-half pound of prussiate of potash. Boil the goods in this for thirty minutes, lift out and slowly add one-half pound oil of vitriol, then return the goods and boil half an hour longer. Rinse in cold water and dry.

Blue for Woolen.

ONE gallon of water; a wineglassful of sulphuric acid, and a tablespoonful or more, according to the shade required, of imperial blue. Stir all together, put in the cloth and boil from twenty minutes to half an hour. Wash in a weak solution of soap lather. This quantity will color two or three pounds of goods.

If it were our own case, we should try Leamon's Aniline Dyes, because we believe them to be cheaper, of less trouble, and if the directions are strictly followed, more likely to give satisfactory results.

A TEST FOR LINEN FABRICS.—To distinguish cotton when woven into professedly linen fabrics, it is well to know that linen fiber, when dipped in an alcoholic solution of rosolic acid, next in a concentrated aqueous solution of carbonate of soda, and finally washed several times with a strong soda, attains a beautiful red color, while the cotton fibers are not dyed. Before testing, the dressing should be washed out of the goods and a few threads raveled out on each of the three sides.—MRS. HAYNES.

CUT this out to-day for use: A speedy cure for burns from fire-crackers or from any cause: Wet a cloth and sprinkle upon it a liberal allowance of bi-carbonate of soda (common cooking soda), bind it around the wound. This will speedily relieve the smart and burn. It is a harmless and thoroughly efficient remedy. If no cloth can be had promptly, wet the part and sprinkle some of the dry soda upon it.

News of the Week.

MISCELLANEOUS.

Monday, July 28, 1879.

The yellow fever exodus from panic-stricken Memphis still continues. The number of recorded cases already number upwards of 140 and the deaths about 30. Both of these figures are doubtless below the reality, as in all cases within our knowledge, the authorities of plague-smitten cities are apt to be remiss in recording the early cases of the pestilence, through fear, sometimes, of frightening their own citizens, but oftener through dread of preventing customers from coming to the place. The type is said to be milder than that which afflicted the place last year; more easily manageable, and therefore less fatal. Ordinarily Memphis has a population of about 48,000, of whom one-third are "colored;" now the colored number about two-thirds of the residents. "Niggers," though attacked by last year's pest, are, as a rule, yellow-fever-proof, and those in Memphis refuse to leave. The Government has sent tents and rations to the neighborhood of the city, where an encampment of the poorer inhabitants is about to be established. Trouble is feared from the surrounding darkies who having heard of free rations, threaten to quit work and go in search of them, after their lazy fashion in the good old days of the Freedmen's Bureau. Some hint at an intention of entering the city and pillaging it. There will soon be hardly enough "whites" there to protect the place. About 10,000 of the present inhabitants recovered from the epidemics of 1867, '73 and '78. These are, as a rule, fever-proof, and will stay; but the majority of them are women and children. The plague has arisen from the germs of last year's pestilence, that had not been destroyed by frost or disinfection. The place has had no regular government of late, as it voluntarily resigned its municipal character some time back, in order to avoid the necessity of paying its debts. The town therefore has not been properly cared for in the way of cleanliness. It would probably have been a stroke of economy in the end to have footed the bills. Many of the fugitive merchants have opened shops elsewhere and will never return; capital and population are kept away by bad faith and pestilence, and the progress of the place not merely retarded but put a long way back. Fugitives from the city are not well received elsewhere in the South. Indeed, in many places a "shot-gun" quarantine has been established, and then the poor wretches fleeing for life are apt to lose it, if they are foolish enough to stop from choice or necessity. They are dying of the disease, here and there, where they have rested. It's a ticklish thing to leave a plague-stricken place, as one is apt to carry inside him the germs of the disease, which are sure to develop where few or none are acquainted with the proper treatment, and all are afraid to give the persistent and careful nursing that is more efficacious than any medical treatment. A male refugee died across the river in Brooklyn on Thursday last, and a female up-town here on Friday, both having fallen ill of the malady soon after their arrival. The family with whom the woman here was staying have been sent to quarantine, as one of them showed signs of having "caught" the disease. Several cases have also occurred at Mississippi City, down on the Gulf, but all the other places usually visited by the saffron demon report that as yet it has not made its appearance. Every place—county, village, town and city—liable to the pest, is taking rigid precautions against it.

Since the dispersion of Congress our politicians have been rather quiet; but they are again about to make themselves heard throughout the land. John Sherman has been sounding one of the "keynotes" for the approaching Republican campaign up in Maine—Blaine's State; and it is thought a good stroke of policy that he should boldly invade the special "stumping ground" of his great rival for the next Presidential nomination. The Pennsylvania Democrats held their convention in Harrisburg last week. Their platform, said to be mainly the work of that dett politicai carpenter, Judge "Jerry" Black, is probably a fair sample of what those of other "hard-money" Democratic States will be. It insists on the subordination of the military to the civil authorities; denounces all interference with "the right to a free ballot;" declares that Mr. Hayes is the "representative of a conspiracy only," and his "claim of right to surround the ballot-boxes with troops and deputy-marshals to intimidate the electors," and his abuse of the veto-power, "an insult and a menace to the country;" affirms that the Democratic party as a whole favors a Constitutional currency of gold and silver, and of paper convertible into coin;" denounces the Republican system of rings, subsidies, and misappropriation of the public moneys; renews to the workingman the party's expression of sympathy for honest labor, "and its promise of protection in its rights;" insists that the railroads of Pennsylvania must "accept the constitutional amendments of 1873;" denounces the recent attempt made "under the personal direction of ruling Republican leaders" to pay for the Pittsburgh riot losses out of the State Treasury; and declares that the present condition of the State finances is "a sufficient illustration of the reckless financial mismanagement of the Republican party." The Greenbackers nominated a candidate on the same day with the Democrats, but it seems to be admitted on all hands that their vote will not this year affect the result.—Ben Butler is again about to put life into Massachusetts politics by offering himself as a candidate for the Governorship. A convenient "friend" has been found to question him on the matter, and the ex-Essex statesman declares himself once more in the field. It's always splendid fun for outsiders to see Ben laying lustily about him in a *melee*. Communism has been curiously illustrating its principles by the operations of the Board of Equalization of the city of Toledo, Ohio. The Nationals control a majority of the Board, and as soon as they got possession they went to work to raise the returns of personal property according to their fancy. According to the Cincinnati Gazette, the principles on which the "raising" has been done have been partly political and partly commercial. Democrats are said to be "raised" only slightly, unless they are such Democrats as stand out against both Ewing and the Nationals. Economically, the rule acted upon is to make the "money kings" disgorge. To show how "raising" works, we may mention that some of the returns have been altered as follows: $550 to $30,300, $500 to $22,600, $225 to $15,275, $8,900 to $236,473. This last was in the case of a national banker, a member of a class whom it was found necessary to deal with severely. Another is "raised" from $3,910 to $100,615. Among the merchants, manufacturers and bankers affected a good deal of consternation has been caused, and they propose to contest the matter in the courts.

Sitting Bull is across the border at the head of at least 2000 braves. Gen. Miles with less than a thousand men in all is hunting for him. Several skirmishes have already taken place between the troops and detached parties of redskins. It is feared by many that ambition for a major-general's stars may induce Miles to risk too rashly Custer's fate. Storms of extreme violence have been unusually prevalent this year, doing a world of damage here and there throughout the country. Last Saturday one of them visited the valley of Bear Creek one of the tributaries of the Monongchela River in Pennsylvania, and flooded the whole bottom region, destroying crops, fences and many houses and outbuildings. Several lives also were lost. At Pittsburgh the river rose with extraordinary rapidity and enabled the shippers of coal to send off upwards of 12,000,000 bushels the first day of the flood. Previously the water was too low to admit of shipment and many of the river towns were threatened with a coal famine. Our readers will remember that social breeze raised some months ago by Judge Hilton's refusal to entertain Jews at the Union hotel, Saratoga. Well there is now a social hurricane raised by a very similar occurrence. Two brothers, Corbins, bankers of this city, are the chief stockholders of a short railroad running from Brooklyn to Manhattan Beach, at Coney Island, our nearest watering place, and also of the hotel and other accommodations for visitors at that place. Neither of the brothers likes Jews personally or from a business point of view and, what's more, they are imprudent enough to say so. They say that they don't want Jews at their hotel or about it, nor do they seek Hebrew patronage on the railroad. They allege that Jews are disagreeable, aggressive, obtrusive "nasty" folks who spend little and want a great deal for it and that Jewish pretensions and conduct generally are unpleasant to other guests at the hotel and to other passengers on the road. The Jews, of course, are indignant at this wholesale defamation and threaten to make the bankers feel the effects of their wrath; but the latter say the Union hotel at Saratoga was never so full of excellent guests as it has been since Hebrews were excluded.

Canadian papers say the harvests throughout the Dominion promise to be most abundant. William H. Vanderbilt last week purchased four million dollars of United States 4-per-cents, each bond of a value of $50,000, as an investment for his family. E. H. Walker, the statistician of the Produce Exchange, says, as compared with New York, the receipts of flour and grain at Baltimore, Philadelphia and Boston for the first half of 1879, show a large gain as compared with 1878, the increase being largely in wheat. The movement during the past week shows more favorably for New York than for several previous weeks. Buford, the Kentucky murderer, who killed Judge Elliott a couple of months ago, because a verdict rendered by the court of which the Judge was a member, went against his sister, has been found guilty of murder and sentenced to imprisonment for life.

The steamship State of Virginia, 2500 tons burden, from New York for Glasgow, went ashore on Sable Island, off Nova Scotia, in a dense fog Saturday week, and is likely to be a total wreck. She had 136 crew and passengers. When landing the passengers on the island, four women and five children were drowned. Among the lost was Mrs. Walker of Elmira, N. Y., who leaves a husband and five children. The steamer belonged to the State line and was valued at $400,000 to $500,000, while the cargo was worth $350,000. Capt. Moodie, her commander, was 25 miles out of his reckoning when the vessel struck, it being very foggy. The Canadian tariff has started up a brisk business in smuggling all along our northern frontier, but instead of being Yankees as formerly, the smugglers are now tricky Kanucks. Canada has just sent out 13 farmers to instruct the Indians of the Northwest in tilling the land. These farmers are paid $730 yearly salary, are furnished with stock and tools and a year's provisions and, after that time, are expected to make their farms self-sustaining with the privilege of turning any surplus produce to their own account. Secretary Sherman denies that Mrs. Jenks is saddled on the Treasury Department.

FOREIGN.

There seems to be a good deal of dissension among the Bonapartists in France. With them Plon-Plon was never popular. Although resembling the Great Napoleon more closely in face than any of his kindred, he was always too liberal to suit their imperialistic tendencies; and now the staunchest adherents of the late Prince and his father are either lukewarm supporters, indifferent onlookers, or bitter opponents of his claims to the position of the head of the family. His young son, Victor, whom young Napoleon nominated as his successor, is far more popular, and if the Imperialists even unite it is probable it will be upon him. Meanwhile the father is about to visit the ex-empress at Chiselhurst, so soon as her mourning has abated. The Republic seems to be showing a petty spirit in its hostility to those officers of the army who manifested any special

regret at the tragic death of the young prince, The last reports of the way this occurred show that his end was braver and nobler than that of any of his family. Finding escape impossible, he turned on his foes single-handed on the desolate reedy waste, and fell with every wound in front.

The Ex-Empress, according to the latest cablegram, has written to the Queen begging that no penalty be inflicted on the courtmarshaled Lieutenant Carey who was in command of the scouting party that abandoned the prince to his fate. Some of the French rivers are rising rapidly and the floods are expected to do a great deal of damage to the farming interests; others, having done a world of mischief, are retiring to their beds. The former are chiefly in the south the latter in the north of the country. Germany having taken control of all her railroads so as to be able to use them most effectively for military purpose, the French Government is thinking of buying all the roads in the country so as to be ready for any Teutonic movement. The relations betwen Russia and Germany are reported to be not quite so cordial as formerly. The large German population of Livonia and other provinces of Russia bordering on Germany, seem anxious for annexation to the Fatherland, a sentiment not very pleasing to the Czar. Moreover the recent action of the German Goverment in imposing taxes on imports of grain and stock, deprives Russia of an extensive market or, at best, greatly lessens here profits there, while the restrictions placed upon railroad traffic have virtually shut the Czar's dominions out from trade with other countries through German sea-ports. Then, again, the czarowitz's influence is said to be in the ascendant in Russia over which he may ere long rule, and that influence has never been friendly to the aggrandizement of his warlike neighbor.

The latest reports from South Africa say that the Zulu war is virtually over. Lord Chelmsford has fought a severe battle with Cetewayo's forces headed by that chief, and completely routed them. Their losses are said to have been upwards of 1000 killed and a very large number of wounded. The British loss was trifling. The savages attacked their foes with the utmost bravery, having several times charged the hollow square into which the English troops were formed. Cetewayo has fled to the north, a great many of his chiefs with their men are surrendering, and speedy peace is promised. European crop reports this week are nearly repetitions of those sent last week. The yield of rye in western Russia and Germany, the great local food crop, is estimated at 60 per cent of the usual supply. Wheat in southern Russia is deficient. Central Europe from the Carpathian mountains south to the Danube will have little, if any, surplus to export. Italy has already begun the importation of wheat, and so far the supplies from Odessa are absorbed in the Mediterranean ports. The imports of food products into France during the first six months of the current year, have largely exceeded those of a like period in 1878, and the potato crop, an important food supply, is reported to be failing. The acreage of wheat in Great Britain is reported 10 per cent less than last year, the condition of wheat worse and the stocks of wheat in British cities are about one half as large as a year ago. Elaborate reports of failing harvests in the Old World are often current here and abroad just as the first wheat of the American harvest reaches the market; but there appears to be no doubt that this year will see an unusually large export from this country. The amount of grain needed to make good the deficient supply abroad is estimated at upwards of 350,000,000 bushels half of which amount this country is expected to supply.

When the report of the Swiss centennial commissioner on American watch-making was read to crowded meetings of watch-makers at Neuchatel and Geneva, the general expression was one of abject despair. Work was suspended on the Genevese school of watch-making then being erected, and the Canton council appointed a committee to consider what other industry could be induced in place of watch-making.—At Brussels, Belgium, the police have arrested the librarian of the Jesuit College, which is under surveillance in consequence of the confessions of Von Haame, a former clerical agent, arrested for posting placards threatening the life of King Leopold. The librarian is suspected of bribing Von Haame to post the placards.

At Friday's sitting of the London common council, the report of the committee on markets was adopted. The report recommends, in view of the trade in American cattle, that an extra lairage be provided at the foreign cattle market for 1,000 head of cattle and 10,000 head of sheep; also, that ten additional slaughter houses be built. This extra accommodation, it is estimated, will cost £25,000. An arrangement has been concluded with the General Steam Navigation Company which will secure the use of their vessels for the transhipment of animals brought from America.

VARIOUS.

Odd folks here and there are described in the newspapers. Roxbury, Mass., has an eccentric tramp, who lives in a cave during the winter and spends the summer in making begging excursions to neighboring towns. He never says a word, and his dress consists entirely of old bootlegs fastened together with leather strings. A small wagon, drawn by two goats, and containing a helpless, shriveled man, attracted attention in Hagerstown, Md. He said that he had traveled in that manner or many years, and called himself "the American Tourist." He is entirely helpless. His wife and four children accompany him and attend to his wants, getting their living by the sale of a temperance song and other small articles. Jefferson Stevens, who lives near Sulphur Springs, Ky., concludes that he is gifted with peculiar powers, of which he lately gave a street exhibition. He held a forked dogwood switch, like those used by wizards, in his mouth, and told the crowd to ask any questions they pleased,

A pair of tramps turned up at Des Moines, Iowa —Peter Carlisle and wife—who were on their way to Leadville from the Pennsylvania coal regions. They had pushed a handcart all the way, containing their baby girl and a few household utensils. Carson Carr of Moodie, Cal., will on no account walk a step, but always runs, no matter if the distance is only a few feet; while Mrs. Main of Chicago will neither walk nor run, although physically able to do either, because she thinks her legs will drop off if she stirs them. The story comes from Pittsfield, Mass., of the discovery of a cannibal, who for years has lived near that city. He says that early in life he ran away from home and went to sea. He was early shipwrecked on one of the South Sea Islands, where cannibalism was practised and idolatry was the worship of the natives. How long he remained there he does not know, but he learned to enter into their savage rites with a good deal of zest, and he confesses to have acquired a taste for cannibalism.

A statement has been issued by the War Department giving the number of men furnished the Union army by each State and Territory and the District of Columbia from April 15, 1861, to the close of the war of the rebellion. It shows that the total number of volunteers was 2,678,967, divided as follows:—Maine, 72,114; New Hampshire, 36,629; Vermont, 35,262; Massachusetts, 152,048; Rhode Island, 23,699; Connecticut, 57,379; New York, 467,047; New Jersey, 81,010; Pennsylvania, 366,107; Delaware, 13,670; Maryland, 50,316; West Virginia, 32,068; District of Columbia, 16,872; Ohio, 319,659; Indiana, 197,147; Illinois, 259,147; Michigan, 89,372; Wisconsin, 96,424; Minnesota, 25,052; Iowa, 76,309; Missouri, 109,111; Kentucky, 79,025; Kansas, 20,151; Tennessee, 31,092; Arkansas, 8,289; North Carolina, 3,156; California, 15,725; Nevada, 1,080; Oregon, 1,810; Washington Territory, 964; Nebraska Territory, 3,157; Colorado Territory, 4,903; Dakota Territory, 206; New Mexico Territory, 6,561; Alabama, 2,576; Florida, 1,290; Louisiana, 8,224; Mississippi, 545; Texas, 1,965, and the Indian nation, 35,030. The troops furnished by the Southern States were, with the exception of those of Louisiana, nearly all white. Florida furnished two regiments of cavalry, Alabama one white regiment, Mississippi one battalion and North Carolina two regiments of cavalry.

A tabular statement has been prepared at the Post Office Department making a comparison between the issue of stamps, stamped envelopes and postal cards for 1878 and 1879. The total value of this year's issues is $29,539,050, an increase of $971,866 over the value of those of last year. The increase in the number of ordinary postage stamps issued is only 4.29 per cent. as compared with an increase of 7.66 per cent for 1878 over 1877. This comparative falling off is due to the effect of the new law for the compensation of postmasters, which, having for its basis the number of stamps cancelled instead of the number sold has put a stop to speculative purchases. There is a decrease in the value and number of newspaper and periodical stamps and stamped envelopes and wrappers. There were 221,807,000 postal cards issued, an increase of more than ten per cent. The increase in the value of sales to the public between the two years is $1,003,218.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 26, 1879.

BEANS AND PEAS.—The demand for beans is mainly for mediums, but the summer trade is never stiff enough to advance prices materially. Marrow dull, with considerable stock in store; estimated 5,500 bbls. In pea or white kidney beans there is no movement. Red kidneys nominal, quotations merely for small parcels. Peas of all kinds quiet with the approach of new crops. Medium beans, prime, $1.32½@1.35; fair to good, $1.25@1.30; marrow, prime, $1.27½@1.30; fair to good, $1.20@1.25; pea, $1.30@1.35; white kidney, $1.25@1.35; red do., $2.25@2.50; black, $2.30. Peas, green, $2@2.10; Southern B. E., per 2 bush. bag, $2.50@2.60; Canadian, in bulk and bond, per bush., 70@72c.

Exports of beans for the week, 313 bbls.; receipts, 1,164 bush. Exports peas, 13,500 do.

BUTTER.—State and Western creamery and fine selected pails and half tubs are higher. Receipts run slow, the falling off in quality incident to hot weather, and as the line of trade that is left to New York wants the best or none, sellers have been enabled to enforce the advance. Ordinary grocery and market buyers have a good offering, but as with State there is a firmer feeling in the upper grades of dairying. Exports continue light, 6,000 taken for week. There is a steadiness of tone to the export trade that is in a degree encouraging. Orders for certain marks that have established a local reputation abroad now receive regular orders. English advices are against large general business for export. Extra June firkins for coastwise export bring 15c. The threatened calamity at the South for a moment makes some pause in that branch of trade.

State pails and half tubs, choice, 14@14½c.; good to prime, 13@13½c.; fair to good, 11@13c.; firkins, yellow, 13@15c.; Welsh, good to choice, 13@14c.; fair, 11@12c.; poor Slate, 8@9c. State creamery, choice, 16½@17c.; good to prime, 15½@16c.; fair to good, 14½@15c.; sweet cream, 16@16½c. Western creamery, choice, 16@16½c.; other, 14@15c.; imitation, 9@12c.; Western dairy, best, 11½@12½c; fair to prime, 9@10c.; factory, choice, 10@10½c.; other, 7@9c.; poor, 6@6½@6c.; grease butter, 4@5c.

Receipts for week, 33,603 packages.

BROOM CORN—Is having a fair sale, and quoted for:

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

COTTON—Has shown a better export demand, and the temper of the market is better; latest prices are for July, 11.78@11.79c.; August, 11.75c.; September, 11.65@11.66c.; October, 10.93@10.93c.; November, 10.61c.; December, 10.60c.; January, 10.61@10.66c; February, 10.76@10.78c; March, 10.90@10.92c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

CHEESE.—The English advices have been tame and the receipts here large, which have unsettled prices. Some sales were made early in the week at 6¾c.; from this the market dropped to 6c., and closed weak at that price.

Prices are for State factory: Fine, 6c.; good to prime 5½@5¾c.; fair to good, 4¾@5½c.; half-skimmed, 4@5c.; skimmed, 2½@3¼c.; State farm dairy: Fine, 5¾@6c.; good to prime, 5@5½c.; fair to good, 4@5c.; skimmed, 2½@3½c. Wisconsin factory: Fine, at 6c.; good to prime, 5@5¾c. Ohio factory: Cheddar, fine, 5½@5¾c.; do., fair to good, 4½@5½c.; full cream, flat, fine, 6c.; flat, good to prime, 4¾@5¾c.; flat, fair to good, 4@4¾c.; half-skimmed, 3@4c.; skimmed, 2½@3c.

Receipts for week, 131,374 boxes.
Exports, 115,000 do.
Liverpool quotation, 33@34s.

DRIED FRUITS.—Apples are in better demand and rule firm in price. Peaches are slow and unchanged. Small fruits are quiet and unchanged; quoted for:

Patent evaporated apples, choice, in cases, at 11c.; do. fair to good at 9@10c.; N. Y. State sliced, choice, at 4@5c.; do, quarters, choice, 4@4½c.; western quarters, bright, at 3½@4c.; common and old at 2@3c.; North Carolina peeled peaches at 9@10c.; Georgia at 8@9c.; do. fair to good at 6@7c.; unpeeled halves at 3@3½c.; do quarters at 2½@3c. Blackberries at 5c. Raspberries at 26@28c. New York State plums at 8@10c. New pitted cherries, wet, at 13½@14c.; dry at 15@15½c.

EGGS.—Receipts for week, 7,695 bbls.; do., last week, 7,210 do. The market is dull even for the summer. A few extra marks of Western have brought 13c. Much of the stock that has sought a market here from other cities is worthless for consumption.

Near points, extra fresh, 15c.; State and Penn., 13½@14c.; Western, best, 12½c.; poor, 11@12c.; Canadian, 12½@13c. Pack invariably in short cut straw.

FLOUR.—Low grades are scarce and wanted, but high grades are plenty and freely offered at weak prices.

Latest prices are: $3.90@4.35 for inferior to very choice superfine State; $4.40@4.65 for poor to good extra do., odd lots and lines; $4.65@4.95 for good to choice do.; $3.85@4.35 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $4.40@4.65 for inferior to good shipping extra do., and $4.65@4.95 for good to choice extra do.; common to choice white wheat extras, $5.10@6.20; choice to fancy do. at $6.10@6.15; red and amber winter wheat, inferior to very choice trade and family, at $4.95@6.35; round hoop Ohio at $4.50@4.85, and trade and family brands of do. at $4.25@6.00, the latter rate for strictly choice; St. Louis, $5.20@6.00 for inferior to good extra; $6.00@6.75 for very good to very choice (with fancy brands held higher); Minnesota clear, inferior to fancy, at $4.35@5.50; Minnesota "straight," very inferior to strictly fancy, $5.00@6.50, and patent poor to very choice at $5.50@8.00 (with a few fancy brands quoted at higher figures); unsound stock at from $2.35@5.25; city mill extra at $5.40@5.75, good to very choice, for West Indies; do. for England, $4.50@4.75; do. trade and family extras, $5.75@6.75; do. for South America, $5.50@5.75 for standard choice brands (winter wheat product); No. 2 at $2.80@3.35 for poor to strictly fancy.

FRESH FRUITS.—Hot weather and a fairly abundant supply keep the market easy as a rule. Peaches begin to look well; Md. supplies have included Troths. Hales will be less abundant this season. So many finer sorts can be had from the further South to supply the early demand, that Hale's fall quite dead on the market, however early they arrive. California pears and plums, $4@4.50 per box, two carloads in market.

Apples, red Astrachan, ₱ bu. crate, $1@1.25; poorer do., in bbls., $1.25@1.75; Harvest, 50@75c. ₱ crate; Sour Bough, N. J., ₱ bbl., $1.50@2; Sweet do., $1.25@1.75; Windfalls, 50@$1. Bell pears, ₱ bbl., $3.50@4; Sugar, $3.50@3.50; Sav. Bartlett, ₱ bush. crate, prime, $3.50@4.50; green, $2@2.50; cooking, $2@3. Currants, cherry, ₱ lb., 8@10c.; black, 5@6c.; red, 6@7c. Whortleberries, per 14 qt. box, $1@1.37. Blackberries, Wilsons, ₱ qt., 6@10c.; Antwerp, Raspberries, 8d, qts., 4@4½c.; do., native, 2@3c.; Brandywine, pints, 4@5c. Watermelons, Geo., per 100, $20@22; Char., $10@18; Norfolk, $12@16.; N. C., $6@12. Nutmeg melons, poor to best, ₱ bbl., $1.50@3.50. Apricots, ₱ qt., 20@30c. Peaches, N. C., common to best, ₱ 3 bush., $1; Md. & Del., Hale's prime, ₱ crate, $1.50@1.75; poor, to fair, 75c.@$1.25. Hot-house grapes, B. Hamburgh and Muscat, 75c.; Sweet Water, 30@40c. Peanuts firmer after an enlarged business, at lower figures early in the week. Va. hand-picked, $1.40@1.45; fancy, $1.27½@1.30; extra prime, $1.25; good to prime, $1.15@1.20; shelled, 5½@5¾c.

GRAIN.—Wheat on speculative manipulation has declined and has not shown much activity for export. Latest prices are of No. 1 white at $1.15; No. 2 do. at $1.12; No. 2 red at $1.11@1.12½; do., July option, at $1.11½@1.12; do. August at $1.11@1.11¾; do. September at $1.11½@1.12; ungraded red at 98c.@$1.10; No. 2 amber at $1.10¾@1.11; ungraded amber at $1.00@1.10¾; No. 2 spring at $1.05@1.07; ungraded spring at 98c.@$1.02; No. 3 spring at 97@99c.; steamer No. 3 spring at 94c.; do. No. 2 red at $1.10¾@1.10¾; ungraded Canada at $1.07 in bond. Corn is easier, with freer supplies: latest sales are of New York No. 2 at 41¾c.; do. for July at 45¾c.; do. August at 45c¾. bid and 45⅝c. asked; do. September at 46c¾.; New York steamer mixed at 44¾@44¾c.; do. for July at 44⅜c. bid and 45c. asked; do. August, 44⅜c. bid and 45c. asked; do. September at 46c. bid and 46⅜c. asked; No. 3 nominal; ungraded Western mixed at 44@45⅜c.; No. 2 white at 52¾@53c., closing latter bid. Oats—mixed stock is plenty and lower, but white grades are favoring sellers; sales of New York No. 1 white at 42c.; New York No. 2 white at 41@41¾c; New York No. 3 white at 39c.; No. 2 at 36¾@37c.; do. for October delivery at 32c.; No. 3 at 35¾c.; unmerchantable at 37c.; mixed Western at 36¾@37c.; white do. at 40@42c.; white State at 41@45c.

HAY AND STRAW.—New hay is arriving more freely and favors buyers. Old hay is in fair demand.

New hay at from 50c. to 70c. Old hay at 40@45c. for shipping and 70@85c. for prime retail qualities. Straw at 45@55c. for long rye, 45c. for short rye, and oat at 30@35c.

Exports since Jan. 1st, 42,020 bales; do. cor. period last year, 40,843 do.

HOPS.—Emmet Wells in his weekly circular says: "Receipts for the week nearly 3,000 bales, yet the cry comes that there are no hopes left back in the country. Exports to London this week, 1,500 bales. Under the influence of continued discouraging news from the English plantations, together with a continuance of rather unfavorable reports from our own districts, both this and the London markets have been quite excited, and prices on choice hops have advanced one cent per lb. above last week's rates, this market closing very strong, with a prospect of a further advance before the week is out. Again we advise growers not to contract their new crop at 15 to 18 cents, as we see by our exchanges some are trying to do."

Quotations are for New York's, new crop, prime choice, 13@14; New York's, new crop, medium, 10@11; New York s, new crop, low to fair, 7@9; Eastern, 8@11; Western, 8@11; Yearlings, 4@7; Olds, all growths, 3@4; Pacific coast, nominal, 10@14.

OIL-CAKE.—Western is quoted $29.00 per ton.

POULTRY AND GAME.—Supplies of live fowls light and good prices ruling; good fat Western do. as well as N. J. chickens are plenty and still quoted easy.

Chickens, large per ₱., 16@17c.; small, 14@15c.. fowls, N. J., 14c.; Western, 13½@14c.; Southern, 13.; roosters, old, 7@8c.; ducks (most of them are too young for market), ₱ pair, 40@75c.; others, 40@60c.; geese, best, $1.37@1.62; others, $1@1.25.

Arrivals of chickens large; they are not doing much better dressed than alive. Fowls in good demand. Turkeys steady for small use

Turkeys, Phila., dry-picked, 12@14c., State and Western, 11@13c.; chickens, Philadelphia, per ₱., 17@23c.; State, 16@18.; Western, 15@16c.; fowls, choice, ₱ ₱., 14@16c.; other, 12@13c.; dry-picked, 15@17c.; ducks, spring, dry-picked, 15@17c.; other, 10@14c.

We do not remember to have ever seen the market so bare of game as it is this week. Woodcock quotable next week.

PROVISIONS—Have been more active and higher. Mess pork quoted for July at $8.90 bid and $9 asked; August at $9; September at $9.15; October at $9.15. Bacon at 5c. for long clear and $5¾c. for short clear. Lard—at $6.05 for spot and July, $6.05 for August, $6.12½ for September, $6.17½ for October. Stearine at 6⅝@6¾c. Beef—Plain mess at $11.25@11.50; extra mess at $11.50@12; packet at $11@11.50; tierced beef, city extra India mess, at $18@20.50; Philadelphia at $17. Beef hams at $20.

TOBACCO.—The export demand is better and there is a good home trade, with prices firm and unchanged.

VEGETABLES.—The local demand cannot use the supplies of potatoes coming freely now, with some export. Sales for the week, to go out, 3,000 bbls. L. I. fair to extra, $1@1.50 per bbl.; culls, 50c. Sweet Potatoes, Va. yellow, $4.50@5. For garden truck the market has an easy tone. Green corn, Hackensack, 50@75c. per 100; L. I. cucumbers, per 100, 40@50c.; do. squash, 50@75c. per bbl.; do. egg plant, $2@3; do. tomatoes, $1 per crate; Phila., 40@50c. per basket; Norfolk, 40@50c. per crate.; marrow squash, $1 per bbl.; String beans, bag, 75c @$1.25; green peas, do., $1@1.50; cabbages, flat Dutch, per 100, $4@6; onions, white, per bbl., $3@3.50; red, 3 yellow Ky., $3@3.25; beets, N. J., per 100 bunches, $1.50@2.50; Russia turnips, per bbl., 75c.; Cauliflower, $1.50@4; okra, per 100, 15@20c.

WOOL.—There is more life to the market and steadier prices.

Sales of XX Ohio fleeces at 40c.; No. 1 and above Ohio at 39½@41c.; medium State at 40c.; do., Penn., at 41c.

Spring Texas at 20@27c.; California at 20@30c.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 26.

BEEVES.—Receipts for the week, 14,063 head; do. last week, 11,315 do. Exports are again large, 3,800 for the week, including live and quarters. Supply rather heavy for summer, and the market closed lower with 25 car loads left unloaded. Dry cows sold at New Jersey at 3½c. live, or 6¼c. to dress 54 lbs. Texas cattle, common to decent grade, quoted 6½@7c., dress 55 lbs. Common to extra native steers, 7@10c., dress 55@57 lbs.; not many at the higher price and few under 7½c.

COWS AND CALVES.—The demand is forced and buyers obtain all they want at an easier range of $25@30 per head.

VEAL CALVES.—It has been a slow market, prices unsettled at the close. Prime to choice Buck's Co. and New Jersey, 5@5¾c., and State 4½@5½c.; poor, 3½@4c.; buttermilk, 2@3c.

SHEEP AND LAMBS.—Receipts for the week, 20,977 head; do. last week, 30,465 do. Export demand for sheep good, especially for heavy fat stock. Some of this class brought 6c., the extreme range for market sheep, $3@5.60 per 100. Fat Tennessee lambs sold at 3½c.; N. J., 6¼c.; other, 5@6c.

HOGS.—Receipts for the week, 13,770 head; do. last week, 20,414 do. There were late sales of Western at $4@4.20 per 100, the latter now extreme for choice corn; State quoted $4.25@4.50 do.; city dressed, hogs, $5.37@5.87 per 100.

Reading for the Young.

A FAILURE."

Brown head and yellow head
Hanging side by side.
Mischief still in lowered eyes
Long lashes cannot hide.

Grimy hands that always
Hold the pencil wrong.
Lips that laugh and whisper,
Whisper all day long.

Hair all ways for Sunday;
Small coat buttonless;
Pockets bulging out with
What—you'd never guess.

Bottles with odd stoppers
Broken patent top,
Jewsharps, green grasshoppers
That never more will hop.

Petrified sweet cookies,
Taffy mixed with string,
A choice full line of peanut shells,
And fifty other things.

Long rows of empty seats.
Sunshine on the door,
Longing looks at windows
And the open door.

Two very naughty boys,
After school is done,
Listening to the catechism
Teacher's just begun.

"Georgie, who's been naughty?"
Here the brown head sinks;
Slowly came the answer
Through the lips, "Frank."

"Frank, you tell who's naughty?"
Hung the yellow head.
"Frank, and tell me truly,"
"Georgie is," he said.

Then the sober teacher
Rules of conduct taught,
About what small boys ought not
And what small boys ought.

After some reflection,
Half an hour's, may be,
To the question "Who is?"
Came two answers, "We."

Proud and glad, the teacher
Sent the twain away.
"Moral suasion, after all,
Is the only way."

At the open window,
Affected nigh to tears,
The teacher stood to watch her
Penitential dears.

Soon they run, quick-fingered
Throwing hats aloft—
Alas for "moral suasion!"
Says Georgie, "Aint she soft?"

[Chicago Times.

GRANDMOTHER'S STORY.

A Thanksgiving Tale.

"Tell us a story, grandmother!" The speaker was one of my four rosy-cheeked cousins, as we crowded around the fire-place one Thanksgiving day.

"What kind of a story shall it be, my dear?" said grandma, as she smoothed the glossy heads at her knee.

"Oh, any kind, it don't matter what; we're so tired of playing," said Joe, speaking for us all.

"Then I will tell you a story of my young days," said grandma softly, and confident that it would be interesting, we nestled up in the corner. I often think of that story now, for grandmother is in heaven with the angels, but the memory of her kind acts and words will always have a fresh place in my mind. "Well, dearies," she began, "when I was a small child, at the time my story commences, mother and I lived in the garret of a great weather-beaten house in Boston. It was a very disagreeable place to live in, for nothing could be seen but dirty stone walls and the roofs of houses. The rooms were dark and frightful passages led to other tenements equally dismal. The eaves of adjoining buildings met with ours and left dark, dirty alleys between. The buildings were five stories high. Yes, dears, it was a hard struggle for bread, and during those trying days of poverty, the money mother earned by sewing hardly paid for the bread we ate, after paying the rent; but God was merciful to us, and in such a way as I shall tell. It was very hard to get sewing to do just then, for there were a great many dressmakers, besides, mother was a stranger in the city whom fortune had cast on rather a hard rock. One day chance put her in a way to do some sewing for a rich lady who lived in the aristocratic part of the town. The material, gray silk, was to be made into a street sacque, which should be very richly embroidered.

"This cost mother many days of hard labor, and when done she very carefully folded it up and bade me go straight to the house of the lady and deliver the parcel. So, bundled in my little shawl and hood, I hugged the bundle in my arms and took my way through the snowy streets.

"It was a crisp cold morning and great puffs of steam rose from all the breweries and factories, as if the buildings were ready to burst with the vapor. When I arrived at the lady's house, and saw the name 'Roberts' on the silver door-plate in great letters, saw the parlors with their golden chandeliers and velvet carpets through the windows, and the great table with its snowy cake and purple wine, waiting for the members of the household to partake of its goodly viands, I felt myself too shy—not good enough—to place my ill-clad feet on the matting made for the rich. Just at that moment the tinkling of music in the room above ceased and a lady, with a soft worsted shawl thrown over her shoulders, looked out of a window. The sweet smile on her face changed to one of scorn as she said, 'It ain't them—only that beggar woman's child with my dress.' I was so faint with cold and hunger and so startled at her rough tones that I could have sunk through the floor had it not been for a servant who harshly relieved me of my burden with the remark to 'clear the path for my betters.'"

"What did you do then?" said Joe.

"I don't know what made me do it, but I sat right down on those marble steps and cried with all my might and main.

"Presently the door opened and a little boy of about my age tripped out of the hall. His name was Henry Roberts, and he was very kind to me, I thought, for he lifted me out of the snow and asked what the matter was.

"I replied that I had had no breakfast and was nearly starved.

"The kind-hearted little fellow then stuffed my pockets full of holiday goodies, placed me on his sled, drew me out of the gate and then bade me good bye. Before I was out of sight of the house little Henry's uncle passed by me. He was very finely dressed, while in his hand he twirled a gold-headed cane. I looked at him again and again, for he kept ahead of me all the way up the street. I was looking at him as he turned the corner, and my thoughts had just returned to mother. I was wishing I might greet her with a merry thanksgiving dinner, when I saw a pocket-book fall from him. I made haste and picked it up, half resolved to keep it, and thus enable my dream of good things to be realized; but, children, you know Granny Roberts wouldn't steal, and so you can easily think of the good spirit which whispered in my heart, 'Do unto others as ye would they should do unto you.'

"I returned it to the rightful owner."

"What did he say," cried Joe breathlessly.

"'God bless you, my child,' that's what he said," answered grandmother, with a mysterious light shining out of her sunken eyes. "Yes, children, God did bless me, too. He sent an angel of mercy to us in a human messenger of His. The gentleman having several hundred dollars in his purse was glad enough to receive it safe and sound. He asked me my name and whereabouts, and on hearing of our distress and actual want, he brought a goodly supply of eatables (among which was a turkey), and went with me to see my mother. He secured a little house in a pleasant part of the city for us, and mother got all of the family sewing to do."

"And what became of that little boy?" said Nellie, nestling up to grandma, who seemed dearer to her than ever.

"Why, he lived and got married," said Tippy, who had heard the story before; "and he married grandma, and he is our dear Grandpa Roberts, right over there in the corner," jumping up and giving him a kiss; "and Grandpa Roberts laughed and tossed us on his knee. He is alive yet, the dear old soul, hearty and hale as ever. He often tells us of the days when he was young and loved grandma."

F. M. A. B.

WHAT BOYS SHOULD BE.

First: Be true—be genuine. No education is worth anything that does not include this. A man had better not know how to read—he had better never learn a letter of the alphabet, and be true and genuine in intention and in action, rather than being learned in all sciences and in all languages, to be at the same time false in heart and counterfeit in life.

Second: Be pure in thought, language—pure in mind and body. An impure man, young or old, poisoning the society where he moves with smutty stories and impure examples, is a moral ulcer, a plague spot, a leper who ought to be treated as were the lepers of old.

Third: Be unselfish. To care for the feelings and comforts of others. To be polite. To be just in all dealings with others. To be generous, noble, and manly.

Fourth: Be self-reliant and self-helpful even from early childhood. To be industrious always, and self-supporting at the earliest proper age. Teach them that all honest work is honorable, and that an idle, useless life of dependence on others is disgraceful.

When a boy has learned these four things, when he has made these ideas a part of his being—however young he may be, however poor, or however rich—he has learned some of the most important things he ought to know when he becomes a man. —*Home Arts.*

LETTERS FROM BOYS AND GIRLS.

Dear Uncle Mark:—You have already so many nieces and nephews that I am afraid you have no room in your great, generous heart for poor little me; but your goodness encourages me. My big sister is a subscriber to the Rural, and I love to read it. I have quite a number of house plants, all my own, and among them is a nice Wax Plant, but it does not bloom. Will you tell me how I can make it bloom? I will not tire you with a longer letter this time, but if you will receive me into the family, I may write again. Your affectionate niece, Theresa Hogan.

Richland Co., Ohio.

[Your plant will thrive best in a soil composed of about three parts of leaf mould to one part of loam from decayed sods, well mixed together, with the addition of some sand and pieces of charcoal, to make it porous. The pot should be well drained and not be too large; a pot about six inches across is suitable for a plant with three to four feet long vines. The vines should be tied to a trellis or led along a post in the greenhouse. It is a tender plant, and as a house plant should, as nearly as possible, receive the treatment required for the well-being of hot-house plants, that is, a moist atmosphere, an even temperature of 60° to 65° during winter, plenty of sun without being burned, and leaves kept clean and fresh. Care should be taken also that it at no time is infested with injurious insects. Do you give your plant such treatment? If not, endeavor to do so, and perhaps it will bloom.—Uncle Mark.]

Dear Uncle Mark:—I am very glad to say that the radishes you sent me came up splendidly, and all goes well with them, only I find, in common with Mr. Butterworth, who mentions it in a recent letter, that there are some little insects that make small holes in the leaves. We have five Grape-vines, but one of them has been badly eaten by some ugly caterpillars. Papa put some Scotch snuff on them and they have now almost entirely disappeared. I have two little sisters, who will soon be large enough to join our club. I am very sorry Uncle True has given up the tour through the "sunny climes" that he contemplated making; I wanted so much to go with him. I notice that a great majority of the letters are from the girls, and between you and me, Uncle Mark, I think, too, that the girls write the nicest letters—some of them are real interesting. How is this, boys, will you allow the girls to carry off the laurels? Dear me, how long my letter is! With many thanks for the radish seed and sweet corn you have sent me, I remain your affectionate niece, Lizzie E. Blair.

Dear Uncle Mark and Cousins:—I wrote a letter for the Rural a few weeks ago, which was published, and so I have concluded to write again. I would like to be a member of the Horticultural Club. I have been quite interested in that society, and wish it to be a success. I have two sisters and two brothers, and each one of us has a flower garden, which we take great interest in, and a great many of our flowers and plants are in bloom now. We also keep two vegetable gardens, which are both looking well at present. I guess that Frizzle-Top means business, to judge by her letter of some time ago, and I hope she will write again. Where is Jumping Jack? I fear he has got the blues and "gone West." I cannot interest the cousins any longer, so I will close with my best wishes for the Y. H. C.

Slayerofconceit's Successor.

Marion Co., Oregon.

Dear Uncle Mark:—I received the radish seed and sweet corn you sent me all right, and I thank you for them. I sowed the radish seed, and it came up very nicely. I have sold eight bunches of them and have given mamma a good many to use. I soaked the sweet corn all day and planted it July 4th. There were 30 kernels of corn, and it is up nice. My premium corn is as good as papa's. I hope I will beat him. I have a patch of melons, and if you will come up I will give you some to eat. I sold five more bunches of radishes to-day. Your little nephew, Jay B. Lampman.

Greene Co., N. Y.

[Since this was written Master Jay has sent me a discouraging account of how a strong wind broke down a portion of his corn.—U. M.]

Dear Uncle Mark and Rural Cousins:—As I do not see any letters from the cousins in this out-of-the-way part of the world, I thought I would let you know that the storms have not blown all the people out of this place yet. I received a package of the sweet corn, and was very glad to get it. I have planted part of it and kept part for next year, should this not grow. I would like to know whether the bee-hive shown in the Rural of July 5th is patented, and how long cheese should be left in the press and when it would be fit for use.

Your nephew, Jayhawker.

Meadow Brook, Kans.

[The hive is not patented. Cheese should remain in the press 36 to 48 hours. It can be used in five or six weeks by those who are fond of new cheese. —Ed.]

Dear Uncle Mark:—This is my second attempt in writing for the Rural. I saw my other letter in print, and I thought I would try again. I love flowers very much. I have a few things in the garden; they are tomatoes, citron, pop-corn, all of which I am going to sell. I have planted some lemon seeds and would like to know if the lemon tree must be grafted to bear fruit? Please enter my name on your Horticultural Club list. I will try and not trouble you too much. Good-bye.

Ingham Co., Mich. Henry Welfare.

[Seedling lemon trees are a long time in getting into bearing, besides, the fruit is not likely to be of much value. The best way is to bud your trees when they are three or four years old. Read what was said about budding last week. Uncle Mark.]

Dear Uncle Mark:—I have been reading the letters from the boys and girls for some time with much interest. I would like to become a member of the Horticultural Club, if you will let me know the charges, but if there are none, please count me as a member. We have taken your paper for almost twenty years, and like it very much. I am twelve years old, and go to school when there is school.

As I am afraid this is getting too long, I will close, hoping that it will not find the way to the waste-basket. Laura Turman.

McLean Co., Ill.

[All who read the Rural are entitled to membership in the Horticultural Club without any charge whatever. But in order to maintain a good standing, members must do good work at gardening, and send occasional reports of what they are doing. [Uncle Mark.]

Dear Uncle Mark:—I have been reading the boys' and girls' letters in the Rural for some time, and as I wish to become a member of the Horticultural Club, I thought I would write and ask you to please put my name on the list. I am a boy 14 years old. My father has taken the Rural ever since I can remember, and before, too. I am very fond of poultry and I have raised 53 chickens this summer, and also some turkeys. I like gardening, also. Well, enough for this time. Wild Tom.

Chelsea, Mich.

Sabbath Reading.

BE STILL.

(*Psalms*, 46—10.)

"Be still, and know that I am God."
The way is dark and wild,
Through which thou goest, my child;
I cannot promise thee a stormless path,
For lightning's scath
And thunder's roar, the pilgrim's journey hath.

"Be still, and know that I am God."
The elements are mine;
It is a hand divine
That quiets the whirlwind in its awful course:
The mystic force
Of hail and tempest find in me their source.

"Be still, and know that I am God."
In danger's hour be ca m;
This is thy secret balm,
To know that thou art safe when I command:
Then only stand,
And see deliverance by my mighty hand.

"Be still, and know that I am God;
Ask not the reason why
I weave such mystery
Through all the warp of thy frail life below;
For thou shalt know,
And need the plan in heavens bright glow.

"Be still, and know that I am God."
Through storms and fears be still:
Only thy part fulfill;
And as thou walkest I will shelter thee;
Thy foes shall flee,
And thou shalt journey all the way with me.

"Be still, and know that I am God."
'Twill be enough for thee,
Safe in my throne with me—
Star-crowned thy head, within thy hand a palm—
To sing thy psalm,
When storms of earth end in eternal calm.

THE DANGERS OF RETURNING PROSPERITY.

The period of financial distress has been sore and long. It has already come to a close. Men of business are not reaping the large profits to which they have been accustomed, but they are prospering, and it is idle to talk about hard times. We need now to anticipate years of plenty, and to fortify ourselves, as best we may, against the temporal and spiritual dangers they will bring. Already speculation begins to abound; and, if we do not err, there is destined to be a fever of gambling in mining and railroad stocks such as we have not known heretofore. Our summer resorts are being again crowded with persons able to lead a life of extravagance and display. The various forms of betting are becoming more popular than ever; and the throngs of people eager to stake money on every horse-race, every base-ball game, every regatta, every walking-match should lead the Christian to redoubled prayers. No careful observer will doubt that many professed followers of the Lord are slipping into customs of the greatest peril. Perhaps at no previous time in the history of the American churches has there been such need to guard our people from the temptation to interest themselves, as spectators, and, alas, that there should be occasion to say it! as betters, at the various sorts of matches that have become so popular. The period of financial depression has been one, on the whole, of spiritual prosperity. Church debts have been paid. Extensive revivals have been granted in all parts of the country. A more serious spirit has taken possession of the people, and extravagance in expenditures, and the army of evils which follow in its train, have been made unfashionable. It is true that many business men have been guilty of dishonorable failures; but their iniquity existed before; and the hard times did but give them an excuse to exhibit it. The same thing may be said of those communicants in the churches who have disgraced their profession by frauds which they could not conceal; their exposure and their expulsion from the brotherhood, painful though they were, have resulted in its purification and strength.

It is natural for us to rejoice at the return of temporal prosperity. Yet it is possible, if we are recreant to our duties as disciples of Christ, that we may live to sigh for the spiritual fervor of the years of temporal adversity. Let us guard better the doors of the church, that unworthy persons may not enter. Let us watch better for the souls of those who profess to follow Christ, that they may not enter into temptations before which they shall succumb. Let us keep our churches free from debt. Let us discourage extravagance in dress, especially on the Sabbath, and in God's house. Let us warn the people faithfully against the perils of betting. Let us strive to keep alive the fires of earnest and simple piety, such as shall thaw out the glittering snows of worldliness which are already falling heavily. The perils of the immediate future are those of prosperity in carnal things, and these dangers are graver and more insidious than any others.—*Watchman.*

HUMILITY.

Christianity does not set men at any work of mere resolution, saying, "Come, now, let us be humble;" that would but multiply the endless specimens of useless self-mortification. But true Christianity puts men face to face with the humbling facts, the great realities of God and His truth, and then humility comes upon the soul as darkness comes on the face of the earth, not because the earth has made up its mind to be dark, but because it has rolled into the great shadow. It is the narrowness of our life that makes us proud. You merchants would be proud of your successful business if you saw nothing beyond it; and you men and women proud of your splendid houses if you looked no further. But if you could only see God forever present in your life, and Jesus dying for your soul, and your soul worth Jesus dying for, and the souls of your brethren precious in His sight, and the whole universe teeming with work for Him, then must come the humility of the Christian. To that humility let us devote ourselves, for in a humility like that alone is peace.—*Phillips Brooks.*

PERSONAL ITEMS.

"I guess the only cure for intemperance is arsenic," wrote James Bly, a Memphis drunkard, before taking a fatal dose of poison.

"My only anxiety on his account is that he is too plucky and go-ahead," is the last sentence in the letter of introduction given by the Duke of Cambridge to the Prince Imperial for Lord Chelmsford.

The arrears of pension law were a godsend to widow Maria Lewis, of Phœnix, New York. All her five sons joined the Union army and all were killed, leaving her to be supported by charity. She has now secured back pensions due her dead boys to the amount of $1,300 and also is guaranteed an annuity of $96.

Charles H. Stilly tramped into Reading, Pa., a few days ago, hungry, ragged and disconsolate. A year before, he had made the people of that city stare at his ways of squandering $20,000 that had been left to him. On the latter visit he begged a meal at the hotel in which he had once occupied the finest apartments, and slept in a barn where he had previously kept his horses.

The London Times' correspondent at Berlin writes: "In England parties rule the Premier, but here the Premier rules parties. Prince Bismarck is in possession of a perpetual majority. The various parliamentary factions are but so many cards in the hand of the Chancellor, from which at will he draws the winning one. The tide of reaction is in full force, and the liberals are fast losing their cohesion and moral courage."

Dr. Cumming, the once popular London preacher who was fond of prophesying the speedy end of the world every now and then, and of all the time showing that the Pope was undoubtedly the Biblical Scarlet Woman, is broken down in mind, body and estate. Twenty-five years ago he drew immense congregations; now an appeal for money to buy him an annuity brings few subscriptions. He is 72 years old.

A woman wanted to remove a tree from her lot in a cemetery at Springfield, Mass., to make room for a monument, but the authorities refused permission. She went home and prayed that the Lord would take the tree away, and within a few hours a tornado blew it over. The same wind did great damage throughout Massachusetts, and killed many persons, yet the woman firmly believes it was sent in answer to her prayer.

Senator Chandler said to a Boston Traveller correspondent: "Many years ago I determined to take a course of training in boxing, and I employed one of the best trainers in the country, the man who trained Heenan for his famous prize fight before the war. I was under this man's charge for at least six months, and in that time became quite an adept in using my fists. I got up a first-class muscle, and have preserved it to this day. No person in the Senate suspects that I am a boxer, or that I can strike a blow of iron, but, if I am ever assailed, my assailant will discover that I can defend myself without resorting to weapons."

Though riches help wonderfully towards happiness, it would seem they don't always secure the article. Adolph Sutro, who gave his name to the famous Nevada tunnel, and is a very rich man, lives in Virginia City, in that State of mines. Recently one Mrs. Allen, a Washington woman, appeared in Virginia City and registered at the leading hotel, where she was spoken of as "the $90,000 widow." After dinner, one day last week, the guests at the hotel were alarmed to hear the screams of women in the elegant apartments occupied by Mrs. A. There was a general rush thither. Mrs. Sutro, Adolph's wife, was found to be pummeling Mrs. Allen over the head with a champagne bottle. The widow was rescued, and Mrs. Sutro, who proclaimed it to the crowd that she was a much-aggrieved woman, turned her attention to Adolph. Mrs. Sutro is said to have instituted proceedings for divorce.

The Oldhams and Belts live in Hardin County, Ill. and rival each other in wickedness. There has long been a feud between the families, and a year ago it broke out into bloody hostilities. A Belt was killed by an Oldham in consequence of a quarrel about a woman, and after that hostilities were open and fierce. Logan Belt, the leader of the Belt faction killed Dorris Oldham soon afterward for revenge. It was not long before Logan Belt's nephew was killed, at a drunken brawl by a man whose wife was an Oldham. The next homicide was that of Doc. Oldham by Logan Belt at an Oldham family party into which some of the Belts intruded in order to force a fight. Although justice is very sleepy in Hardin County four murders within a few months aroused the Grand Jury to action, and Logan Belt was indicted. Several witnesses against Belt have been fired at, one losing a finger; and a badly aimed shot, presumably fired at an Oldham, seriously wounded a Belt, who was standing close by. The trial of Logan Belt has been commenced, and the evidence already shows the existence of a secret society among the Belts, formed for the extermination of the Oldhams.

Quiet nerves and Balmy Sleep in Hop Bitters, for sleepless Ladies and Invalids.

Implements and Machinery.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO., BUCHANAN, MICH.

"Victor" one-horse Grain Drills

(3 and 5 hoed,)
For Sowing Wheat, Rye, Barley, in fallow ground or in standing corn.
Force feed; simply constructed. The five hoed is adjustable for different widths, and is just what every small farmer ought to have, saving the price of a two horse Drill.
Manufactured only by EWALD OVER.

New Publications.

The Voice of Worship,
For Choirs, Conventions and Singing Schools.
BY L. O. EMERSON.

This splendid book is now nearly through the press, and will be in great demand. Full collection of the best Hymn Tunes and Anthems for Choirs, numerous Glees for Social and Class singing, and a good Singing School course. Its attractive contents, with the low price ($1.00 or $9.00 per dozen), should make it the most popular of Church Music Books.

THE TEMPLE. *For Singing Schools, Conventions and Choirs.* By W. O. PERKINS, will be ready in a few days. First class book for Singing Schools, with large collection of Glees, and plenty of Hymn Tunes and Anthems. Price $1.00 or $9.00 per dozen. Although Singing Classes are especially provided for, both the Secular and Sacred Music render it one of the best Convention and Choir Books.

FATINITZA. The new and very favorite opera, is now ready, with words in three languages, all the Music and Libretto complete. Price $2.00 paper. $2.25 boards.

PINAFORE. Price reduced to 50 cts. The same elegant edition heretofore sold for a dollar. Complete Words, Libretto and Music. All ready for the stage.
Any book mailed for retail price.

Wit and Humor.

A LINCOLN anecdote is told by a correspondent of the Decatur Sun. While Judge Logan, of Springfield, Ill., was Lincoln's partner, two farmers, who had a misunderstanding respecting a horse trade, went to law. By mutual consent, the partners in law became antagonists in this case. On the day of the trial, Mr. Logan, having bought a new shirt open in the back, with a huge standing collar, dressed himself in extreme haste, and put on the shirt with the bosom at the back, a linen coat concealing the blunder. He dazed the jury with his knowledge of "horse points," and, as the day was sultry, took off his coat and shimmed up in his shirt sleeves. Lincoln, sitting behind him, took in the situation, and when his turn came, remarked to the jury: "Gentlemen, Mr. Logan has been trying for over an hour to make you believe that he knows more about a horse than these honest old farmers who are witnesses; he has quoted largely from his 'horse doctor,' and now, gentlemen, I submit to you (here he lifted Logan out of his chair and turned him with his back to the jury and the crowd, at the same time flipping up the enormous standing collar), what dependence can you place in his horse knowledge when he has not sense enough to put on his shirt?" The roars of laughter that greeted this exhibition, and the verdict that Lincoln got soon after, gave Logan a permanent prejudice against "bosom shirts."

THIS anecdote is told for a fact by the New York Commercial Advertiser: "Little Sylvester, whose efforts in the "composition" line had previously been confined to dissertations on the "The Horse," and whose bent in orthography has recently advanced into polysyllables. Being anxious to wind up the school session creditably before enjoying his summer vacation he concluded to rise above his rather hackneyed equine tale. Much to the amazement of the schoolm'am as well as to the envy of the small boy at the head of the class, Sylvester presented the following: "Man's mind! how illimitable in its range! With it you can soar aloft on pinioned wings to the very verge of infinity, and through the dim vista of futurity take panoramic views of nonentity!"—He got no further.

HOW HE TOOK HIS SERMONS.—The following is told of Prof. Tholuck: A new student had come to the university, and some time after his arrival he called to see Prof. Tholuck. After a while the Professor asked him where he went to church. "Oh!" said he, "I do not attend preaching. Instead of confining myself to the four walls of a building I go out into the green fields and under the lofty arches of the forest trees. I listen to the singing of the birds and the countless melodies of God's creatures, where everything that hath breath praises the Lord." The Professor allowed him to go on in this strain for a while, and when he had finished he quietly asked him: "But what do you do when it rains?"

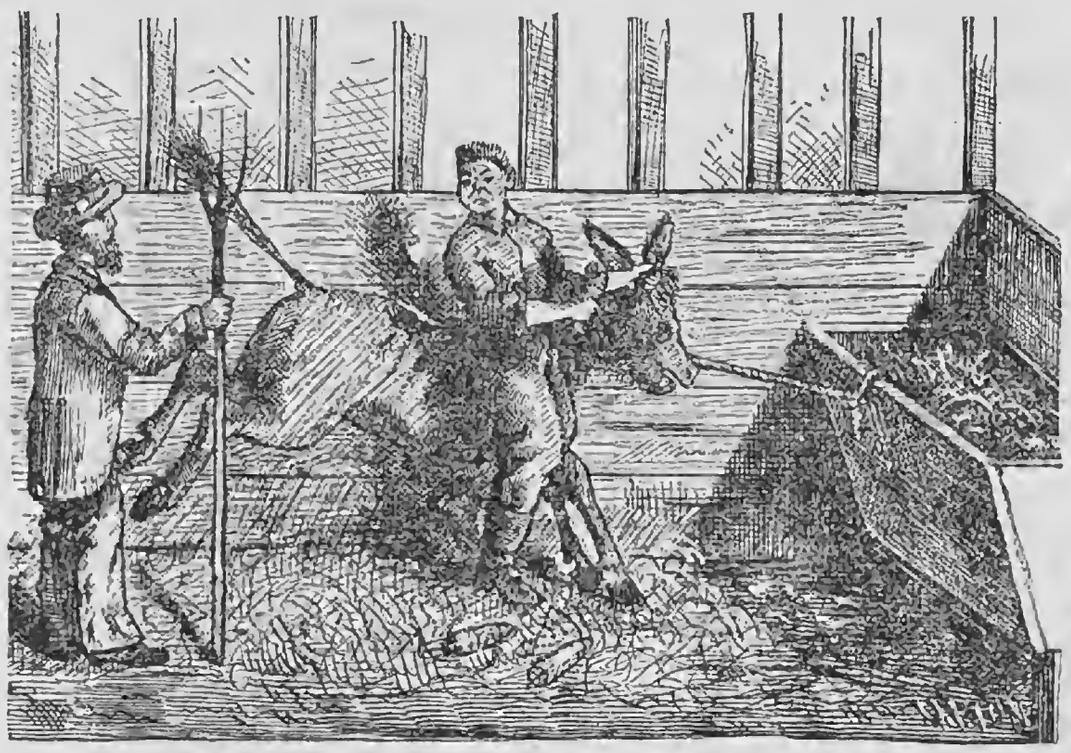
"There is a heavy European hegira this year," remarked an old lady with a compact forehead and a chin more pronounced than ever, since her teeth were all gone. "I wonder what a he gira is, anyhow. He must be something dreadful. I never heard of a she gira; so that shows which sex preponderates in wickedness." "The party of the other part," a mild-eyed rather meek-looking gentleman, who had cherished the lovely creature above quoted as his wife for thirty or forty years, remarked, on reading the same item a few hours later: "A he gira, eh? A gander scrape, I s'pose. No ladies going. Won't they have a blessed time, though?" Such is life.—*American Punch.*

SABBATH SCHOOL CONCERT—Subject: "God's Providence." Teacher—"Why, children, the good Lord cares for even the little sparrows you see hopping about your doors. Can you tell me in what way he cares for them?" "Feeds them," "Tells them how to build their nests," "Gives them wings to fly," are some of the answers given; when all were done, a little mite of a fellow, away in the back part of the room, pipes out, "He divs 'em fedders."

A GREAT deal of poetry has been written about "snow-white sails on a shimmering, sunlit sea," but the sails on most of the craft that we have observed look as if they had been used for circus canvas in a very wet and muddy season. There's no whiteness about them.—*New Haven Register.*

"WHAT are you doing there with that basin of water? Don't you know you'l wet your clean waist?" said his mother. "That's all right," said 6-year-old, as he threw a heifer into the water. "I'm only watching a swimming match."

A RELIGIOUS old lady, when asked her opinion of the organ of a church, the first time she had seen or heard one, said: "It's a very bonny kist fu' o' whistles; but, oh, sirs, it's an awful way o' spending the Sabbath day."



Farmer, to hired man:—What are you trying to do Pat?
Pat, (who has just come over). And sure, sir; ye tould me to feed him corn in the *ears*, but I can't at all, at all!

A CERTAIN colonial legion now extinct possessed at one time an officer who would have well passed for own brother to Mrs. Malaprop. His son became a victim to the tender passion, and while the spooning was at its hottest, S——, "of ours," meets Malaprop pere, and says: "Old fellow, is it true that your son Joe is engaged to Miss Dash? Every one talks so." "It matters but little, Captain S——," replies, Malaprop, pompously, "what people talk. There are always so many canards flying about that it is difficult to believe anything. Whatever I hear I swallow with a dose of salts. Joe is not affianced. Miss Dash has certainly enameled him—completely enameled him. He He has put other shooters horse di combat; but no betrothal is on the tapes. That will come, I suppose, of course; when, I hardly know—but post mortem, I fancy."—*Chambers Journal.*

A SMALL, ragged boy entered an oyster house in Salem, Mass., and asked: "Will you sell me an oyster for a cent? I want it for my sick mother." "What is the matter with your mother?" asked the man, as he proceeded to fill a can with oysters, thinking he would help to relieve a case of suffering. "She's got a black eye," was the reply The benevolence rapidly faded from the mind of the oyster man as he put one oyster in a paper bag.

A YOUNG lover who didn't understand the language of flowers was presented by his adored with a flower of the genus papaver. "Ah," he mused, after a few minutes' contemplation, "she refers me to her popy." But before he called on her again he consulted a floral dictionary, and when he learned that the poppy is the emblem of stupidity he—well, he didn't call on her again.—*Norristown Herald.*

Oh, say, can you see by the dawn's early light
What afflicted us much at the moonlight's last gleaming—
The neighbors' cats mixed in a terrible fight,
And waking us all with their terrible screaming,
The flower-beds bare, the yard covered with hair,
Give proof to the house that the fight was just there.
[Brooklyn Eagle.

SETTLED.—"Landlady," said he, "the coffee is not settled." "No," she replied, "but it comes as near it as your last month's board bill does," and that man never spoke again during the meal.

"MAMMA, is the ridicule very bad to have?" "What do you mean, Georgie?" "Why, mamma, Rosy Green says Dora Dow was exposed to it three weeks ago, and it's high time it broke out!"

IF NOAH had foreseen the future, and killed the two mosquitoes which took refuge in the ark, he would have rendered some of the strongest words in the English language unnecessary.

"PAT, did you ever see so thin a woman as that before?" "Thin?" said the other. "Botherashen! I seen a woman as thin as two of her put together, so I have."

SAID he, as he stole one, "I seal my love with a kiss." And she, suiting the action to the word, replied, "I seal mine with whacks."—*Boston Transcript.*

Malaria Disarmed of Its Terrors.

Malaria, that fell atmospheric poison, is disarmed of its terrors, and health insured to thousands residing where the noxious exhalation periodically infects the air, and engenders intermittent and remittent fevers, by Hostetter's Stomach Bitters, the most popular as it is the best, of preventatives, alteratives and tonics. In numberless localities where the demand for sulphate of quinine was formerly immense, the hurtful alkaloid has been almost entirely supplanted by this safe agreeable and effective substitute, which is genial in action and unobjectionable in flavor. It nullifies the influence of miasma by giving a more active impulse to every vital function, quickening and enriching the blood, overcoming a tendency to biliousness, and promoting digestion.

When a person is weak and faint, or fatigued and exhausted, there is nothing so refreshing and reviving as a little of MURRAY & LANMAN'S FLORIDA WATER. Rubbed on the hands and temples, and inhaled freely, it tones and braces the whole system.

Purify the blood, Cleanse the Stomach and Sweeten the Breath with Hop Bitters.

AWARDED HIGHEST PRIZE AND ONLY

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 32. WHOLE No. 1541. | NEW YORK, AUGUST 9, 1879. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington. — Entered at the Post-Office at New York City, N. Y., as second-class matter.]

Biographical.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, ITS EX-PRESIDENT AND PRESIDENT.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is at once the largest and most influential of the numerous Agricultural Societies of the British Isles. It was founded in 1838 under the name of the English Agricultural Society, and in March 1840, it obtained a Royal Charter of Incorporation "for the general advancement of English Agriculture," while it was declared an essential principle of its constitution that its members should maintain "the strictest exclusion from their councils of the discussion of every question having a political tendency." The prosecution of the following national objects was declared to be the aim of the Society.

"1. To embody such information contained in agricultural publications, and in other scientific works as has been proved by practical experience to be useful to the cultivators of the soil.

"2. To correspond with agricultural, horticultural, and other scientific societies, both at home and abroad and to select from such correspondence all information which, according to the opinion of the Society, may be likely to lead to practical benefit in the cultivation of the soil.

"3. To pay to any occupier of land, or other person who shall undertake, at the request of the Society, to ascertain by any experiment how far such information leads to useful results in practice, a remuneration for any loss that he may incur by so doing.

"4. To encourage men of science in their attention to the improvements of agricultural implements, the construction of farm buildings and cottages, the application of chemistry to the general purposes of agriculture, the destruction of insects injurious to vegetable life, and eradiction of weeds.

"5. To promote the discovery of new varieties of grain and other vegetables useful to man, or for the food of domestic animals.

"6. To collect information with regard to the management of woods, plantations, and fences, and on every other subject connected with rural improvement.

"7. To take measures for the improvement of the education of those who depend upon the cultivation of the soil for their support.

"8. To take measures for improving the veterinary art, as applied to cattle, sheep, and pigs.

"9. At the meetings of the Society in the country, by the distribution of prizes, and by other means, to encourage the best mode of farm cultivation and the breeding of live stock.

"10. To promote the comfort and welfare of laborers, and to encourage the improved management of their cottages and gardens."

Since its incorporation these objects have been diligently carried out by the Society which appropriately chose for its motto "Practice with Science." It has always embraced in its membership all, or nearly all, the distinguished landowners and prominent agriculturists of the country, besides a large number of smaller landowners and tenant-farmers as well as many prominent gentlemen interested in agriculture in Ireland and Scotland. At present its members number 6,634. Its list of presidents, who serve for one year, contains the names of most of the best known landowners and agriculturists in the country during the last forty-one years. Prince Albert occupied the position years ago, and his son, the Prince of Wales, has just closed his second term.

ALBERT EDWARD, PRINCE OF WALES, and heir apparent to the British throne and the Empire of India, is now in his thirty-eighth year, having been born at Buckingham Palace, November 9, 1841. He was married on March 10, 1836 to Alexandra, eldest daughter of Christian IX, King of Denmark, and has quite a large family. He has large estates in Cornwall, also at Sandringham Park, near Windsor, and a little over a year ago was elected to the presidency of the Royal Agricultural Society, an honorary position in which he has been succeeded by the Duke of Bedford.

THE DUKE OF BEDFORD is head of the Russell family, and one of the wealthiest nobles in England. The other day, in view of the grievous agricultural distress prevailing throughout the country, he conceded to his farming tenants a diminution in their rents of £70,000 or $321,600, a sum which, at five per cent interest, is equal to a perpetual annuity of $16,080. Woburn Abbey, his chief country residence, is the finest place in Bedfordshire. The Duke has several other palatial mansions and vast estates in different parts of England, besides large landed property in Ireland. He also owns a large portion of London, and much real estate in other towns, besides a vast amount of miscellaneous property. His family originally acquired most of their wealth from the lavish gifts of Henry VIII, who bestowed on his favorite, the then head of the family, many a rich confiscated abbey with its broad acres. William Russell, born in 1644, was created the first Marquis of Tavistock and Duke of Bedford by William and Mary in 1694. Since then the family have always belonged to the Liberal side in politics, and have produced many distinguished men. The present duke has manifested considerable interest in agriculture and has just been elected to succeed the Prince of Wales as president of the Royal Agricultural Society of England during the current year.

Industrial Societies.

EUROPEAN CORRESPONDENCE.

The Great Agricultural Show at Kilburn.

CATTLE EXHIBITS.

(Continued from last week.)

THE Champion prize for Hereford cows was easily won by Leonora, a beast of splendid proportions, symmetrical form and excellent character, three years old, the property of Mrs. Sarah Edwards, of Leominster, who refused an offer of £500 for the beauty. The same owner also won the first prize for the best calf, Coomassie, a distinction he had previously gained at the Bath and West of England Agricultural Society's fair at Exeter. Many other very fine specimens of the Whitefaces also received prizes or commendation.

Of Devons the show was somewhat small, but it contained many very fine specimens of this handsome breed. In the old bull class the first prize was borne away by Lord Falmouth's Sirloin, who had also been first at Exeter. The same owner also took the first prize in the yearling bull class. Mr. Walter Farthing's Lord Newsham won first prize in the class for bulls over two and under three years old, and also the cup for the best bull of the breed. The same owner's Prettyface was awarded the first prize among cows, much to the discontent of those with whom Mrs. Langdon's beautiful cow, Temptress 8th, found more favor.

Of the Sussex cattle the exhibit numbered 95, an exceptionally large number for this breed, which seems closely allied to the Devons. Few if any of these cattle have been thought worthy of importation into the United States, so that they can attract but little interest there; the judges here, however, warmly commended the cows and yearlings, which found many other admirers also.

The Long-horns, so widely valued in the days of Bakewell, Fowler and Princep, until little over a half a dozen years ago seemed in danger of dying out or of being kept, like the Chillingham cattle, merely as curiosities in gentlemen's parks. Of late, however, a Herd Book of the breed has been established, and an effort is being made by breeding to substitute edible flesh for the mass of fat which the labors of Bakewell and his two successors had piled on beasts of this strain. The collection of them at this show was far greater than has hitherto been seen, and will contribute not a little to increase interest in them. Prince Victor,

THE DUKE OF BEDFORD.

THE PRINCE OF WALES.

owned by Major-General Slr F. W. Fitzwygram, won the first prize for old bulls in this class and also the champion prize for the best male, while the Duke of Buckingham took like prizes in the female class with the Countess of Temple.

The Norfolk and Suffolk Polls numbered only 35, but among them were some very fine beasts. The allied breeds, the Polled Galloway and Polled Angus or Aberdeen, made a very creditable show. Mr. McCombie, whose Polled Angus group won so high a reputation at the Paris Exposition, was not among the exhibitors at Kilburn.

Perhaps the most remarkable feature of this department was the large display of the beautiful, little Jerseys. There were of them 252 entries against 179 of Short-horns. It was by far the largest and finest collection of the breed ever assembled. They came from all parts of England, while Ireland and Scotland sent each its contribution, and the Island which produced them sent across the Channel some of its choicest animals. In the class of bulls over two years old, the first prize was taken by Duke, who has won many prizes on the Island, and is owned by Mr. Le Brun, of St. Ouen, Jersey. The same animal also won the prize for the best male of the breed. The cow class was also headed by an animal from the Island, Mr. Marrett's Zenobia, with golden color, a fine escutcheon, a shapely head, tawny horns and a neat, deer-like form. On the whole, this exhibit attracted more attention from the general public, especially from the female portion of it, than any other in the cattle department.

The very fine but not very numerous display of Ayrshires excited much interest likewise, especially among those with whom a large production of milk is the main excellence in a cow. Mr. Montgomery won the first prizes in both bull classes, and also the first prize in the cow class with Fancy of Dumlanrig, an animal of very handsome appearance, with nice head and horns, and an excellent milker. There was a large number of fierce-looking, massive Welsh cattle also, together with eight little Kerry bulls and 21 cows of the same hardy breed.

Of foreign cattle there was only a miserly show, as the restrictions upon the importation of animals from plague-infected countries was rigidly enforced, and all exhibits from such places were subjected to close quarantine. Even the presence of the few on exhibition caused not a little disquiet to the native stock owners, although they were kept apart from the other animals. This department, therefore, contained only a few bulky Normans and little Bretons, a single massive Holstein bull and a fair number of Danish cattle from Anglen and Jutland. After a view of the splendid native display the foreigners presented few points of attraction.

The Dairy Department

attracted much attention both from agricultural visitors and the general public. The display of butter was one of the finest ever seen here. Indeed, many exhibits appealed so strongly to the good taste of the judges, that they left little or none in some of the packages. France, Belgium, Holland, Denmark, Switzerland and Germany, had all fine exhibits, but the poor show made by the United States was a matter of common comment. The display of cheese, however, did not come up to the expectations of the public or of the judges. The latter ended their report with the remark: "The judges are sorry to have to report that nearly all the exhibits in the classes of English cheese were very inferior in quality—possibly caused in some measure by the early period of the season preventing some of the finest dairies being sent in for competition; and they are of opinion that unless the tenant-farmers who make cheese at home, pay more attention to its manufacture, so as to secure fine quality, they will be forced out of market by the Americans. There is always a ready sale for English cheese at remunerative prices."

The last sentence is equally applicable to the American product, as is amply testified by the stock of it kept by nearly every provision dealer in the country. To describe this interesting department with the amount of detail necessary to benefit RURAL readers, would occupy far more space than could be allowed it, in this hasty outline.

Horses, Etc.

Never before was so fine a collection of agricultural horses assembled in any country. A walk along the sheds in which they were stabled was a journey which few would care to undertake, especially in the wretched condition of roads and footpaths. When paraded in the large ring designed for displaying them, they afforded a truly splendid spectacle. They were divided into three principal classes—the Clydesdales, the Suffolks and those not included under either of these heads. The last was the most numerous, and embraced many of the finest animals of the kind in Great Britain, and consequently on the globe. In this class by far the finest display by any single exhibitor was that made by the Earl of Ellesmere, for whose Worsley immense stud farm the whole country seems to have been ransacked to secure the best animals. Class No. 1, for agricultural stallions, not Clydesdale or Suffolk, over four years old, was headed by his British Wonder. In the three-year-old class he took first and second prizes with young Prince of the Isles and Sampson III. The former had already taken half a dozen cups at other fairs, and was awarded another here as the best stallion on the ground in the classes not Clydesdale or Suffolk. He is a very handsome and symmetrical bay and a splendid walker. Sampson III. has more of the dray-horse character, being a thick-set, short-legged, powerful animal. Again in the two-year old class, the same owner won another victory with Sampson IV., while several other sons of the same, Worsley sire, owned by other parties, were honored with prizes or special mention.

The Clydesdale stallions were much less numerous than what are termed the "shire" horses in contradistinction to them and the Suffolks; still they made a fine show and were great favorites with all those interested in the equine race. Mr. D. Buchanan's Druid not only won the first prize for Clydesdales four years old and upwards, but also the Champion cup for the best male of the breed. He is a very handsome, compact brown horse with short legs and evidently enormous strength. Mr. Martin's The Abbott bore away the first prize in the three-year-old class, and Mr. Montgomery's Prince Imperial, in that for two-year-olds.

The magnificent Cupbearer III. was justly placed at the head of the Suffolk old-class stallions. He is accustomed to take that place wherever he is shown, and won £275 last month at the Suffolk County fair. Here he also won $25 offered for the best stallion of the breed.

There was also a large and very fine array of mares and foals belonging to the three classes. Here Lord Ellesmere again won three prizes, and Mr. Montgomery one. Prizes were also given for the best thoroughbred sire for getting hunters, the best for getting coach horses, and the best pairs of agricultural mares and geldings. Hunters, coach horses, hackneys, ponies, mules and asses, were also well represented. Foreign horses made a much better show than any other class of foreign animals. The Percheron and Boulonnais were very stylish yet powerful; the Normans seemed excellently built for roadsters, while some long-tailed, hardy Belgian horses found many admirers.

Horticultural.

NOTES FROM THE RURAL GROUNDS.

Will Weevil-eaten Peas Grow?

TESTS CONCLUDED.

TEST No. 3.—June 29, 6 P. M. One hundred weevil-eaten peas which had been soaked in water for six hours, were planted in sandy loam three inches deep. They were afterwards watered as needed. The variety was a rather small, early pea. Of these, *three* only germinated.

TEST No. 4.—On the same date as above, twenty-five weevil-eaten peas were planted two-and-a-half inches deep. They had been soaked, as in the above test, for six hours. They were not artificially watered afterwards. More appeared above ground.

TEST No. 5.—Twenty-five weevil-eaten peas, variety "Champion of England" were soaked in water for three hours. This is a large wrinkled pea, and only the best specimens, or those which were the *least* eaten, were selected. They were planted two inches deep in a clayey loam. The ground was moist when they were planted, and it was kept moist afterwards by artificial watering as often as needed. Two seeds germinated. In the same manner near these, in a parallel drill, *twenty-four* peas of the same variety were planted, which were *not* weevil-eaten. Of these thirteen germinated.

It appears from these experiments (all made out-of-doors in garden soil of various sorts) that weevil-eaten peas are substantially worthless. Taken as they come, less than ten per cent. will grow. Our readers may not be convinced by these tests; but we have no prejudices in the matter and they are as trustworthy as we are capable of making them. We are quite at a loss to account for the fact that the impression is general among farmers and gardeners that weevil-eaten peas are just as good as those which are not weevil-eaten. Even such good authorities as our respected contemporary, the Country Gentleman and Professor Riley incline to this opinion, as a published letter of the latter and a commentary of the former upon our first tests, will show.

We have lately examined a number of bags of seed peas offered by seedmen. Some of these were grown in Canada and were entirely free from weevil-grub holes. Samples from other bags showed that as many as one in three had been eaten. The price of seed peas ranges from $8 to $15 per bushel, according to variety. Supposing $5 to be an average price paid for seed peas, and that they were as badly infested as in the last instance above, the buyer would in reality pay $5 for two-thirds of a bushel, plus the ten per cent. of weevil-eaten peas that might germinate. But we have found that of the less than ten per cent. that do germinate, a large proportion will produce feeble plants that will either dwindle away or not bear green peas enough to pay for the ground they occupy. Many of our friends have written to us that we are wrong, and that weevil-eaten peas are as good as any others. One of our contemporaries has stated that we have "discovered a Mare's Nest." We call upon them, as well as upon the Country Gentleman and Professor Riley to show by their own tests wherein ours have been defective, or else for the benefit of the pea-planting community to accept our results as a trustworthy guide.

Roe's Early Ruby.

Mr. E. P. Roe sent us last year six plants each of his new seedling Gooseberries named Early Ruby and Late Emerald, to test. The Early Ruby this summer set its fruit abundantly. When half-grown, we told our readers that at that time there was no appearance of mildew upon either leaves or fruit. Later, however, the fruit became so mildewed that few berries ripened. Mr. Roe, doubtless, has spent much time in producing and propagating the Early Ruby, and we are sorry that it has so badly fulfilled its earlier promise. Our report, it must be borne in mind, is but one of many—the evidence, so to speak, of a single witness—we hope the only one to testify against the Early Ruby. Late Emerald has not yet fruited.

Pure White Double Pelargonium.

Among many plants sent to us for trial by Mr. John Saul, of Washington, D. C., is a double Pelargonium, which, judging from its first blooms, bears a purely white double flower. The first double Pelargoniums said to be white were sent out, as we remember, about five years ago, but they were all more or less rose-color. Many have since been produced and advertised as white, but those which we have seen or tried were scarcely improvements upon the earlier varieties. The Pelargonium under consideration is one of M. Lemoine's productions, and is named Mme. Baltet. The trusses are rather small, but compact; the flowers endure well, the habit is dwarf, the leaves of a palish-green color.

How to Establish Beds of Double Portulaca.

There are no colors that we know of more brilliant than those of Portulaca. Verbena flowers are very bright, but if beds of each exist side by side, the greater brilliancy of the Portulaca will be very strikingly shown. Everybody knows of DOUBLE Portulaca, yet a bed of this alone is seldom seen; and there is a good reason for it—it cannot either be made or maintained without a great deal of trouble. Ten years ago we procured some seed of all colors that produced a large percentage of double flowers. The single and semi-double flowers were cut off or the plants bearing them pulled up as soon as they opened, and this rather tedious daily manipulation we have carefully continued ever since. The result is, our bed is a blaze of white, yellow and red, with all intermediate shades, and the flowers average as large as little Roses. The seed pod from the single flowers contains a hundred seeds or more, while the pod from double flowers is either seedless or contains very few seeds. It will appear, therefore, that a bed of double Portulaca can only be secured by preventing the single flowers from forming and sowing their seeds.

WEEVIL-EATEN PEAS. THE RURAL EXPERIMENTS CONFIRMED.

PROFESSOR W. J. BEAL.

LAST year, 1878, a trusty student at my suggestion, tested some peas with the following results. They are early peas, somewhat mixed, of moderate size and smooth. They were raised the year before. He soaked in water for one day 50 peas which were "buggy" and 50 which were sound, taken from the same lot. They were kept damp for five days when one of the "buggy" peas sprouted and nearly all of the sound ones. Again, in a damp place in the greenhouse, he placed 25 sound and 25 weevil-eaten peas. After six days all the sound ones grew, and only four of the damaged seeds. On June 5th, in good warm soil, 12 sound peas and 25 "buggy" were planted. Of this lot, all the sound ones grew, and only three of the buggy ones. The weevil-eaten seeds produced feeble plants.

This year, 1879, from the same lot of peas 500 weevil-eaten peas were counted out and tested in ten lots of 50 each, in the green-house. By the side of these, 500 apparently sound peas were tried. All of the latter germinated except four.

The following table gives the number which germinated in each lot of 50 of weevil-eaten peas.

1st lot of	50	12	grew.
2nd.	"	10	"
3rd.	"	8	"
4th.	"	12	"
5th.	"	17	"
6th.	"	11	"
7th.	"	12	"
8th.	"	13	"
9th.	"	17	"
10th.	"	13	"
Total grew		130	

This is 26 per cent. Some insist on it that a test in the open air is the only sure and fair one. It may be so, sometimes, but not always, unless very great pains are taken. For example, the moles are often troublesome in our gardens, passing along the rows and taking many of the peas and sometimes nearly all. Perhaps wrinkled or very large peas of some varieties would be less injured by the weevil than those above tested.

Agricultural College, Lansing Mich.

WEEVIL-EATEN PEAS.

THE following questions were asked by one of the editors and answered by Professor Cyrus Thomas:

1.—"Does the weevil eat the pea?" Not to an extent worth noticing, and hence but little attention has been given to this point.

2.—"How long will it live in the pea when it cannot get out?" There must be some imperfection in its oral apparatus, or something unusual in the pea when it cannot get out, and hence I presume it would perish as soon as in any other place of confinement of a similar character. If it can eat the pea to sustain life, it can eat its way out; if it cannot eat, then it must perish for want of food, if food is necessary to its existence. But many insects eat very little in the perfect state, and I am inclined to think the pea-weevil eats comparatively little in that state; but it has a term of existence, beyond which its life will not be much prolonged. I do not believe its existence will, under any circumstances, be prolonged over one winter. As the weevil will often remain in the pea until planted, it may frequently happen that where an individual is unable to escape because of the hardness of the pea, it may accomplish this after it becomes softened in the ground.

3.—"Do they make and deposit eggs on the peas, and then do the young larvæ eat again the old peas?" I do not believe they ever deposit eggs in or on the old peas. The larvæ are adapted only to eating the new or growing peas. The case you suppose is extremely rare, if it ever happens—I do not think it ever does. While it is true that weevil-eaten peas will generally germinate, their vitality is certainly impaired, and their growth I do not think will be so vigorous as when perfect.

RASPBERRIES.

A Note from Mr. Charles Downing.

EDITORS RURAL NEW-YORKER:—You ask for my opinion of the Cuthbert Raspberry, and, in reply, I would state that a longer trial is necessary to give a decided opinion of its merits, but, from what I have seen of it, I think it will prove to be a valuable variety for the market, the berry being quite firm, of good size, and of good quality, while the plant is also a good grower, very productive, and so far apparently hardy. On this point, however, it may vary with seasons, colder and more changeable than we have had since it was introduced.

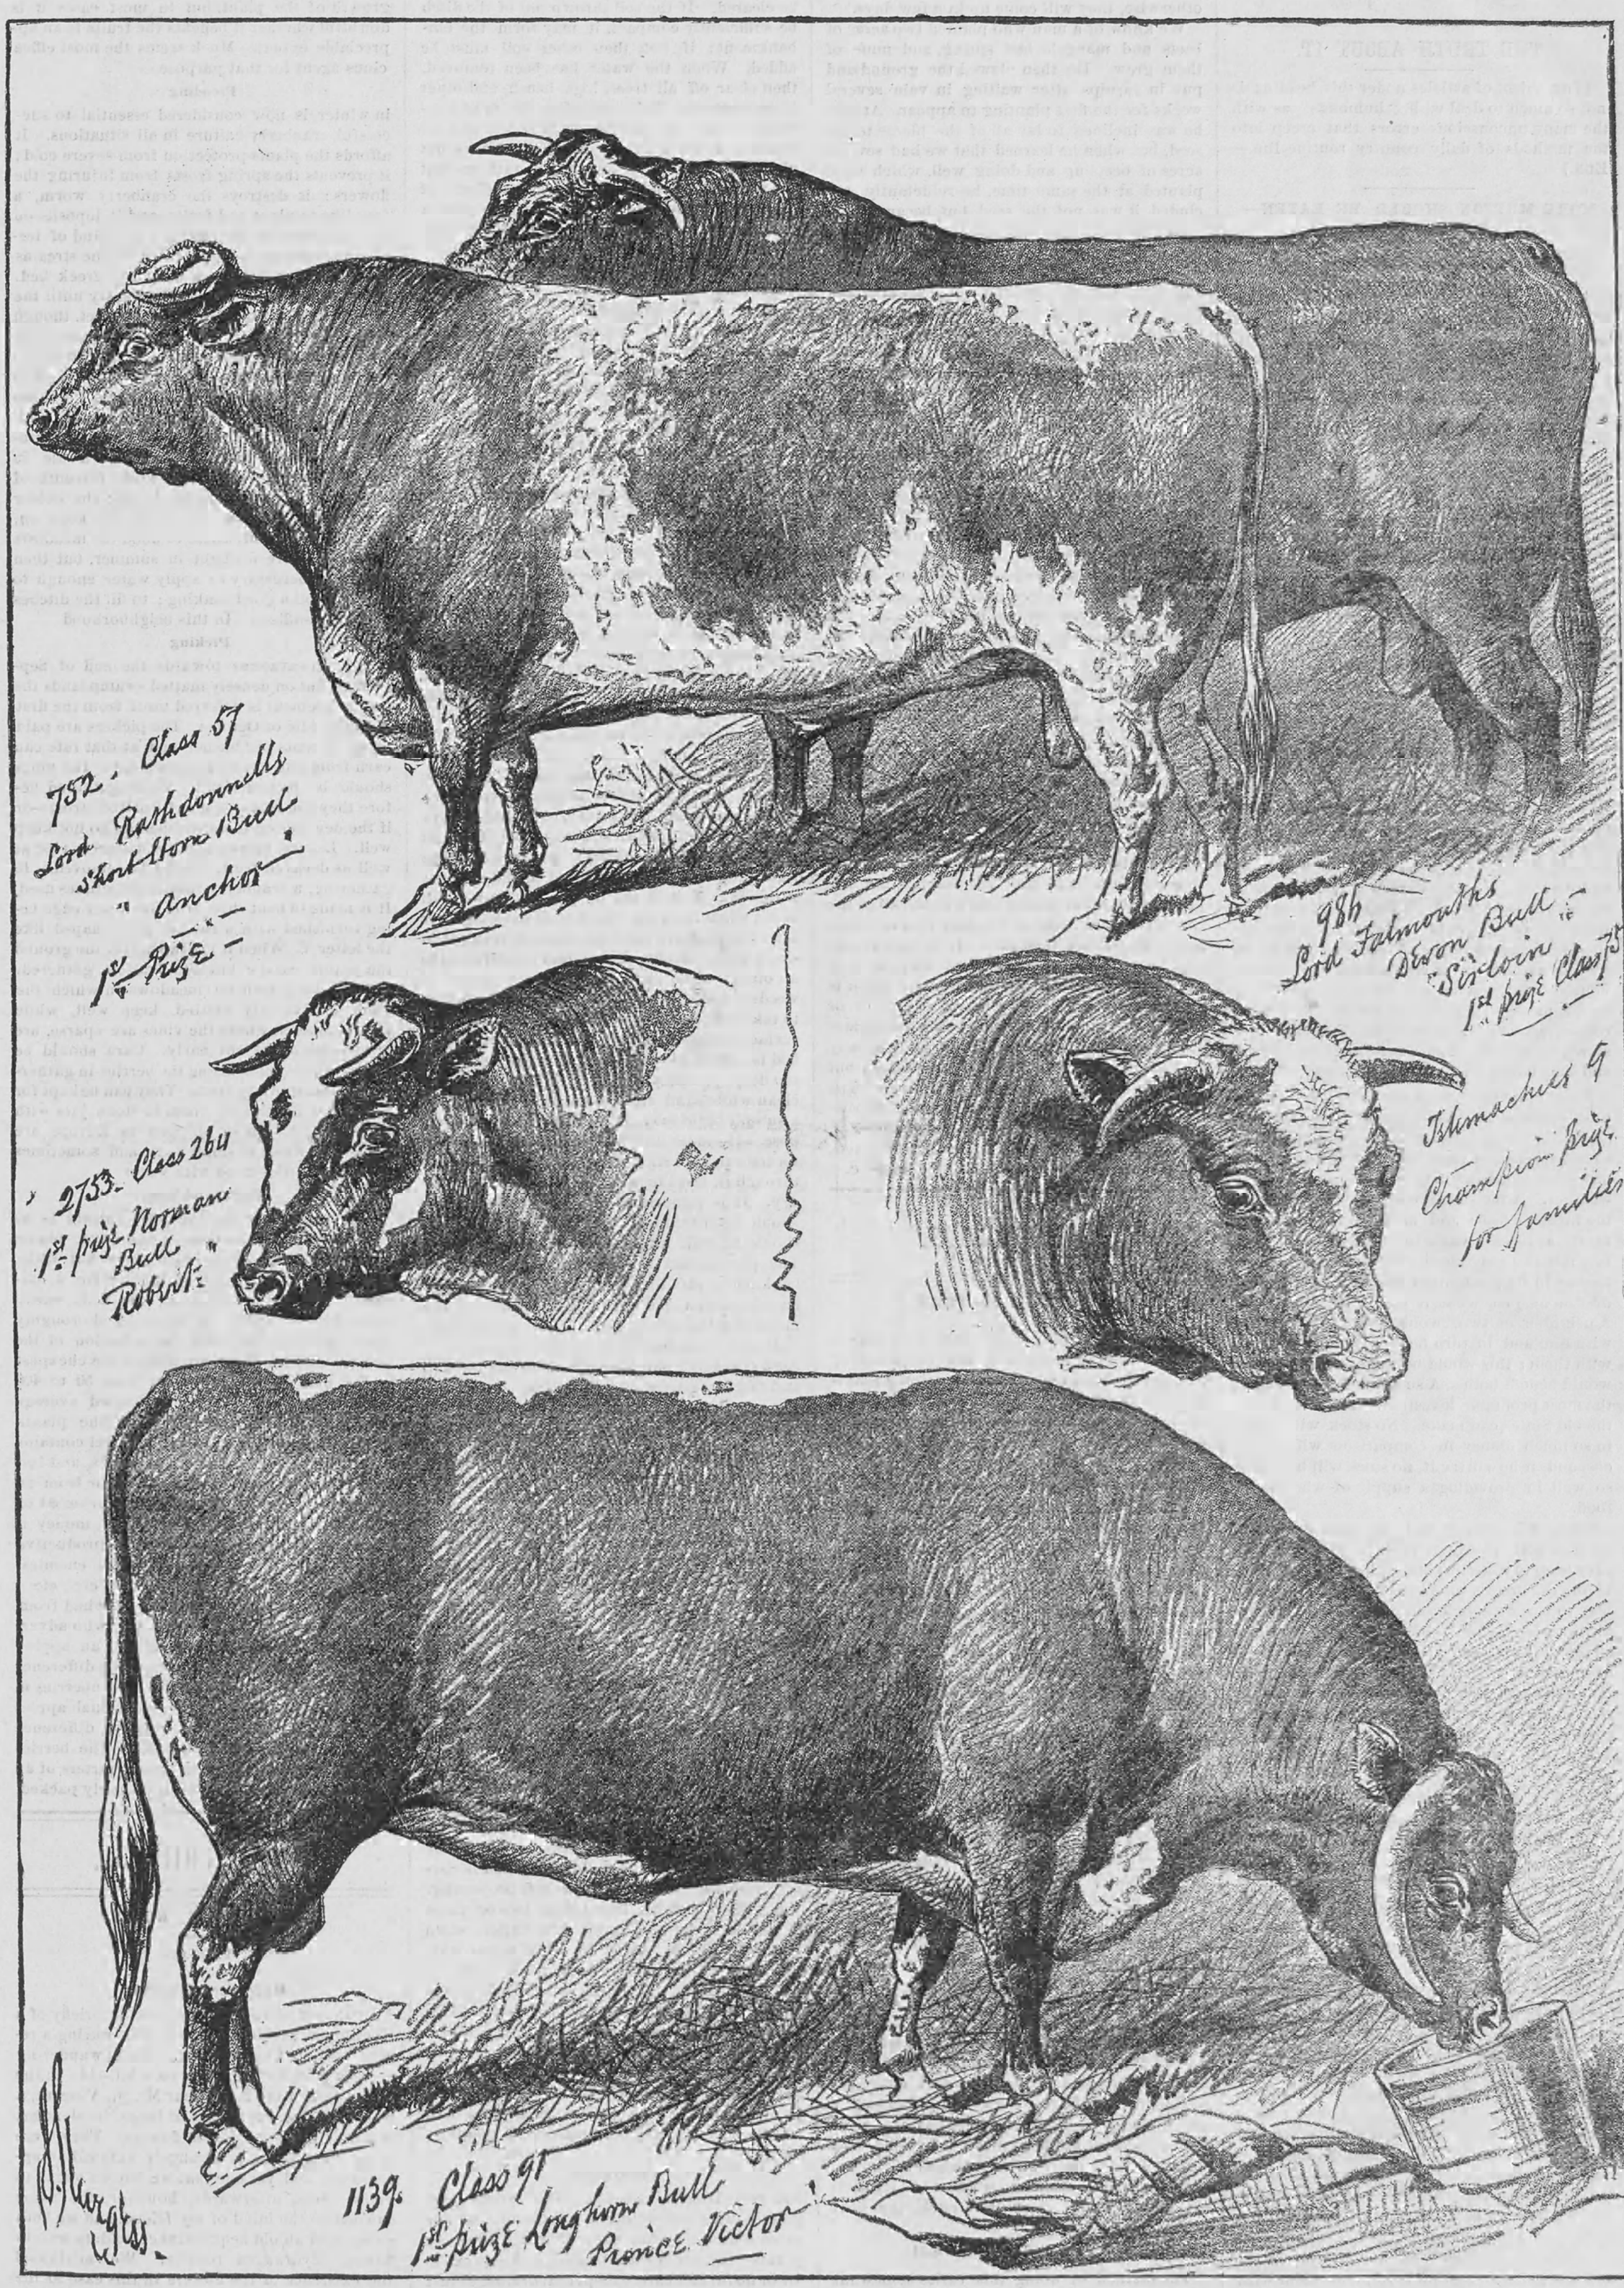
For family use, there is nothing that I have yet seen that is superior to Brinckle's Orange. It is one of the first of its class to ripen, continues longer in use and produces more than any other variety, and the quality is not surpassed, yet many object to it on account of its color—orange yellow. For those who prefer a red berry, the Franconia, Pride of the Hudson and Herstine, are desirable varieties.

CHAS. DOWNING.

[As showing the effect of soil and climate upon different varieties of Raspberries, we may state that Brinckle's Orange with us, though protected, was killed nearly to the ground last winter, while Franconia and Herstine were so harmed as to bear little or no fruit the present season. Cuthbert, as we have twice stated before, has never been injured in the least by heat or cold. The bushes are extremely vigorous and fruitful, and—as our venerable authority intimates—the berries are firm, high-colored and of excellent flavor.

EDS.]

PLANT CELERY; it is so wholesome a vegetable and is so acceptable during the winter season—when fresh vegetables are scarce—that no family should do without it. Get strong plants of some dwarf variety and plant them in rows three feet apart, and six inches between the plants in the rows. Water freely till they are well started. It is now a trifle late to plant them, but in good soil, with good care, a crop for family use may yet be raised.



PRIZE ANIMALS IN THE ROYAL AGRICULTURAL SOCIETY'S INTERNATIONAL EXHIBITION AT KILBURN.

Farm Topics.

THE TRUTH ABOUT IT.

[The object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

MORE MUTTON SHOULD BE EATEN—THE REASONS.

COL. F. D. CURTIS.

A leading butcher in a suburban city informs me that he sold but one sheep during the entire summer; in fact, he only sold a portion of that. After keeping it in his ice-box more than a month, he took it home and ate it in his own family. Notwithstanding the length of time he had it on hand, it was sweet and good, proving that mutton will keep as well as, if not better than, any other meat. During this time he sold thousands of pounds of beef which had been brought on the cars hundreds of miles. In the autumn he sold hundreds of pounds of pork. To us there seems to be a want of wisdom in all this. His patrons refused to eat the cleanest, healthiest and most easily digested meat in the world, and without thought apparently or consideration followed fashion, or habit and ate beef more or less feverish and unhealthy, not knowing or caring where it came from, and pork which might have been reared in filth, and might be reeking with disease. The farmers would be glad to furnish mutton in abundance, if there was only a demand.

It seems to be a universal practice with Americans to dislike mutton, or, at least, to eat scarcely any meat except beef and pork. They will pay twice as much for beef as mutton can be bought for. Chops always sell high, because every one wants them and nobody wants the rest of the carcass. Butchers say that they must sell one-third of the sheep for enough to pay for the whole, as all the rest has to be sold below cost. Americans seem to be totally unused to mutton in any form as corned or salted meat. There is no better meat than corned mutton. It is excellent for soups and stews, or to boil. The hams may be corned and then boiled and eaten cold for any meal.

There is no other meat which the farmer can more economically use while at the same time supplying his table with nutritious and wholesome food, as mutton will keep fresh longer than any other meat and may be safely cured in hot weather. A fat sheep will go a long way at the farmer's table and make twice as many meals as its cash value invested in beef. The beef must be purchased at retail, while the farmer could supply himself with more wholesome mutton at just what it cost him to raise it. A neighbor or two, would share the carcass with him and in turn he could do the same with them; this would be an exchange which would benefit both. A small flock of sheep is the most profitable investment any farmer in the old States can make. No stock will bring in so much money in comparison with their cost and, if he will try it, no stock will help him so well in providing a supply of wholesome food.

Sheep will winter well on straw supplemented with plenty of turnips. These are an easy crop to raise and may be put in any time before the middle of August. This is the best way to work the straw into manure—far better than to throw it into the yard where it cannot be converted into manure at all to be compared in richness to what it would be if fed to the sheep and mixed with their droppings. The straw thrown into the yard, makes a great deal of bulk to handle, with little value. The sooner American farmers begin to raise roots and turnips for sheep, the sooner they will begin to swell the income of the farm by the direct return of more meat made to sell and more manure to make more and better crops.

SUCCESS IN SEED PLANTING.

The Rural has often alluded to the necessity of care in planting seeds of various kinds. Some seeds need to be put into the ground so much deeper than others, that to be successful, requires the exercise of sound judgment, and perhaps thorough practical knowledge. No arbitrary rule will work in all cases, as the circumstances surrounding each case are so different. Seeds will grow well in the hands of some persons because they are planted as they should be, the variations of soil, condition, and wetness or dryness being taken into the account. Small seeds usually require very light covering, while large seeds require deeper planting. This rule has exceptions which experience only will teach. Beet seeds are not very large, and the general custom is to plant them with a seed drill which barely covers them up. When planted in this manner, if the soil should be dry and continue so, they will not germinate; but if planted two inches deep and the soil packed over them either with a hoe or otherwise, they will come up in a few days.

We know of a man who planted two acres of beets and mangels last spring, and none of them grew. He then plowed the ground and put in turnips, after waiting in vain several weeks for the first planting to appear. At first he was inclined to lay all of the blame to the seed, but when he learned that we had several acres of beets up and doing well, which were planted at the same time, he reluctantly concluded it was not the seed, but because they were planted with a drill and not covered deep enough for the dry weather which followed. The successful seeds were covered with a hoe, and where covered deepest, came up first and best. We know of an instance where a choice lot of flower seeds were entrusted to a gardener to plant, who "knew all about flowers," yet none of them were ever seen, except some sweet peas and nasturtiums. The rest were buried so deep that they never came through to the surface. In another case, in a dry time, a man was set to planting corn, and told to step on each hill after covering the seed. He did so over half the field, and neglected to obey orders with the rest. The result was, the portion stepped on came up promptly and yielded well. The other portion did not grow for nearly a month and was a failure. Again, a neighbor spatted every hill of a large field of corn, of clayey soil, planting when the land was somewhat wet, and there was such a solid crust formed on the top of each hill, that the corn could not penetrate through it, and he had to go over the entire lot and break it before the corn could get through.

These examples show that one cannot always follow arbitrary rules, or, in fact, follow blindly any rules at all. Here is where the inexperienced in farming fail. They get the theory and think they are all right, or, they follow some rule and calculate on a positive result, whereas they may meet with failure. Experience is said to be the best teacher, but experience, without taking into consideration the surrounding circumstances, may lead a person astray and cause mistakes. It is just as important to know *when* to plant deep, as it is important sometimes to plant deep; and it is as necessary to know *when* to compress or pack the ground, as it is necessary sometimes to do so. As a rule, the earlier seeds of any sort are put into the ground the better; but this rule has many and vital exceptions. The nature of plants is so different, that to be successful with all, requires a life-long study and experience. It is a field of boundless extent and interest.

F. D. C.

Field Crops.

CRANBERRY CULTURE.

P. W., Seattle, King Co., Wash. Ter., asks 1, how to raise Cranberries; how large a crop can be raised per acre; 2, where can the plants be had; 3, how large is the berry; 4, can the plants be shipped, without injury, from any part of the United States to Washington Territory?

The Proper Location for a Cranberry Bed

is a matter of the highest importance to the prospective cranberry grower. The requisites for successful culture are: a soil of muck or peat that can be drained from 12 to 18 inches below the surface; a supply of water sufficient to allow the meadow to be flooded at will, and an abundance of pure sand close at hand. The profitable sites for a cranberry bed are: swamp lands containing deep deposits of muck; heath ponds, or low basins, places naturally flooded in winter; mill ponds, made available by simply drawing off the water; while savannas, or grounds lying between uplands and swamps and partaking of the nature of the latter, are sometimes turned to good account, but cranberry culture in them is often a risky business. In selecting a location, the presence of other plants often indicates a soil congenial to the growth of the Cranberry. For instance, the growth of the Feather-leaf and Leather-leaf, generally abundant in heath ponds, is considered a sure sign of a proper locality, while the soil that produces the Ground Laurel and Upland Huckleberry is generally too dry. Swamp lands on which the White Cedar, or Juniper, the Maple, Swamp Huckleberry, Magnolia or wild Cranberry thrive, when properly prepared, make lasting and valuable cranberry beds. Although much has been said in support of the practicability of successfully cultivating the Cranberry on alluvial uplands, wherever the experiment has been made, it has never, so far as we have heard, been attended with permanent profit. Having selected a location combining water, sand and muck, the next step is

The Preparation of the Soil,

The method of doing this varies somewhat for the several locations mentioned. The first step in preparing a cranberry bed is usually the digging of a broad, deep ditch entirely around the patch, for the purpose of draining off the surface water, so that the ground can be cleared. If the soil thrown out of the ditch be sufficiently compact, it may form the embankment; if not, then other soil must be added. When the water has been removed, then clear off all trees, logs, brush and other incumbrances. This may often be most conveniently done by the use of the torch, and the fire will not consume only all the briers, but also often a layer of the upper turf, so that the remainder can be more easily handled. If the muck deposit is deep enough, so that a portion of it can be spared, it may be profitably used to manure the neighboring fields. Sometimes, too, this lowering of the bed will facilitate irrigation. A muck deposit a foot in depth is quite sufficient.

Where no muck is removed for manurial purposes, some cultivators pare the ground to the depth of six to 12 inches, and use the sods in constructing the enclosing embankment; while others, where sand is abundant, think it cheaper to spread on a thicker layer of sand, and leave the soil its natural depth. The whole meadow should be made quite level, or with only slope enough to afford good drainage, as one portion should not be covered much deeper than another when flooded. Where the soil is sufficiently firm to admit of being plowed and harrowed, it is best to do so, as it can in this way be prepared in the best and cheapest manner.

When the ground has been properly leveled and otherwise prepared, it should be covered with a layer of pure sand to the depth of from three to eight inches, the depth being regulated mainly by the compact or loose nature of the soil. Too much importance can hardly be attached to the quality of the sand used for this purpose, as many a likely bed has been rendered unproductive by the use of an unfit sort. It should be as free as possible from any admixture of clay and loam, and should always belong to the alluvial and never to the drift formation. The following is a good test of the right kind: Take a handful of it and squeeze it tightly; if it is the proper sort, it will fall apart when released; but if it adheres together after the pressure has been relaxed, reject it in every case. Beach sand should be preferred to all others. The sand prevents the growth of weeds, affords a genial medium for the plants to take root in, keeps the fruit clean and the surface always open and friable. If the muck bed is underlaid with sand and the soil is not too deep, pits may be dug at intervals and the clean white sand from beneath thrown up, or a subsoil plow may be used for the same purpose. If under the bed there is a hard-pan formation, care should be taken not to break through it, lest the meadow should be drained dry. It is important that the layer of sand should be of uniform depth, and so the surface should be well leveled before its application. The plot should be surrounded with an embankment, say four feet high, and ditches enough should be dug to drain all parts of the meadow at least one foot below the surface. Just now is the best time to prepare a swamp for a cranberry patch, as it is drier than usual, and therefore more easily worked. The sanding completed, the next step is

Planting the Vines.

The usual time for doing this is from the first of April to the first of June, although the vine is so exceedingly hardy, that it will bear transplanting considerably later on in the summer. Sometimes the plants are put out late in the fall, the ground being covered with a sufficient depth of water to prevent the freezing and the throwing out of plants; but these appear to have no advantage over those set out in the following spring. It is of great importance that the plants should be obtained from fruitful beds as well as those that produce the largest and best fruit. The best way to distinguish the right kind is by the wiry texture of the wood and the greenish-brown color of the leaves. The poorer plants are more vigorous, greener, brighter and have a more bushy foliage than the best. Cranberries can be propagated by transferring the sods which bear the vines, or, better still, by cuttings from four to six inches long; the middle of which is covered with the soil and the ends left projecting. Vines have been cut into pieces two or three inches long by a common hay cutter, sown broadcast and harrowed in. The better way, however, is to plant them from eighteen inches to three feet apart, according to the quality and size of the plants; or two or three cuttings may be planted together with a dibble. There are several methods of planting, such as hill planting, drill planting, planting by pressure, and, rarely, propagation by seeds, the object being in all cases to cover the ground with the vines as soon and conveniently as possible. As to

Cultivation,

but very little is needed. The weeds and grasses must be kept down for the first two or three seasons, by the close of which time the plants will have become matted, and require little or no further care, except that drainage must be kept perfect within at least twelve inches of the surface, except when flooded, as anything like stagnant water is fatal to the Cranberry. A small application of guano, ashes, lime, marl or stable manure tends to produce a robuster growth of the plant, but in most cases it is doubtful whether it benefits the fruits to an appreciable extent. Muck seems the most efficacious agent for that purpose.

Flooding

in winter is now considered essential to successful cranberry culture in all situations. It affords the plants protection from severe cold; it prevents the spring frosts from injuring the flowers; it destroys the cranberry worm, a foe alike to plant and fruits, and it deposits on the bed a wealth of just the right kind of fertilizing elements brought down by the streams from field, garden, dung heap and creek bed. Many do not think flooding necessary until the third year after the plants have been set, though others deem it profitable from the first. The time for applying the water will vary in different localities, but it is a safe rule to let it on so soon as the cold stops vegetation and the vines begin to assume a dull-red appearance. All winter it should be kept deep enough to prevent the plants from freezing. As a rule, in this latitude, from the first to the fifteenth of May is early enough to let it off; the colder the season, the later it should be kept on. Sometimes it is advisable to flood the meadows during a severe drought in summer, but then it is only necessary to apply water enough to give the soil a good soaking; to fill the ditches generally suffices. In this neighborhood

Picking

begins on savannas towards the end of September, but on densely matted swamp lands the commencement is deferred until from the first to the middle of October. The pickers are paid about 50 cents per bushel and at that rate can earn from one to two dollars a day. The vines should be picked clean. When gathered before they are ripe—to save them from frost—or if the dew lies on them, the berries do not keep well. Leaves, straws and prematurely ripe as well as decayed fruit, should be removed. In gathering, a cranberry rake is sometimes used. It is made of bent sheet-iron, its lower edge being furnished with a row of teeth shaped like the letter V. When it is drawn over the ground the plants escape but the fruit is gathered. Cranberries grown on meadows on which the vines are thickly matted, keep well, while those gathered where the vines are sparse, are apt to soften and rot early. Care should be taken to prevent bruising the berries in gathering or transporting them. They can be kept for family use by placing them in stone jars with pure water. Those shipped to Europe are packed in water in small kegs, and sometimes in sealed bottles filled with water.

Profit and Loss.

The chief outlay in cranberry culture is at the outset; when once productive plants are well matted, their care costs but little, while they bring in a good income for a lifetime. The cost of preparing the beds varies from $100 to $600 per acre. A thoroughly good preparation, and the selection of the best varieties of vines, are always the cheapest in the end. The yield varies from 50 to 400 bushels per acre, with an estimated average crop of about 150 bushels, when the plants have begun to bear well. A barrel contains about two bushels and three pecks, and last fall sold here, on a weak market, for from $6 to $8 for the Cape Cod berries, and from $4 to $7 for those from New Jersey. Much money is often lost by the setting out of unproductive beds, and by the ravages of insect enemies, frosts, scalding from excessive heat, etc., etc.

2. Cuttings, plants or seeds can be had from any of the many fruit nurserymen who advertise in the Rural. 3. How large is an apple? There is, proportionately, as great a difference in size between the individual cranberries in each variety as between the individual apples of each sort, and as great a relative difference between the different varieties. The berries vary from three-eighths to three-quarters of an inch in diameter. 4. Yes, if properly packed.

Arboricultural.

EVERY-DAY NOTES.

S. PARSONS.

Hydrangea Rosalba.

I cannot refrain from speaking briefly of a Hydrangea accidentally met with during a recent visit to Central Park. While wandering about a wild rock garden on a hill-side in the upper part of the Park, near Mt. St. Vincent, a friend pointed out a mass of large, resplendent corymbs of rosy-crimson flowers. They were borne by a plant of strangely unfamiliar appearance, and yet one that we felt we ought to know. Soon afterwards, however, the name dawned on the mind of my friend, and we both recognized an old acquaintance seldom seen in flower, Hydrangea rosalba. We attributed the existence of the flowers in this case to the very sheltered, dry position the plant occupied. Thus favored, the wood had fully ripened, and consequently passed through a severe winter

unscathed. The bloom also had developed with peculiar excellence under the favoring peculiarities of the place. Few in this climate ever see the flowers of Hydrangea rosalba at all, blighted as it is by ordinary winters. The existence of this plant, however, in the spot where we found it, suggested to us the feasibility of having more of its kind in bloom, if we would only select like positions for its growth.

Magnolia Thurberii.

I fear a hardy Japanese Magnolia that has been termed M. Thurberii, must give up this cognomen for that of M. Kobus. It bloomed this year for the first time with us, and the peculiarities both of the appearance of its flower and time of flowering, agree very closely with the description given of M. Kobus by Mr. Maximowicz and others.

Acer polymorphum.

Query: Shall we term the many-formed Japanese Maples polymorphum or palmatum? There are authorities for both specific names, and they are used interchangeably. I believe they should all be termed polymorphum or all palmatum, and that the question is only to be settled by discovering which name was employed first by competent authorities. I could make a shrewd guess that palmatum was the original name, but facts are wanted. Thunberg seems to have used the name palmatum many years ago, according to Loudon, and doubtless it will be necessary to go back more than fifty years to settle the question, new as many fancy these Japanese Maples to be.

The Adornment of Cemetery Lots.

One of the most beautiful sentiments offered at the shrine of departed relatives and friends, is that which keeps beautiful with leaves and flowers the quiet abodes of the dead. It would be well, however, if more taste and knowledge of the habits of plants went with the active devotion of this character often evinced. If the fence monstrosity could be done away with altogether, our cemeteries would be greatly improved; but if the fence must remain, above all things do not crowd the lot with stiff hedges of Arbor-vitæ and other large-growing plants. Let an irregular, graceful fringe, or belt, of dwarf evergreen or deciduous shrubs mask the fence with varying outline and somewhat formal repetition, as befits the dignity and regularity of the place. Inside should grow scarcely anything but greensward, with low-growing vines and flowers wandering about with modest freedom. If here and there a shrub is used, it should be of the rarest mold and dwarfest form; choice bits of arboreal sculpture rather than mere foliage and flowers. The taste exhibited in the ornamentation of burial lots, cannot be too severe, chaste and refined. Flowers we may have, but they must grow and bloom within limits, and the colors and forms of evergreen and deciduous trees for both summer and winter landscape, must blend deftly and harmoniously, lest anything *bizarre* mar the peaceful nature of the spot. And, in addition to all this, let me say that in no species of lawn planting does the importance of intelligent pruning, fertilizing and watering, apply with such force as in that pertaining to God's Acre.

Miscellaneous.

DESTROY THE WEEDS BEFORE THEY SEED.

At this season of the year farmers are generally crowded with field work and unless great care is exercised, many things about the farm will be neglected. There are few more repulsive sights about a farm, than a garden overgrown with tall noxious weeds. It is a matter of economy as well as neatness that these weeds be destroyed before they mature their seeds and they become scattered over the ground. One weed allowed to go to seed at this season, will make a great many weeds next year, and it is clearly to be seen that unless care is taken to prevent it, a little negligence now will cause much trouble another year. A few hours each week spent in the garden with cultivator and hoe, will be sufficient to prevent this evil and the time, taken at odd spells when there is little else to be done, will hardly be missed. It is not practicable to entirely exterminate the weeds from a garden, but if a little care is exercised in preventing them from going to seed, a great deal will be done in that direction. A well managed kitchen garden, will help greatly to reduce the current expenses of a family, but at this season of the year it must not be neglected or the weeds will soon become the chief occupants of the soil. A quarter of an acre of garden as some are managed, will grow more weeds than ten acres of farm land. Fence corners are also apt to be neglected. When a crop of grass or grain has been removed from a field, the fences and fence corners should be mowed out with a scythe. This will add greatly to the appearance of a farm and many weeds will be prevented from scattering their seeds to adjacent fields and farms. G. G. JR.

WHAT OTHERS SAY.

Doing Things Too Well.—In the gardening of our "little village" of Germantown, says the Telegraph of that city, we often see the evil of doing things too well. A person buys a pretty place, but he believes in doing things well and he spends hundreds of dollars in "beautifying," only to spoil what was already near to perfection. We saw in one case some gardeners laying sod. Every piece was measured and squared with a knife, and fitted into one another. We inquired why all this trouble, and were told that the operator believed in doing things well. In this very instance there was a piece of sodding laid next door, in which the pieces were laid tolerably near, and rough pieces stuffed into the cracks, and then the whole beaten with a flat heavy board, and though the other job cost probably two hundred dollars more, no one could see any difference after the thing was done. We have come to look on the slow and sure way of doing things as pretty much of a humbug in most cases of gardening and farming. It may be very well as a rule in money-making and in morals. We believe in it there; but in work it is one of the meanest of all mean things. Every idle fellow preaches it. Laziness grows fat on it. Empirics and pretenders practice on it. Give us an average go-a-head fellow, even at the risk of breaking the harness or springing a bolt sometimes. The tortoise may beat the hare in the race once in a while, as Mr. Æsop told us; but we will wager our editorial quill that it won't happen every day.

Sowing Seeds and Nuts.—Mary Wager-Fisher tells the N. Y. Tribune that three years ago, having some choice seeds and nuts that she wished to grow without fail, she proceeded to treat them according to the very approved method one often sees advanced in journals—to put aside the seeds, etc., in sand during the winter and plant in the ground in the spring. The result was, that not one of the seeds or nuts germinated. Last fall she again had seeds of a large variety of fruits, including grapes; also several varieties of nuts. And one day—to be accurate, it was the 15th of November—she had a bed spaded up for her purpose, and in it she tossed the seeds and nuts, duly labelling each kind, and sprinkled a bit of earth over them. A few days later a slight layer of straw from the stables was added. The result of this planting is a complete success. Everything grew.

An Easily-made Filter.—Gardening Illustrated (England) says: Take a common garden flower-pot, nine inches in diameter and ten inches deep. The drainage hole must be stopped (not too tightly) with a piece of clean sponge. A layer of about two inches of animal charcoal is first placed in the pot, then a second layer of clean sand, upon which a layer of three inches of clean coarse gravel is placed. The pot can be set over an earthen jar, into which an abundant supply of pure water will filter for all drinking purposes.

Tuberous-Rooted Begonias.—The English Gardeners' Chronicle says: "For many reasons, good ones too, Tuberous Begonias are becoming fashionable. Their beauty, distinctness, hardiness, readiness of propagation—except in certain instances—may be mentioned as some among the many reasons why this race of plants is gaining more and more in popular estimation."

Entomological.

COLLECTION AND PRESERVATION OF INSECTS.—No. 1.

PROFESSOR A. J. COOK.

Very much of the improvement in the practical arts during these last few years has been due to close and accurate observation. Without this all experimentation is of little or no value. To it science, the greatest blessing ever received by the practical man, owes its very existence. Few persons realize how much the world owes to the great Bacon for founding the inductive system of philosophy. Yet the very foundation of this system is observation. It has been said that Franklin would see more in crossing the English Channel than most men would in making the entire circuit of the globe. How significant this fact in consideration of Franklin's great and valuable discoveries in science! Mayer, of Germany, noticed the rank growth of clover growing along the pathway where the stone-cutters in the gypsum quarries passed daily to and from their work. This observation gave to the world one of its most valuable fertilizers. One of the most successful farmers and wheat-growers of Michigan told me that in growing his pioneer crop of wheat he observed limited areas all over the field where the wheat was much heavier. He also observed that each of these places was the site of a tree previously blown down by the wind, which brought up the heavier sub-soil. He then learned to plow deep. His less thriving neighbors have lived by his side for forty years and have yet to make this practical observation. How many of the intelligent pomologists of Michigan have in their mind's eye an accurate photograph of a single one of the thieving insects that are working so successfully to pilfer from them their choice fruits? Who can doubt but that an accurate knowledge of these facts, based, as it must be, on a quick and well-trained observation, would do much to fortify our fruit-growers against these pests of the garden and orchard?

I hope in these papers, by explaining the requisites and methods necessary for preparing insect cabinets, to induce some of those who read them to engage in the pleasant and valuable pastime of making collections, or if not that, of encouraging their children to do so. Such recreation will prove most healthy and valuable for the young, and if practiced, will raise up a body of trained observers that will be able to do far more valuable work, as they take our places as farmers and pomologists, than we have done.

When and Where to Collect.

The entomological collector need wait for no time or season. In winter and at midnight, no less than in summer and at noonday, his quest, if guided by intelligence, is sure to be rewarded. Many beetles lie concealed in winter beneath leaves; others, together with bugs, moths, chrysalids and eggs, quietly wait under log, board, stone or rubbish for the warm spring time. Cocoons and egg clusters hang pendant from branch and shrub, or are snugly hid away in crevice and nook. In winter, too, we find leisure to study, label and arrange the previous year's collections. In spring, from the earliest warmth, when "first the lone butterfly flits on the wing," when the streams are crowded with the swift-swimming larvæ of the lace-wings or day-flies, and when the little frail lace-wings even dart to and fro above the snow drifts, on to the steady warmth of early summer, when air and sunshine are alive with insect life, we revisit with greater success the places that rewarded our search in winter, and further stroll along barren sand drifts, sweep with our nets the grass and bushes along the meadow and roadside, jar bush and shrub above our open umbrellas, to capture the small but often rare and beautiful beetles, and the rich and wondrously varied caterpillars and other larvæ, attractive prophecies of still more attractive moths and butterflies. We visit the bright and sweetly-scented flowers of gardens, fields and woodland—for insects have an eye, and a nose, too, for just such flowers—where we are sure to secure the brightest gems of insect life. The resplendent moths and butterflies, and the glistening, metallic beetles, bees, wasps and flies are sure to reward our visits to these, nature's fairy-lands, made doubly so by the very fairy-like creatures which we are so eagerly seeking. As the warm nights of summer come on, the collector visits the previously sugared boards hid among the foliage, and is made joyous by the capture of our beautiful noctuids or night-flying moths, which are not only the gems of night, but as truly of the collector's cabinet. Nor have we to stop here, for with dredge-net we may repair to the pool, stream or morass in successful quest of the strange larvæ and pupæ of the dragon-flies and other neuroptera, and the boat-like beetles and bugs, while the maggots of our mosquitoes, and many other of our most curious diptera, will also be added to our collection. If perchance we take a row-boat to bear us over the waters of any of our great lakes, we can gather up from the surface of the water many rare weevils and other beetles that have been blown over the water, and, too tired to fly longer, have given themselves up to the waves. On resinous buds and viscid leaves we may also find insects; around carrion and all various kinds of filth, from the ordure of our stables and the various kinds of decaying organic matter to mushrooms and other fungi, as well as about the oozing sap from wounded trees, we can hardly ever look in vain for insects, and often from the most repellant and disgusting matter we obtain the rarest and most beautiful specimens. Sometimes the collector makes rare captures in the stomachs of insectivorous birds. Such additions are none the less welcome, though taken at second hand. In the various grains and fruits that are attacked by insects, and also in the solid trunks of trees and in the numerous galls so widely scattered on herb, shrub and tree, are to be found insects as varied and curious as the locations harboring them. In all the places last mentioned the insects may be taken in their various stages, may be reared and studied, and to the careful and attentive student will furnish information, not only new to himself, but often, very often, new to science.

Industrial Implements.

THE NEW BUCKEYE DRILL.

P. P. Mast & Co., Springfield, Ohio, have made such sweeping alterations and improvements in their grain drill as practically to have constructed an entirely new implement. The principal feature is the new arrangement of the force-feed, which we illustrate, showing the cups as they sow (1) wheat and (2) oats. The toothed disc is made to revolve in the seed-cup on a positive-motion shaft, which insures accurate work. The device for varying the quantity of seed to be sown (without change of gears) is in the shape of a feed-regulating gate

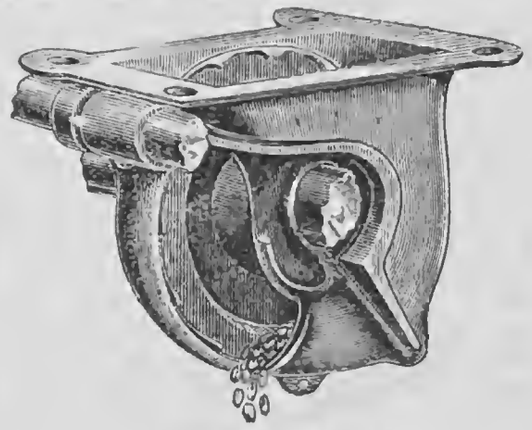

Fig. 1. Sowing Wheat.

which slides back and forth in a slot in the side of the feed-cup. The grain passage is by this means intersected at any desired width, and the seed consequently sown in large or small quantities. At the same time the action of the tooth-disc makes the discharge (large or small) with perfect regularity. The feed gates are all connected on one shaft, which connects with an indicator placed at the rear of the grain hopper, near the right-hand end, where it is in easy reach of the driver. The indicator points over a scale suitably marked for different kinds of seed, so that in operation, a slight motion of the indicator points, instantly changes the gauge and feed in every cup on the drill; and it can be done without stopping the work. This advantage is very manifest where the soil in the same field differs greatly, and when a

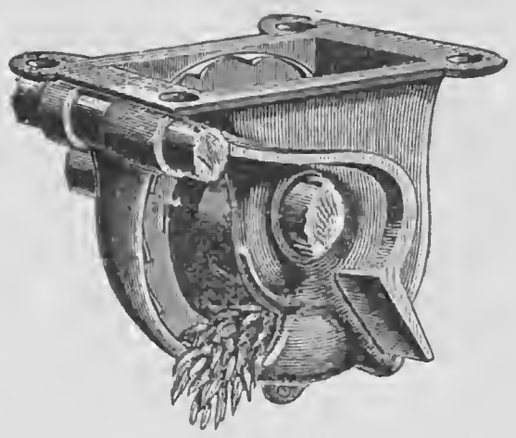

Fig. 2. Sowing Oats.

smaller quantity of seed will answer for one part than for another. A grass seed sower, constructed on the same principle, but reduced in size, is also a new feature that has proved a success in practice. It can be used either in front or rear of the grain-hopper at will.

Among the minor improvements are a new land measurer, placed at the end of the hopper, which accurately measures acres and fractions of acres sown, automatically—something entirely out of the common in implements of this kind. The hoes are raised by pressing down a vertical lever, making the act an easy one on the muscles. A notched quadrant into which the lever can be set, makes it also possible for the driver to raise the hoes entirely or only part way, and to keep them rigid in the desired position. There is also a new hoe shifter. These improvements, in addition to the fertilizer attachments of which we gave an account last fall, make the new Buckeye drill a very complete implement, and one it is manifestly to the advantage of progressive farmers to examine. Pamphlets and illustrations of the new features will be sent gratuitously on application to the manufacturers.

Mr. E. B. Huntley, the European representative of the Johnston Harvester Co., sends us from his London office a bulletin, showing the prizes secured in France by the new light mower which has just been introduced on the other side. It reads somewhat like a triumphal progress, and leaves no room for doubt that this latest product of the company has clearly walked into the affections of our Gallic neighbors. Mr. Huntley has hung up in his London wigwam eleven prizes and one diploma of honor as tokens of his prowess in the fields of Troyes, Nevers, Brest, Charly Sur Marne, Saint Richaumont, Cruzy, Ancy le Franc, Sens, Cheroy and Melle.

Everywhere.

RURAL SPECIAL REPORTS.

N. Y., Elmira, Chemung Co., July 28.—Farmers here have been very busy for the past two weeks. The harvest of wheat and barley, together with haying, has made the hours for rest few and far between. The weather has been favorable, and early-cut grain has generally been housed in good condition, but many late crops of both wheat and barley have been caught out in the recent rains and somewhat injured. Haying in this locality is about finished. The crop, as a general thing, is a light one, owing to the cool, dry weather in the early part of the season. Wheat and barley are only fair, and the yield per acre will doubtless average less than usual. The potato crop promises well, much less damage being inflicted by the beetles than last year. Corn, favored by recent rains, is growing rapidly and bids fair to be a good crop. There is a general complaint among tobacco growers that the crop is not growing as it should. A few pieces are doing well, but others, even on good soil and with the best of care, are growing very slowly. This is probably owing to the lack of rain and warm weather which the "weed" requires to make a good growth.

G. G., JR.

N. Y., Fluvanna, Chautauqua Co., July 25.—Crops of all kinds are looking fine; potatoes especially. A. C. W.

IND., Croydon, Harrison Co., July 23.—Wheat is very good in quality; the yield is about two-thirds of last year's crop. Corn and potatoes will be light, owing to continued drought, with the exception of a few local rains here and there in the county. Oats and grass are almost failures. Apples are half a crop; peaches, an entire failure; small fruits scarce. Trade and business are reasonably good. Farmers are preparing to sow a large crop of fall wheat.

C. M.

MICH., Palmyra, Lenawee Co., July 24.—Owing to the severe drought in this section I have lately felt somewhat discouraged about my chances for a premium for the best yield of Blunt's Prolific corn, but my prospects are now brighter, for on the 21st and 22d we had plenty of rain, so I must still be kept among the luckiest of the competitors for the liberal prizes offered. The corn is thoroughly worthy of its name, Prolific, with the biggest kind of a P., so far as its growth is concerned. I have just measured one stalk that was 6¾ inches in circumference, six inches above the ground, but as yet there isn't a sign of an ear. Pearl Millet isn't worthy of its name: it's a failure with me. H. T.

WIS., Salem, Kenosha Co., July 25.—Crops good generally. The chinch bugs, however, are doing some damage. D. L. B.

MINN., Le Seur, Le Seur Co., July 24.—We are in the midst of the wheat harvest. Croakers to the contrary notwithstanding, we have not had so good a crop in this section of the country for six years. The yield will be large and the quality good. The weather is glorious, quite cool and pleasant for the time of year. I measured my "Blunt's corn" yesterday in the presence of several citizens; hight, thirteen feet and five inches. It is just beginning to tassel, and the ears—four to five on a stalk—are forming. When fully grown I expect to see it fully sixteen feet high. I am not competing for the prize or prizes. I planted the Beauty of Hebron potatoes after taking off all the sprouts I could. From the two potatoes and the sprouts I have raised a bushel and a peck of good eatable potatoes. I planted the Early Rose at the same time and I must confess that I can see no difference between the two. I could not tell the potatoes apart and could see no difference either in the time of maturing or in the size and flavor of the tubers. Is the Defiance wheat a *hybrid?* If it is, from what species? [Yes, it is a hybrid of the common Club Wheat, and a fine, white sort from the Pacific Coast.—EDS.] Permit me to object to the use of the term "variety" as applied to various plants in the RURAL. For instance, a "new variety of grapes," a "new variety of corn," etc., etc. A "genus" is a class embracing many species; a "species" is a class subordinate to a genus; a "variety" is a varied assortment, subordinate to a species; a "kind" is a race or sort. If I say I have a new variety of Strawberry, I mean that I have got a varied assortment. If I say that I have a new kind, or sort of Strawberry, I think I hit the nail on the head; but perhaps I am wrong. I shall continue to take and read the RURAL in any case. G. D. S.

[Sort, kind and variety are used synonymously. Our friend only needs to look into any botanical work, or even into Webster's Unabridged, to see that he is mistaken.—EDS.]

OREGON, Tangent, Linn Co., July 24.—The RURAL may wish to know how we have succeeded in growing the seeds it sent us. I believe that we have succeeded first-rate, beyond our most sanguine hopes. To enumerate; we have 48 of the Rose of Sharon; 18 Aquilegia; 10 Yucca filamentosa; 18 Hollyhocks; 12 Hibiscus; 6 Amorpha fruticosa; 5 Callicarpa. They are all growing thriftily. We have seven nice hills of the Beauty of Hebron potato. Blunts' corn is growing very well, but there is only one of the prizes that we can have any hopes of competing for, and that is for the heaviest bushel of corn. I really do believe that our cool summers produce heavier grain than can be raised anywhere else in the United States. Our crops are looking better than they have done for a number of years. R. L. S.

OREGON, Chesher, Lane Co., July 14.—The prospects here for a bountiful harvest were never better. In this country the arable acreage is much larger than last year, and we have the finest promise ever known in this county for wheat and oats. Potatoes are looking fine, too. There is plenty of new ones in market, and of good size. Hay is a heavy crop. Corn does not thrive here as a general thing—the nights are too cool. Strawberries were mostly killed by frost. Blackberries, both tame and wild, are plentiful. We have an abundance of apples and pears, as well as some plums, but very few peaches. Harvest begins here about the first of August. E. B. B.

WASH. TER., Coupville, Island Co., July 23. The wheat crop looks very promising; but there is not a great deal of it sown. Potatoes are very thrifty. Oats and barley look fine. No corn is raised here—it is too cold. Grass and all forage look thrifty. The whole spring was wet and cold. W. J.

N. C., Brookston, Warren Co., July 25.—The fine rain mentioned in my last report, proved to be of only ninety minutes' duration, and was soon swallowed up by the thirsty earth and now we are, as it were, completely dried up. All crops are suffering severely; corn is rolled up; cotton is losing its foliage; tobacco is at a standstill; grass and clover are nowhere. Grapes are maturing rapidly. We must have rain soon or else "good-bye" to our corn crop, and if that fails us, we shall be sadly crippled; it is the chief food for both man and beast. Melons are among our greatest luxuries—early, very small; later, none setting. M. B. P.

VA., Alexandria, Essex Co., July 24.—An unusual drought is now prevailing in the tide-water counties of this State. Mill-streams are dry and so are pastures, and stock water is scarce. Fields and gardens are suffering severely from lack of rain; and farmers are very anxious. OBSERVER.

ALA., Sand-Spring, Limestone Co., July 24.—We have had very dry weather for the past five weeks, and much of our corn is so "fired up" that it will be worthless. If it doesn't rain soon, cotton, too, will suffer badly. W. M.

CANADA, Columbus, Ont., July 25.—As a general thing crops are in a fine condition. Spring wheat was badly damaged by the weevil. W. D. B.

The Querist.

ANSWERS TO CORRESPONDENTS

Top-dressing for Meadow Land.

W. M. N., Darien, Conn., asks which of the various chemical fertilizers would be best as a top-dressing for meadow land.

ANS.—Stable manure will last longer than any of the concentrated fertilizers. As a matter of guess-work we should choose bone flour. We should like our friend to lay off several equal plots upon his meadow—they need not be over 33 feet square, 1-40 of an acre—and upon each to sow a different fertilizer. For example, let him procure fifty pounds of bones, burn and mash or grind them to a powder. This would furnish phosphoric acid. Then for another, he might use unleached wood ashes for potash. For a third he might buy 25 lbs of sulphate of ammonia. For a fourth bone flour which would furnish both nitrogen and phosphoric acid, and so on as far as he desired to experiment. We have faith that the results of such experiments would afford some clue as to which fertilizing ingredient his land stands most in need of at present.

To Remove Warts from a Cow's Teat.

J. T. R., Bay City, Mich., asks what will remove a wart from a cow's teat.

ANS.—Apply caustic potash two or three times a week, and it will soon disappear. Or, tie a silk thread tightly around its base, so as nearly to cut into it and stop the circulation, and it will come off in a couple of days. This may be impracticable when the wart is broad and flat, or crowded by others; in which case it may be removed by cutting it off and touching the cut with a hot iron to stop the flow of blood, or by applying very strong pyroligneous acid to the wound. Lunar caustic in a strong solution is also recommended.

Miscellaneous.

T. M., Pembroke, Ont., Can., asks, 1. what do manufacturers of pianos, organs and melodious mean by guaranteeing their instruments for five years; and how long should such instruments last with constant but good usage; 2, whether there is any means of changing the color of sprouting whiskers from dark red to a light color and of coaxing them to grow naturally of the nicer shade afterwards; 3, whether the electric belts advertised are of any use in curing disease; 4, who publishes the best edition of Scotch songs with music; 5, what is the best kind of soil for Geraniums in pots and how can the leaves be prevented from withering and turning yellow, as his are doing now; 6, is Pearl Millet likely to prove a good forage plant in that section; 7, which would be the best breed of cattle for that part of Canada; 8, a neighboring hen lately laid an egg having another perfect egg inside of it, and the cause of the phenomenon is asked.

ANS.—1. A manufacturer's guarantee is an engagement that with proper care and use, the piano or other instrument will retain, for the period mentioned, all the qualities that make it desirable; and that should it fail to do so he will put it in good order or replace it. Where the purchaser lives near the seller or, in some cases, near an agent of his, such a guarantee may be carried out; but in most cases it merely amounts to an assurance that the instrument is well and substantially built. If so constructed, then with ordinarily good care, a piano or organ, in what is called constant use, should last fully five or six years and with less frequent use, a longer period—*provided* it is periodically tuned. 2. We have never heard of any such preparation. The daily use of a razor has a tendency to produce the desired hirsute effect. 3. The Pulvermacher belts are reported by those who have used them, to have a beneficial effect; otherwise we would not feel justified in allowing the advertisment to stand in our pages. 4. Of C. H. Ditson & Co., 843 Broadway, this city; in boards $2.50; cloth, $3; cloth gilt, $4. 5. Geraniums will do well in a mixture of one part of leaf mold, two parts of loam from decayed sods, with a little manure and some sand. This is best if the plants are inteuded to bloom; if they are simply to be wintered for bedding plants next year, they should be set in small pots and have a very light soil without manure. Some leaves will always fade away and die on the lower part of the stem, but if they all turn yellow, the plants are not receiving the right treatment; 6. The farther South this plant is cultivated the better the accounts of it, although many good accounts of it are given by growers as far north as this latitude and even farther. We have no reason, however, for the belief that it will prove a good forage plant as far north as Canada. 7. Which is the best breed of cattle for that section will depend mainly on the object for which they are kept. The Ayrshire is very hardy, gives a large mess of milk and cannot easily be beaten in such a climate either for the milkman or the dairy. For a butter cow the Jersey is a great favorite, but it may be doubtful whether the climate is not too severe for her, but we hear of good results from Jerseys and especially from Jersey grades, nearly as far north in New England. If given a rich pasture, the Holstein is excellent for milk, butter or cheese, and at the same time she fattens well whenever it is desirable to turn her over to the butcher. The praises of the Short-horn, both for the butcher and the dairy, have been sung too often to leave anything unsaid in their praise; while for beef it is no easy matter to get ahead of the Hereford. Before advising judiciously in such a matter, we should be told more about the circumstances. 8. Such freaks of nature occur occasionally, but we have never seen any satisfactory reason assigned for them, and we haven't room here for conjectures.

V. A. W. Fredericktown, Ohio, has several Spanish coins bearing dates from 1776 to 1825, and asks whether they possess any special value.

ANS.—The value of old coins, like that of most articles of trade, depends wholly on the proportion the supply bears to the demand. Very old coins have an intrinsic worth beyond that of the bullion in them, as they help to determine historical questions and are mementos of the progress of the arts in their days: but those of a date so modern as that of these, can in no case have more than a "fancy" value beyond their circulating or bullion worth. Now the "fancy" price of an article depends on the taste or whim of the purchaser, and as we are unacquainted with any possible purchaser for these coins, we really cannot tell what he might be induced to pay for them.

A. C., Shrub Oak, N. Y., has considerble space in the garden in which nothing has as yet been planted and, being desirous to raise a crop on the ground, he asks what can yet be planted and become of use before fall; if it is too late to sow bush beans and peas.

ANS.—Quite a number of vegetables may yet be planted in that part of the country. It is not too late for bush beans and peas. Strong celery plants may yet be set out, if done at once. Late cabbage, cauliflower and kale may also be set out and seeds may be sown of lettuce, turnips, radishes, spinach and endive. It is now also a good time to set out strawberry plants.

J. F. C., Los Pinos, New Mexico, asks whether hand cultivators like that described in RURAL for July 12, will be manufactured, where and at what price.

ANS.—We have no reason to suppose that cultivators like the one mentioned will be manufactured, unless individuals wish to make them for their own use. It is not patented, and the teeth, which are the main feature of claimed excellence, can be made by any blacksmith. In fact, the teeth may be attached to any hand cultivator and we suppose the same results achieved as if the whole implement were manufactured.

E. S., Grand Island, Neb., sends us a specimen of a variety of wheat which, during the last three years has been spreading rapidly among his wheat crop, despite the fact that he has in that time never found a head that had filled, and he asks what is the probable cause

ANS.—No doubt seed will be found in some of the heads. As it tillers so remarkably, an occasional seed in a head would account for its increase.

C. A. S., Tamarac, Pa., sends some ears of wheat for name. Several years ago a neighbor found one stalk growing in a stump, saved and sowed the grain, and this year has raised four acres of it. Thereabouts it is called "Stump" wheat. It yields well, the berry is large, and if it is a new variety, he thinks it will prove a valuable acquisition.

ANS.—We do not know it. It is a fine-looking grain.

A. C., Placer Co., Cal., wants to know how much we would charge for Sharpless, Forest Rose and Pioneer, and asks if we could send them by mail.

ANS.—Ellwanger & Barry, Rochester, N. Y.; F. R. Pierson, Tarrytown, N. Y.; J. T. Lovett, Little Silver, N. J.; E. P. Roe, Cornwall-on-Hudson, N. Y., P. M. Auger, Middlefield, Ct., can furnish them and send by mail. We do not *sell* plants or seeds.

G. T. G., White Store, asks where he can get some rattlesnake oil and the price per ounce.

ANS.—Rattlesnake oil is a preparation from the fat of the rattlesnake and can be had of Lheu & Fink, 160 William St., N. Y., or in any other wholesale or large retail drug store; price 50 cents an ounce.

S. B. P. (no address) sends us a frond of a Fern, and asks for its name.

ANS.—Adiantum pedatum—Maiden's Hair. This handsome Fern is a native of our shady woods. It surpasses many of our cultivated species in beauty, and is well worthy of cultivation. It is especially adapted to shady rockeries.

F. C. L., Hermon, N. Y., sends a sample of a plant which he found growing among his wheat. It was four feet high and one of 26 which grew from a single seed, and he asks its name.

ANS.—It is Bromus secalinus—Cheat or Chess.

D. D. K., Bethel, Conn., says that at the American Institute Fair, in this city, an elevator was exhibited suitable for raising or lowering from five to ten cwt., 20 feet, and he wishes to know the parties who exhibited it.

ANS.—Otis Bros. & Co., 346 Broadway, N. Y.

The Poultry Yard.

A REMEDY FOR GAPES.—In answer to a recent inquiry in the RURAL for a cure for this pest of the poultry house, L. P. J., of Bethlehem, Conn., says: "I know there are innumerable so-called remedies for this malady, and I have tried a great many of them, besides giving my fowls a different course of feeding each year, and yet all my early chickens died. At length an old uncle—a prosperous farmer—told me to just take my coops out into the orchard or meadow, entirely away from the house; to place each coop under a tree, mowing the grass where necessary. I did so, and even the chicks that were affected with the gapes speedily recovered, and I have not lost one since then. I was so glad at having found a cure for gapes at last, that I have given this as another remedy for gapes in chickens in the hope that others also may share my satisfaction."

PREVENTIVE AND REMEDY FOR GAPES.—I keep a few chickens which are never troubled with gapes, and this I attribute to a change of roosters every spring. I use old barrels for coops, thus keeping the chicks off the ground at night. For feed they have wheat screenings and cracked corn with plenty of clean water. Several of my neighbors think the above precautions too troublesome, and I've not the least doubt but that each of them loses nine out of every twelve of his chickens. My sister is quite a fancier of poultry and exchanges eggs with neighbors; but she has been troubled somewhat with gapes. She cures the ailment, however, by bathing the afflicted bird's throat well with kerosene. This I offer for the benefit of M. S. who, in a late RURAL, told of the trouble he has had with gapes. T.

SATURDAY, AUG. 9, 1879.

AGRICULTURAL DEPRESSION IN ENGLAND.

THE present agricultural distress in the British Isles is the chief topic of discussion not only among landowners and tenant-farmers, whom it affects most intimately, but also in Parliament, the public press and among the entire intelligent community. Every week the subject is anxiously ventilated in agricultural meetings throughout the country; acrimonious debates have taken place in the House of Commons concerning it; a Royal Commission has lately been appointed to investigate its cause and devise some remedy; a measure providing for the appointment of a Minister of Agriculture with a seat in the Cabinet, has been adopted by a large majority of the Commons, despite the opposition of the Government; the newspapers and agricultural journals are full, every issue, of lengthy reports of the speeches of various notabilities on the matter, as well as with editorial amplifications, suggestions and lucubrations; while wherever in public or private the educated classes congregate, the agricultural outlook is as common a theme of conversation as the state of the weather, the news from Zululand or the latest sensation.

Nor is the universal interest manifested in the question without ample cause. At no time in the modern history of the kingdom have the owners and occupiers of the land been so greviously harrassed as at present. Five unfavorable seasons in succession have not only cut short the profits of the tenant-farmers, but in most cases inflicted a money loss upon them. The evils which, under the most favorable circumstances, must naturally result from so many consecutive poor harvests, have been disastrously increased by competion with the cheap products of foreign nations, especially with those of this country. From these two causes combined it is estimated that the loss incurred by the agricultural community during the last season alone, has not been less than £58,000,000, or $280,720,000. Should the causes that have produced this state of affairs continue, it requires no gift of prophecy to foretell the speedy ruin of British agriculture. Nor are the tenant-farmers the only sufferers; for the landlords also have, as a rule, had their incomes curtailed by necessary reductions in rent, by the numerous bankruptcies of their tenants, by greatly increased poor-rates, and because, in many cases, as it has been impossible for them to let their farms, they have been forced to manage the land themselves at a much smaller profit than that usually returned by the skill, labor and capital of those who hired it from them. Moreover, manufacturers and the vast multitude employed by them have also suffered more or less severely from the distress among the farmers. The agricultural industry forms the chief element in the home market, which, in the United Kingdom, is eight times as valuable as the export trade, and the embarrassment in this industry has necessarily augmented the depression in manufacture and commerce, which now affects our transatlantic cousins. One-third of the capital of the country is engaged in its agriculture; certainly for three, and probably for five years, this third has been nearly unproductive, and the whole nation must suffer from the comparative unprofitableness of so much of its resources.

But the short crops due to unfavorable seasons, and the low prices necessitated by close competition with cheap products, are accidental causes of the present distress. There are others, however, that lie in the very nature of some of the national institutions. The former causes may be obviated in future by a change in the weather and a change in the tariff; the latter can be removed only by the abrogation of the land laws, which means a social and political revolution; for it is the existence of these laws, that for ages has kept social distinction and the government of the country in the hands of the landowners. Their repeal therefore would, in time, work a mighty revolution in English society and in the form of English government. But as the English people have an exaggerated estimate of the excellence of their social and political conditions, as they are thoroughly conservative in regard to social and political matters, and as these laws have the sanction of time-honored usage and the support of vested interests, it is safe to predict that dire necessity alone will force their abrogation, and then only after a struggle of extreme bitterness.

This necessity may be deferred by the speedy repeal of some of the most injurious of their provisions. At present, owing to the absence of compulsory registration and to the mass of antiquated verbiage and intricate technicality that renders the transfer of land impossible without the expensive aid of a skilled conveyancer, it is a costly and tedious undertaking to invest in a freehold. A case has recently been mentioned in which a poor man who bought three acres of glebe land, had to pay $565 merely for the legal examination of the title deed. The passage of a compulsory registration law, like that in force in many Continental lands and in this country, would so facilitate and cheapen the purchase of land that the number of freeholders would be constantly increasing and the burden of rent proportionately diminishing. Moreover, this increase of freeholders would lessen the social distinction at present attached to the possession of land, and gradually deprive it of the "fancy" value it now bears, and in this way enable the farmers of the future to realize a fair interest on the capital invested in the purchase of their homesteads.

Within the last 25 years the number of land-owners in the United Kingdom has been constantly dwindling, while the aggregate value of the land has increased nearly 15 per cent., and the rental, on an average, five shillings an acre. At present the rental of the agricultural lands in England amounts to the enormous sum of $350,000,000 a year. This is the tax which the farmers of the country have to pay to the landlords for the privilege of investing their labor, skill and capital in the effort to wring a livelihood from the soil, while hampered by a meshwork of restrictions created by land-owning legislators for the benefit of their own class. The British farmer is not permitted to follow the system in agriculture which seems to him the most advantageous for his own interests, but must conform to the regulations which the landlord deems most conducive to his own benefit. The tenant, in nearly all cases, is compelled to use a stipulated quantity of fertilizers, either bought or made upon the farm; he must follow the rotation of crops prescribed, not by his own judgment, but by his landlord's wishes, and he must dispose of part of his produce as dictated by the latter, who generally insists that a certain proportion of it must be used on the farm for his own benefit. Owing to the rigid and complicated law of fixtures, passed by landlords for their own gain, all the improvements put on the land belong to the land-owner. The Agricultural Holdings Act of 1875 pretended to secure to the farmer some compensation at the end of his lease for the improvements he might have put on the land, but the measure was hampered by so many clauses and provisos that, in practice, the amount of such compensation usually depends on the landlord's pleasure. To prevent, as much as possible, all chances of risk to the latter, the law gives him a first lien upon the crops to secure any debt due him by the tenant, while the claims of all other creditors must be postponed to his interests.

These interests having been secured by these and similar precautions, the law provides carefully for his amusement by a rigid system of game laws. Not only is the farmer severely dealt with for interfering with the partridges or pheasants that may be met with on his own acres, but even rabbits—the greatest pest of the agriculturist—are protected, and the despoiled farmer has no redress. Nor is this all; for, having wastefully fattened the game for his lord's sport, he must patiently see, without legal indemnity, his meadows, pastures and grain fields pouched and his fences injured by the reckless rush of that lord and his friends, amusing themselves by boldly following, with horse and hound, the fox or the timid hare. Surely it is time that the laws that sanction these grievances should be wiped from the statute book whose pages they disgrace. If this be done before agitation on the land question arouses bitterness throughout the community, it is not improbable that the measure will give a new lease of life to existing laws concerning entail and settlement, the two features in British legislation that are mainly responsible for the accumulation of real estate in the hands of the aristocracy.

In addition to high rent, short crops, foreign competition and legalized hardships, the British farmer finds another cause of distress in the increased expense of working his farm. Within the last quarter of a century its ratable value, and consequently the taxes on it, have increased considerably; local taxation for sanitary and other purposes have multiplied; labor costs about 25 per cent. more, and is worth fully 12 per cent. less; the requirements of present agriculture demand a considerable increase of capital, for which its products return little or no interest.

All these causes sufficiently account for the present distress among our farming friends across the water. The extent of the losses of even some of the best of them is shown by the balance sheet of a farm of 600 acres, lately published in the London Times, and which is a fair specimen of many similar accounts which have appeared in other papers. This shows an annual deficit of $1,709 for the last three years. During that time the annual outlay on this farm of alluvial river loam was $17,700, exclusive of the expense of the farmer's family, while the income was only $16.000. Nearly half the outlay was made up of rent, $7,500, while the taxes amounted to $750. What industry can prosper with such a tax paid by labor to idleness, while so many other drawbacks trammel its efforts!

"FIRMING" THE SOIL.

"I FIND this matter of firming the soil is looming into vast importance. I was out among the bulb-growers in Long Island last week; one of them showed me a bed of gladiolus seed that he had sown last spring, nearly all of which had failed to germinate except a small portion in a hollow where the water had stood and firmed the soil around the seed."—[*Peter Henderson, in New York Tribune.*

We have raised Gladioli from seed for the past ten years, and have found that they germinate freely only in the shade, in moist soil, or both. The seeds, moreover, are winged, light and, as they must be sown shallow, many would blow away in a loose, dry soil. The better germination of those "in a hollow where the water had stood" need not, therefore, be attributed to the "firmness" which the water had caused. Had corn been planted upon the same field, probably the reverse results would have attended germination, else we need have very little faith in underdraining. Mr. Henderson's address upon the advantages of "firming the soil" seems to have been copied by almost every agricultural journal in the land as if it were full of information both new and valuable. But we had supposed that the necessity of "firming" a loose soil after seed-sowing was known to every farmer and that the general use of the roller or similar implement for this purpose, was a sufficient proof thereof. It is a very plain case that seeds, to germinate well, must have soil in contact with them—otherwise the tender radicle receives no support and at once perishes. Especially is this true if seeds are sown during a period of dry weather when there is little moisture in the air spaces between the particles of soil, to assist in nourishing the germinating seed. "Firming" the soil, therefore, means simply the insuring of contact between the seed and the medium in which it is to grow. The looser the soil, the more is "firming" necessary; the more clayey the soil the less is it necessary. To "firm" a clayey soil would be detrimental to seed germination. Its tendency is to "firm" itself too soon, thus excluding air and moisture. The best that we can do with a clayey soil is to pulverize or break it up as finely as possible, so as to insure its contact with the seed. In this way also we render it a slower conductor of the heat of the day and the coolness of the night, both of which are harmful to the quick and vigorous germination of most seeds. We conclude that the "free propagation" of Mr. Henderson's address is rather a mark of consideration for this well-known seedsman than a tribute to its value, notwithstanding "the vast importance into which this matter of "firming" the soil is looming."

THE SIMPLEST THING.

IT seems to us that there have been more frauds perpetrated during the past season upon country people by irresponsible "tree agents" than ever before. At least we have heard more about these frauds than ever before. Cheats prosper where there are willing dupes. If people are sufficiently interested in plants to buy them of peddlers of whom they have no knowledge, it would seem that they would be sufficiently interested in plants to read reliable horticultural literature which would effectually guard them against impositions. The time for fall planting is again close at hand. All respectable agricultural journals will announce the catalogues of trustworthy nurserymen. We repeat our advice so often offered. Send for them—compare them and then select from those that offer at the lowest prices the plants desired. The remedy is a simple one and costs merely the stamp on the letter of application. We experience a malicous satisfaction when we find—as we always have found—that those who purchase the WONDERS which these shrewd and unprincipled tree venders offer, do not subscribe for country-home journals. Readers may rest assured that all meritorious novelties are recorded in their pages as soon as known. Producers are only too glad to publish them since they have no other means of bringing them before the public. When, therefore, strange agents talk of strange plants of marvelous properties or that produce anomalous fruits, they may unhesitatingly be set down as impostors.

Applause in Churches.—Applause by the congregation of what ministers say in the pulpit, has grown of late years to be of common occurrence. It was at first heartily denounced. Then it was tolerated. Now many congregations applaud as if it were quite "the thing." We believe that the City of Churches (Brooklyn) bears the honor of having introduced this custom, which is well in keeping with the inscrutable religious sentiment that pervades a large portion of that church-going community. Upon the occasion of Moody and Sankey's first appearance since their vacation—passed by Mr. Moody on his farm, and by Mr. Sankey in Europe—"a burst of applause greeted the close of the first hymn." But Mr. Moody promptly checked it. He reminded the assembly that they were *in the house of God, not in a theater*, and the indiscretion was not repeated. We are in favor of "liberal ideas" in all things—political, social and moral—but it has always seemed to us that applause in church during Sabbath worship, desecrates the place and the time, and must strangely grate upon the sensibilities of those who are collected together to reverence God. If it is the *minister* we go to worship, then it is well to clap the hands or to laugh when he says anything especially good or funny. We hope that Brooklyn's irreverent innovation will never be tolerated, at least in the churches of our quiet hamlets and villages, and that our country people will continue to deem a reverential silence an essential part of their Sabbath devotion.

BREVITIES.

"GIVE us the man who sings at his work."—*Carlyle.* Would whistling answer?

THE GOLDEN RURAL is again our first tomato to ripen. Will our readers tell us how it is with them?

DR. A. C. WILLIAMS, Hugo, Ill., tells us that he raised a head of Defiance wheat with 115 grains in it. Why, Doctor, did not you think to send us that head of Defiance wheat, so that we could have had it drawn and engraved?

WORK vigorously while you work—have your wits about you, and never take two steps when one will answer. Then as soon as fatigue is felt, it is better economy to take a nap than to continue labor. No man can be prompt, happy, enthusiastic, or even systematic, that habitually overworks himself.

MR. GEO. J. KELLOGG writes us from Janesville, Wis., as follows: "Among the Black Raspberries, Great Western takes the lead, being nearly twice the size of Mammoth Cluster, as vigorous and productive and more hardy, as Mammoth Cluster was killed badly the past winter, while Great Western was uninjured."

THE haste with which many of us jump at conclusions is illustrated in nothing better than the condemnations which are being heaped upon Pearl Millet. These writers are altogether premature. Let them wait a bit—count thirty and hold their wrath. Two weeks hence they will wish to recall their hasty words. Judging from our tests of last season, it does not start into vigorous growth before the latter part of July in this climate—and the present season it is the same.

MR. WM. PARRY writes us of the Cuthbert: "I consider it one of our most valuable Red Raspberries, and it may be placed by side of the QUEEN OF THE MARKET, which it very much resembles in large size, bright red color, handsome and attractive appearance, strong, vigorous growth, hardy and productive canes, and it has probably descended from the same healthy parentage. We propose planting them both largely and would recommend others to do so, believing that whoever plants either or both will be well rewarded."

POTTED Strawbery plants can be purchased for 50 cents per dozen. We recommend Sharpless, Cumberland Triumph, Prouty's Seedling, Charles Downing, Borden 30, Pres. Lincoln, Miner's Prolific, Champion, Kentucky and Glendale, for trial. A fair proportion of them may be relied upon to give satisfaction in any soil in which the Strawberry will thrive at all. Prepare the ground liberally; manure liberally; set the plants one foot by 18 inches apart and see—you who have never given any particular attention to the Strawberry—if your family do not declare that "it pays."

PRIZE ANIMALS IN THE ROYAL AGRICULTURAL SOCIETY'S INTERNATIONAL EXHIBITION AT KILBURN.

1. Hackney mares, with foals, and mules. 2. The Earl of Ellesmere's Young Prince of the Isle. 3. The Earl of Ellesmere's Stamford III. 4. Mr. Richard Garrett's Cupbearer III. 5. Mr. David Buchanan's Druid, winner of the Champion Cup and the first prize in the class for Clydesdale horses, four years old and upwards. 6. The Marquis of Exeter's Sea Gull, with Telemachus IX., Telemachus VI., and two daughters, Shorthorn family. (See our European Correspondence, last issue.

Literary Miscellany.

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER IV.

It was with difficulty Miss Elizabeth refrained from saying, "I told you so," to her nephew next morning. Robert had come home early on Sunday evening, had gone straight to his room, and had locked himself in. Miss Yorke had heard him pacing restlessly backwards and forwards late into the night, when all the household was fast asleep; and, if she could have known the jealous doubt and dread that were racking him all through those wakeful hours, her own slumbers would have been the sweeter. A start—a change of color—a trembling hand upon his arm—these were what haunted Miss Carew's lover all night,

"While sleep beheld him from afar awake."

These were the thorns that pricked his restless pillow.

What did Olive's agitation—her sudden uncalled-for agitation—mean? And had it—could it have—any connection with that group of men, one of whom seemed to have been traveling or about to travel? She had been talking quietly enough a moment before they saw these men; she had been smiling at him; and then——. It was useless for the Doctor to tell himself over and over again that he was wronging Olive cruelly by such thoughts—that she had of her own accord and for the first time kissed him when they parted, as though she wished to assure him that she had done him no wrong. He told himself this, but—how cold the little hand was that he had touched! How pale her lips were as she held them up to him! And that man, that tall man in gray clothes who had seemed to follow them! Big drops started on the Doctor's forehead as once again Olive's half-desperate admission, "I love somebody else—somebody who can never be anything to me," came back to him, and he remembered that respect, friendship, esteem was all he had a right to expect from Miss Carew. Would she tell him frankly in the morning the reason of her emotion—he could forgive a great deal if she would only be candid and trust in him—or would she let this horrible secret lie like a mist between their eyes, so that they could never meet again clear and unembarrassed as before?

"I have been too happy," Robert Yorke groaned in the midst of his self-torment. "I felt it last night as we walked across the fields together. There was something in her face that told me so; and now some trouble is to fall upon us, and those bright, peaceful days are over. Well, if she will only let me love her still!" He fell asleep at last, as day was breaking gray and cool and the birds began to wake.

Not far away Gertrude was dreaming of him in her warm white bed, where perhaps she too had lain and tossed and ached for him as he grieved now for the pale girl who had bewitched him. Gertrude's roses were blooming however at breakfast the next morning; but Dr. Yorke came down languid, moody, complaining irritably, when questioned of headache—he who had never had a headache in his life, his aunt remembered.

Miss Elizabeth poured out a large cup of tea for the Doctor, and supplied him with the crisp, golden dry toast which he loved, and bade Gertrude air the newspaper for her cousin; but the thought in her heart as she ministered to his wants was that he had quarreled with Olive Carew, that it was but right he should suffer for his folly, and that after all it was never too late to mend. This thought imparted quite a briskness and gayety to Miss Yorke's manner during the morning, and she kissed her niece more than once so affectionately that Gertrude was puzzled, and began to indulge in a little uneasy hope—she could not help it though she tried—that something was wrong about Miss Carew, and that perhaps the actress would go away and leave them all to the happy life they had led before she came to disturb it.

Neither aunt nor niece said one word of what was in their minds; and when Miss Elizabeth came into the drawing-room, where Gertrude was practicing her pieces, and said that she had a little business to attend to, and would probably not be home to luncheon, they both agreed silently to believe that this business would be confined to the neighboring tradesmen, and would not include a call on Miss Carew in the hope of obtaining some clue to the Doctor's low spirits.

The sun streamed into the prim old drawing-room; Gertrude's nimble fingers plied her needle busily, while Miss Yorke wended her way to Olive's lodgings, a pleasurable anticipation of trouble in that quarter buoying her up and quickening her pace. The early freshness of morning was on the streets still. Rooks were sailing in the blue air across the ivy-grown turret of an old church; the lilac bushes in a square close by were in bloom, and scented the light wind as it blew; bunches of spring flowers were displayed in the shops; the flags shone white in the sunshine, and some young ladies who were out wore pretty, light-colored dresses, that made them look like flowers, too. Children were running and dogs barking joyously in the square as Miss Yorke went by, but she saw nothing—not even the new straw bonnets in the milliner's window. What had Robert seen or heard to make him so unhappy? That was what she was pondering, with brows knit and downcast eyes. If that woman had but revealed herself to him in her true character now, before it was too late! With the hope before her of getting rid of the actress, Miss Elizabeth felt her bitter dislike for Olive redouble, and remembered that from the first she had distrusted her pale, lackadaisical face and affected ways. And now perhaps things would return to their old footing. Miss Yorke's will would still be law in George street. There would be no talk of giving up the silver and linen and keys, her seat at the head of the table, her authority over the tradespeople and servants, to a girl out of a play-house, whose only thought was a sickly boy and his perpetual whims and fancies. And, if Robert married Gertrude, who looked up to her aunt with such affectionate respect, how different things would be!

Miss Yorke, trudging along sturdily, was so busy with these agreeable reflections that she would have passed her nephew, who came towards her just then, if he had not stopped and spoken to her.

"You are going to see Olive, I suppose?" he said in a tired kind of voice. "I will spare you a useless walk. She is out."

"You have just called?"

"Yes."

"Robert"—Miss Yorke laid her hand on his arm impressively—"there is something wrong! Now don't deny it—I can see it in your face."

"Something wrong? What—because Olive has gone to rehearsal? Absurd!"

"But she did not tell you last night that she would be out," Miss Elizabeth persisted, "or why should you call at this hour?"

"Because Olive was not very well last night," said the Doctor, coldly, changing color, "and I wished to inquire after her—that is all. And now I must be going—I am tremendously busy to-day."

He was gone. Miss Yorke turned and looked after him, with a kind of triumph in her face, though she was vexed too.

"It is a quarrel," she thought, "and a serious one. What can it have been about? Well, Miss Carew may be out or she may be in, but I am determined to see her, if I wait all day."

And so she turned down the sunny street, where trees grew behind the old red-tiled houses, and stopped at Mrs. Allen's iron gate. Both gate and door stood wide-open. A child's toy lay on the grass-plot, and in a pair of toddling legs trotting down the street towards an organ that was grinding an Offenbachian measure, and in Mrs. Allen's cap-strings flying in pursuit, Miss Yorke saw the reason of the unguarded state of the house. She was equal to the occasion.

"There is no one to tell me whether Miss Carew is in or out," she decided boldly. "I will go upstairs and wait."

Miss Yorke was on the little landing above by the time baby Allen was brought home struggling and roaring lustily; and, when the shutting of a door in the back regions deadened these sounds, the house was so still that she could hear the faint ticking of the clock on Olive's mantelpiece. After a ceremonious knock to which she received no answer, Miss Yorke opened the actress's door and walked in. A faint fragrance of violets was in the air, a white curtain moved slowly in the breeze at the open window, the usual litter of papers and books was on the table, a half-covered blue-satin boot, with the needle still sticking in it, lay on the window-ledge by Olive's chair.

Miss Yorke looked round her grimly. The smell of flowers in the room seemed like an affront to her. It was an immoral sort of thing, she considered, and savored of trashy novels and high-flown airs. The cool April breeze had a rheumatic tendency, so the window was closed without ceremony, Miss Yorke eyeing the little boot the while, with a contemptuous "Humph!" and charitably deciding that it had been left there for effect. Robert made such a ridiculous fuss about the smallness of his sweetheart's foot.

"If matches his brain nicely," she said to herself wittily; and then—the opportunity was too tempting to be resisted—she began to make a tour of the little room, and to examine the countless little knick-knacks with which it was filled, handling them as gingerly as if she dreaded the infection of Bohemianism from their mere touch.

A large book of photographs lay open on the piano. Miss Yorke adjusted her gold eye-glasses and turned the pages, with a silent protest against their contents in every line of her face. Olive Carew in every imaginable dress and attitude, each one prettier and more graceful than the last—that was what the big book—the Doctor's gift—amounted to; Olive in a coquettish Watteau dress, with mittens and powdered hair, and an arch smile in her beautiful eyes; Olive crazy in white drapery and long, densely-falling hair, offering the beholder "pansies for thoughts," with a piteous air of entreaty; Olive as a saint with holy uplifted gaze and folded hands; Olive in a riding-habit; Olive in a yachting costume; Olive as a nun; Olive as a boy, as a queen, as a gipsy, in picturesque rags, in a ball-dress, in her old black gown.

With an impatient exclamation, Miss Yorke shut up the book and walked away. She had never seen Miss Carew on the stage, Gertrude's mourning not allowing her to appear at a theater just yet, and she asked herself scornfully if this was what took men's fancy nowadays, and if they supposed all these smiles and attitudes and bare arms and shoulders would look well in a drawing-room, or would help a wife to order a good dinner and look after the children. How could Robert ever take this player-woman down to the old home in Lincolnshire, and what would folks there say to her big eyes and her trailing gowns and die-away airs? Once more a pang of bitter, unavailing hatred of Olive shot through Elizabeth Yorke's heart as she sat down at the table and waited doggedly for the actress's return. An open "part" lay at her elbow, and, seeing what it was—or guessing—she brushed it away with a gesture of disgust. In doing so she knocked down a little leather writing-case, scattering the papers it held on the floor, and as she replaced them, a name on an envelope caught her eye—"Lord Blantyre."

It was in Miss Carew's delicate writing, and the envelope, which was unfastened, contained a letter—with no superscription, but in Miss Carew's hand, addressed to a lord! Miss Yorke's heart began to beat, a dark flush rose to her face; she caught the letter up with trembling hands, and, after a hurried glance at the door, deliberately opened the envelope and read its contents.

CHAPTER V.

Miss Yorke's hands trembled still more as, having read and re-read the letter, she folded it up and put it, in its envelope, into her pocket. Her excitement was great. She could not sit still, but rose and paced the little parlor, hurriedly, beating one hand against the other and muttering rapidly to herself. Morning was wearing away into afternoon, luncheon was over long since in George street, but Miss Elizabeth would not go home till she had seen Olive Carew. She took her seat at last in the bow-window and watched.

She could hear Nelson's cheery little treble piping to baby Allen, and a smell of something roasting for the actress's dinner began to pervade the small house. The organ-man, who had unconsciously helped her to the discovery of the letter, saw her grim figure sitting at the window as he came up the street, and played "*Dites-lui*" and "Down in a Coal Mine" all through without provoking a gratuity, and then, just as the little clock on the mantelpiece struck three, Miss Yorke's patience was rewarded, and she saw the tall figure she was waiting for coming slowly down the street. Miss Elizabeth drew herself up and put herself in battle array. Every line of her brown silk armor was in its place, her smart bonnet had the air of a helmet, her umbrella seemed turned into a sword as she grasped it in her strong hand. There was a joyous greeting at the door as Nelson ran to open it for his sister, then some quicter words followed, and Olive came up-stairs and into the little sitting-room alone. She was pale and tired, and looked as if she had been crying. The uncompromising face she found awaiting her was rather a trial to her nerves just then.

"Miss Yorke!" she said faintly. "They did not tell me you were here. Have you been waiting long? I have been detained."

"I have been here two hours," her visitor replied, so rudely that Olive turned, flushing a little, and looked at her, surprised.

"I thought Mrs. Allen understood that I was not at home to any one to-day," she answered gently. "I am not very well. I have had some painful business to attend to, and——"

Miss Yorke coughed.

"You are very kind," Olive said, smothering a sigh; and she took off her hat and threw it on to the table. She was thinking of the quiet hour she had hoped for before going to her work again, and she could not keep the weariness and dejection out of her voice as she sat down and leant her head back in all its fair young beauty against the dingy horse-hair chair. "I am sorry I missed Dr. Yorke," she added. "I did not think he would call here so early."

"He did not know that you were more agreeably engaged, of course."

Again Olive turned and looked at her visitor, surprised.

"May I ask what you mean?" she said, quietly. "Even if I had been at home, I do not know that I should have seen Robert this morning. I do not feel able to talk to any one, and really I believed that these rooms were mine, and that I could give what orders I pleased in them until to-day."

"That is meant for me, I suppose;" and Miss Elizabeth laughed scornfully. "I can assure you, Miss Carew, that nothing but a feeling of duty induces me to remain another moment in this house, after what I have seen, though I don't value your fine-lady sneer the snap of my fingers."

Olive regarded the angry woman with eyes of quiet dislike. She had always known that they two must quarrel terribly some day, and now the day was come.

"You have something to say?" she returned, calmly. "My time is short."

"Yes! I have something to say," Miss Elizabeth cried, beginning to tremble again—"and something that you will do well to consider."

Olive bowed.

"You know well enough that I don't like you," the hard old voice went on. "I never pretended to like you. I have had plans of my own for Robert, and you come here to upset them all. How can you expect me to swallow my disappointment and meet you with open arms—you and your sickly brother, who will be a trouble and an expense as long as he lives?"

Olive was silent. A shudder ran through her veins as she noticed, for the first time, that there was in this coarse, ill-tempered woman's face a likeness to Dr. Yorke.

"Will he look like that in a few years?" she thought, wretchedly. "Could he speak like that if he were angry?"

Miss Yorke had taken breath, and was ready to go on.

"I have told Robert often and often what I thought of you; but what is the use of talking to a man while he is infatuated, and blind, and——"

"I shall be glad if you will come to the point," Miss Carew interposed in her low voice, that contrasted so strangely with the elder woman's high-pitched accents—as strangely as her pale beauty with Miss Elizabeth's angry purple face, set in its gaudy ribbons.

"Then this is the point!" the Doctor's aunt cried fiercely. "I have found out the intrigue you are carrying on. I know what appointment you have been keeping this morning, Miss Carew"—with a deadly emphasis on Olive's pretty name, as though it were an offence in itself.

"Go on," said Olive, turning pale, but facing her adversary with steady, lucid eyes. "Let me know of what you suspect me."

"Suspect!" Miss Yorke echoed. "I tell you I have proof." Here her hand involuntarily sought the stolen letter in her pocket. "I have a hold over you that you don't dream of, and I mean to use it if you force me, but for Robert's sake, for the sake of our name, I want no fuss—no scandal—and I am willing to compromise if you and I can come to terms."

"Go on," Olive said again.

"You had words with Robert yesterday—I saw that plain enough by his face. You would not see him to-day. Well, I don't think you will have many more chances of saying 'Not at home' to Dr. Yorke."

"Go on."

"Of course it is for his money you want to marry him. He's not the sort of man to take your fancy I warrant!"

"Go on."

"But, if you do marry him, not a soul in Woolchester will visit you, remember that! You will ruin the Doctor; and what will you be without your dressing and acting, and with no men to run after you, sitting by yourself all day, and minding your house?"

"Go on."

"Miss Carew, I have a little money by me that the Doctor knows nothing of. Give me back his promise—I dare say you have got a written one from him—leave here at once, and I will give you three hundred pounds, and——"

Olive started up, stung to the quick by the deadly insult.

"How dare you, madam?" she panted out, the indignant blood rushing in torrents to her face and throat. "What must you think of me? How far too mercifully I have hitherto judged you! For your brother's sake I will endure much, but, as for this"—with a passionate gesture of contempt—"I will not stoop to convince you of the terrible mistake you have made. I will never address another word to you as long as I live!"—[To be continued.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

"HOME PROTECTION."

An Argument for Woman's Temperance Ballot.

BY FRANCES E. WILLARD,
PRESIDENT OF ILLINOIS W. C. T. U.

KEY TO THE POSITION.

"Ah! but," pursues our doubting friend, "Maine is a peculiar State, in this: it has few foreigners, with their traditions of whisky and of beer."

I grant you there we are at disadvantage. But go with me to the Cunard wharves of Boston and to Castle Garden of New York, and as the long procession of immigrants steps across the gangway, you will find *three times as many men as women*. How can we offset their vote for free liquor, on Sundays and all other days? Surely, the answer to this question is not far to seek. Strengthen the sinews of old King Majority, by counting in the home vote to offset that of Hamburg and of Cork, and let American customs survive by utilizing (at the point where by the correlation of governmental forces "opinion" passes into "law") the opinion of those gentle "natives" who are the necessary and tender guardians of the home, of tempted manhood and untaught little children.

Hands which have just put aside the beer-mug, the decanter, and the greasy pack of cards are casting ballots which undermine our Sabbaths, license social crimes that shall be nameless, and open 250,000 dram-shops in the shadow of the church and public school. Impressed by the fact that when voters meet voters the side will win that has most votes, I solemnly call upon my countrymen to release those other hands, familiar with the pages of the Book of God, busied with sacred duties of the home and gracious deeds of charity, that they may drop those whiter ballots in, which, as God lives, alone can save the State! Great guns of influence are pointing into vacancy, when they ought to be swung to the level of benignant use and pointed on election day straight into the faces of the foe.

THE WOMEN OF ILLINOIS.

Kind friends, I am not theorizing. I speak that I do know and testify what I have seen. Out on the Illinois prairies we have resolved to expend on voters the work at first bestowed upon saloon-keepers. We have transferred the scene of our crusade from the dram-shop to the council-room of the municipal authorities, whence the dram-shops derive their guaranties and safeguards. Nay, more. The bitter argument of defeat led us to trace the tawny, seething, foaming tide of beer and whisky to its source; and there we found it surging forth from the stately capitol of Illinois, with its proud dome and flag of stripes and stars. So we have made that capitol the center of our operations; and last winter, as one among the many branches of our work, we gathered up 175,000 names of Illinois's best men and women (50,000 being the names of voters), who asked the legislature for a law giving women the ballot on the temperance question. In prosecuting our canvass for these names, we sent copies of our "Home Protection Petition" to every minister, editor, and postmaster in this State; also to all leading temperance men and women, missionary women, and Grangers; teachers, Odd Fellows, and Free Masons; Greenback and Red-Ribbon clubs: to Quakers and Catholics, Knights of Pythias and express corporations; Jews, Gentiles, and railroad companies.

In this way our great State of 55,000 square miles was permeated, and in most of its 1,000 towns the petition was brought before the people. The religious press was a unit in our favor. The reform clubs of the State, with ribbons blue and red, helped us with their usual heartiness and efficiency. And what shall be thought of the advance in public sentiment, when (as was often done) all the churches join on Sabbath night in a "Union Home Protection Meeting," and Ministers of all denominations (Presbyterians included) conduct the opening exercises, after which a woman presents the religious duty of women to seek and men to supply the temperance ballot; and, to crown all, conservative young ladies go up and down the aisles earnestly asking for signatures, to the tune of

"Stand up, stand up for Jesus,
Ye soldiers of the Cross;
Lift high His royal banner,
It must not suffer loss."

Friends, it means something for women of the churches to take this radical position. America has developed no movement more significant for good since the first dawning of the day we celebrate.

The State of Indiana stands with us; only there the temperance women have worked out the prob-

lem of deliverance further than we, and asked the ballot on all questions whatsoever. They do the same in Minnesota and in Iowa: while at the East the W. C. T. U. of grand old Maine endorses the temperance vote, and Rhode Island sends to Illinois resolutions of approval, while Massachusetts, under Mary A. Livermore, has declared for Home Protection and is preparing for the fall campaign; and within a few days Ohio, the Crusade State, which is the mother of us all, has fallen into line. The most conservative States are Connecticut, New-Jersey, and New York; but in each of these there are many brave women, who but bide their time for this same declaration, and the whole twenty-three States already joined in the Woman's National Christian Temperance Union will ere long clasp hands in the only work which can ever fulfill the glorious promise of the Crusade. History tells us that on the morning of December 23d, 1873, when in Hillsboro, Ohio, the penteeostal power fell on the "praying band" which first went forth, the leading men of that rum-cursed town went out from the church where their wives and mothers had assembled saying: "We can only leave this business with the women and the Lord." History has repeated itself this winter in our Illinois crusade. Men have placed money in our hands to carry ont his work, saying: "the women of America must solve this problem. Our business relations, our financial interests, our political affiliations and ambitions have tied our hands; but we will set yours free, and you may rid us of this awful curse."

WOULD WOMEN VOTE RIGHT?

Yet a few men and women, densely ignorant about this movement, have been heard to say: "Who knows that women would vote right?" I confess that nothing has more deeply grieved me than this question from the lips of Christian people. Have distillers, brewers, and saloon-keepers then, more confidence in woman's sense and goodness than she has herself? They have a very practical method of exhibiting their faith. They declare war to the knife and the knife to the hilt against the Home Protection Movement. By secret circulars, by hired lobbyists and attorneys, by the ridicule of their newspaper organs, and threats of personal violence to such women of their families as sign our petition, they display their confidence in womankind.

The only town in Illinois which sent up a delegation of citizens openly to oppose our petition was Belleville, with its heavy liquor interest and ten thousand German to three thousand American inhabitants; and among our 204 legislators there were no other dozen men whose nagging of the Home Protection Committee was so persistent and so petty as that of the senator who openly declared he was there to defend the vested interests of his Peoria constituents, who in 1878 produced eight million dollars' worth (?) of ardent spirits. Nay, verily, woman's vote is the way out of our misery and shame, "our enemies themselves being judges." The women of the Crusade must come to judgment—not, as aforetime, with trembling lip and tearful eye, but with the blazing sword of power; and none see this so clearly as the liquor dealers, whose alligator eye is their pocket-book, and the politicians, whose Achilles heel is their ambition.

HOW WOMEN DO VOTE.

But, after all, "seeing" is a large part of "believing" with this square-headed Yankee nation; so let us seek the testimony of experience.

In Kansas the law provides that the signatures of women shall be requisite to a petition asking for a dram-shop before that boon shall be conferred upon any given community. This arrangement wrought such mischief with the liquor dealers that they secured an amendment exempting large towns from such bondage. But in small towns and villages it has greatly interfered with the traffic, and has so educated public sentiment that prohibition can—with impunity!—form the theme of a governor's inaugural, and Kansas is on the war-path for a law hardly less stringent than that of Maine.

In Des Moines, Iowa, a few weeks since, as a test of popular opinion, the women voted on the license question; twelve declaring in favor of saloons and eight hundred against them. In Newton, Iowa, at an election ordered by the council, 172 men voted for license to 319 against—not two to one against it; while the women's vote stood one in favor to 394 against licensing saloons. In Kirkville, Mo., ten women favored the liquor traffic, twenty declined to declare themselves, and five hundred wanted "no license." In our Illinois campaign, which resulted in 95,000 names of women who expressed their wish to vote against saloons, not one woman in ten declined to affix her name to our petition.—To be continued.

THE WOMAN'S CLUB.

A VIGOROUS PROTEST.

MISS FAITH RIPLEY:—I was interested in your contributor "M. L. S.," for having presented so fine a method for preparing that very popular beverage—coffee. It is just my particular plan, although not a practice of mine for reasons I might state, but conclude to keep my private domestic affairs from the gaze of the world, thus avoiding painful and unnecessary criticisms from a rabble of meddlesome, motherly old—what shall I call them? No bad names, of course. No—but suffice it to say, M. L. S.'s method is not new, though valuable. But I am at a loss to know by what right she dares to bring forth from the land of the past, visions of the steaming old coffee-pot which afforded me so much comfort in its day, and but for my *then* ignorant doings, might still have served me, in some way. Is it possible she knows how I was so short-sighted as to do what she recommends as a cleansing operation—that is, to use ashes? I had supposed no other person in the world was so foolish but my humble self; but since I've no remembrance of giving any but my little girls the benefit of my experience, I shall take the liberty to ask the lady to introduce herself, and then let us hold discussion over the propriety of treating the time-honored coffee-pot so abusively. Perhaps she is a quarrelsome creature like some people I've known and shunned all my days; and perhaps she wished to intrude upon my especial realm—the kitchen, the dining-room, the chamber and the sitting-room. If so, allow me to state her place is the sitting-room while we hold this confab over the coffee-pot. Mine is none of those prim affairs, gotten up by a coffin-dealer, smelling of varnish and dazzling with gilt—(I deal in realities, and have all my life)—and while I beg leave to state that I commenced housekeeping without much practical knowledge of the art, yet my natural ability helped me, together with what I learned from observation; and but for a kind, considerate mother who was guilty of an oversight in the management of her daughters, (or of a slight error) I might have known that ashes are ruinous to the kind of tin in use now-a-days; a kind which poor people have to deal in. It is possible M. L. S. does not know even one of the many little valuable items which I might teach her (if she is young and inexperienced, as I once was,) but I will say that I believe ashes to be injurious to the best quality of tin, and that according to my experience, gained as it has been, by not having sand procured for me when I should have had it, frequent, thorough washing with soap-suds is the first best process, if only thorough rinsing with hot water, and drying by heat follow it. Then, when polishing is really necessary, the sand if of fine quality, will be harmless in removing stains from the inside of the coffee-pot as well as the tea-pot. If M. L. S. can afford two tin pots for coffee and leave the ashes out, her plan is well enough. My poor little stock of patience has been meddled with in ways too aggravating to describe, especially, in the face and eyes of a respectable corps of editors, so I forbear to further teach M. L. S., without personal acquaintance.

Perhaps she may not comprehend that ginger, when we first get it, is full of fibrous atoms, and then if sifted, for pumpkin pies or other pastry, the fibrous portion is fit to add to the vinegar used for pickles if one likes the flavor in the vinegar, and if not pies and cookies are improved by it. Perhaps I am capable of learning something more than I already know through the columns of the Domestic Economy; but even then one should have a right hand *man* to help carry all these truly nice arrangements into effect. If you have a fine piece of steel in the house without a handle, which could with the help of a man and proper tools, be the chief instrument in constructing a very handy article called a "bread-cutter" you are smarter than I am, if you can go to a shop—within sound of your voice, and say to the man who presides there, "I know how this should be made, but I have not time nor patience or I would do it." Perhaps *you* would say, "I will borrow the tools and construct the article myself." Now I have sufficient mechanical ability to manufacture just such an article with my own hands but I am a woman and have not strength or time, so if my individual duties prevent me—and my husband should wilfully neglect to provide for my comfort, why, then, as it costs money to hire all this done, my little plans for bread-boards and brick-board for scouring knives and similar conveniences would be useless, and all because I am "A WOMAN."

MOTHER'S BIRTHDAY.

BY ZENA CLAYBOURNE.

God gave each year its season, in its turn,
Some subtle beauty, all its own,
But Summer stands among the rest,
For tender, lustrous charms, alone;
But even of summer months, one, June
Has such a rare, exceeding glory
That all the birds and leaves and flowers
Appear delirious with the story;
Yet, still, in June God gave to one day
More of sun than any other.
Then, to crown the work completely,
Sent on earth my precious Mother!
So, her birthday always comes
With balmy air, and blossoms gay,
The sweetest time of all the year,
The very longest loveliest day!

SHALL FANCY WORK BE TABOOED?

I AM deeply interested in the RURAL, especially so in the women's department. I read with interest the article, "Truly Spoken," by M. A. B. My attention was called to the words of Emily Faithful regarding fancy work. It is no wonder to me that M. A. B. is not fully in sympathy with that writer. I should wonder if any lover of the beautiful could, for one moment, wish fancy work "blotted out of existence." "If a man, or grown boy, should spend his time so foolishly, he would be considered, and rightly, either a fool or crazy," and yet strong, able bodied beings, *called* men, do spend their time shooting glass balls, lounging about street corners and in bar-rooms, indulging in indecent conversation, and are not "considered either fools or crazy," especially by their own sex.

I have noticed that, as a rule, lovers of flowers are lovers of fancy work. Go into any home that is entirely destitute of fancy work, and generally you find the yard a mass of grass and weeds. I have in mind Mrs. A. No fancy work adorns her rooms, no flowers beautify her yard or garden. Indeed, she has no desire for things of that sort. Go into her parlor, and you will find it neither cheery, cosy nor inviting. There is something inexpressively chilly and dreary about her home and its surroundings. Not so at Mrs. B's. Before you enter her home you have a promise of pleasant things. There is an abundance of flowers, and one can but stop and admire them, they are so beautiful. On the piazza is a flower-stand, filled with blooming plants; hanging in the window is a beautiful white dove (fancy work), which I always think is a proper emblem of the peace and quiet within.

The afternoon is pleasant, and Mrs. B invites us into her parlor. She is not afraid that the sunshine will injure her carpet. Here hangs a wax wreath of wondrous beauty, made by her own hands. The old ladies exclaim, "It is the prettiest thing I ever laid my eyes on!" Oh, but it is fancy work, "blot it out of existence!" Here is a hanging basket, made of card-board, zephyr and pictures—a lovely thing. I cannot speak of all the beautiful ornaments in that room—picture frames, wall pockets, brackets, etc., all making the room a cosy resting-place.

There is my friend May, who does not enjoy good health. No one can tell what a comfort fancy work has been to her. Hours, otherwise dull and dreary, have passed pleasantly away. With neither body nor mind in a condition for study, fancy work comes in admirably. I would not "deliberately sit down day after day," and kill time with my fancy work, (farmers' wives and daughters have something beside sitting down to do), but if any have a taste in the direction of fancy work, let them cultivate it. Many a rainy afternoon and odd spell may be pleasantly passed in that delightful occupation.

I believe the intense lover of the beautiful is really capable of a higher sense of enjoyment than one who cannot appreciate the beauties of nature and art. A woman with a taste for home adornment can, with very limited means, construct many articles, both useful and ornamental, that will give a charm to home.

I made a wall pocket after a description given in the RURAL, and it is really pretty, as well as useful. In my kitchen hangs a motto, "In God we Trust," worked with shaded red and green zephyr. Now that is fancy work; but it is of use as well as pleasing to the eye.

Many, many times, when I am tired (and cross, too, I fear), when I get discouraged, I happen to see my motto, "In God we Trust," then I ask Him to help me trust Him fully. So I calculate that my motto is a blessing to me. Let us love the good, the true and the beautiful, and by so doing, shall we not grow better?

I would like to express my thanks to the "clubites" for their interesting letters and words of good cheer. Yours cordially, MRS. J. W. K.

A PLEA FOR EDUCATION IN HOME MATTERS.

I AM very much interested in the RURAL, and especially so in the Women's Club. I have often thought I would like to join.

With delicate health and three little children clamoring for mamma's constant care, I hardly have time to avail myself of the Boston Society's liberality. As a profession for women take the management of children, by far the most important within the range of womanly duties, and for improvement a home-field now left to weeds and waste; a profession, to call it by its right name, which it is in the power of every woman, whether mother or childless, to honor and perfect.

There is nothing, as things are, in which women need enlightenment more than in this same management of infants and the education of children. Where one has an intelligent understanding of the needs and proper care of infants, thousands are as ignorant as owls of the very alphabet of physiology, and consequently they make the most disastrous mistakes in practice. Go into the homes of the educated and watch the nursery diet, the clothing, the hours, the general arrangements, and then say whether the management of the next generation, which is by far the most precious thing belonging to the present, is of a character to rejoice the soul of one who hopes for progress, and who loves his kind. Yet woman ought to learn something of the requirements of motherhood, and not spend energy and strength in studying abstract questions which are simply intellectual pleasures, and of no human profit, while the best mode of making fine men and women out of the raw material of infancy is ignored as a thing of no value. This is but a queer inversion of natural duties—I confess not quite to my taste.

If this mismanagement or ignorance is true of so-called educated mothers, what is the condition, then, of the uneducated? The wonder is not that so many children die, but that human life is so tenacious, and that so many of these delicate little creatures survive the ill-usage to which ignorance and mistaken kindness subject them from the very hour of their birth.

You hear one of these young mothers boast complacently that her baby, only a few months old, sits up at the table with the family and takes all they have, while she crams it with pudding, potatoes and stringy meat.

Suppose girls were taught as a matter of education, what babies are like, and the best way of managing them, if ever they had them, do you think they would go counter to their education any more than they do now, when they have to bake bread or roast meat? It is only because girls are never taught when young, that they make such terrible mistakes when they come to the possession of little ones. BROWNIE.

STRINGS.

"WIFE, will you get me a few strings to tie up those young grape-vines with;" or "Mother, can I have some strings to use for my flowers;" or "What shall I tie the tomatoes to the stakes with?"

What housekeeper whose husband loves his vines and trees has not had her ears saluted by such questions, and been puzzled to know where all the strings are to come from. Often when I have seen my husband stand with a broken and wilted branch of some cherished plant in his hand, and have heard him say, with a fallen countenance, "If I had had a suitable string yesterday when I saw this swinging in the wind, I might have saved it," I have ruefully made a mental parody on the well known saw, "For want of a nail the shoe was lost, for want of a shoe the horse was lost," &c. This Spring I determined that the supply should not fail. I accordingly provided a calico bag to hang in my kitchen, into which I should put everything that could be made into strings. Clippings and trimmings from the work table, strips of cotton—new and old—if not too old—twine from packages of groceries, &c., &c. It was surprising how soon it filled up, and how easily it is kept filled, though it is put under almost constant requisition to supply the regular wants. And if in the hurry of the moment its contents are pulled out and left on the table or floor, it is not much trouble to put them back, since one knows where they belong—and that is something worth knowing, too. I had a friend, new to the duties of housekeeping, who once acknowledged that she did not think herself a good housekeeper in some things. Said she, "I never *quite* make my rooms look nice. I can get *almost* picked up, but there are always a few things which I don't know what to do with, and so I leave them where they are." Now I acknowledge that, till this summer, strings have always been my bane because I never knew exactly what to do with them. I do not think any one of the few "improvements" we have treated ourselves to this season has given my husband half as much satisfaction as that bag of strings. Our new carpet is nothing to it. Indeed I am not sure there would have been any new carpet had it not been for the beneficent influences emanating from the wealth of that deposit. So cheaply can we make ourselves and others feel rich sometimes by supplying a long felt want. MRS. A. J. B.

NEATNESS IN THE HOUSEHOLD.

How much better one feels to think her house is clean when callers come unexpectedly; then why not have it so? When my windows get dusty or fly speeked I take clean water and wash them off, it takes but a little while and they look enough better to pay. I wash the doors and window sills once a week the year through. One can take a day when there is no baking or washing on hand. It takes but a short time if you do not let them get too dirty; but if they are left until they become so dirty that they must have soap, this soon takes off the paint, and it is hard work to get them clean. Then by giving the floor a good sweeping, and the furniture a good dusting, and with neat tidies on rocking-chairs and lounges, you have a neat looking room. But if the kitchen and pantry are not just as clean as the sitting-room, parlor and bed-rooms it spoils all. The pantry should have clean papers put on the shelves as soon as soiled, and every dish in its place, the floor cleaned and the walls brushed down to keep cobwebs off, the lamps trimmed and cleaned, and the yard around the door swept. But I am taking too much time on this subject. I was very much interested in Bertha Winkler's "Sunday Rest for Women"—those are my thoughts, exactly.

CANNED STRAWBERRIES.

Pick over the berries and put half as much sugar as fruit, and let them stand over night. In the morning drain off the juice and let it boil a few minutes, then put in the berries and as soon as they are heated through can up; this is an excellent way, they retain their color. D. A. R.

A SWEEPING HINT OR TWO FROM A SOUTHERN HOUSEKEEPER.

NOTICING something from one of your correspondents in reference to cleaning and dusting carpets, I will give you my experience. Take drawn, damp tea-leaves, sprinkle them over the carpet, and then sweep them off. This will both lay the dust and brighten the colors. Another very good way is to take a pail of water, put some beef-gall into it, dampen the broom with it and sweep the carpet. This will "set" the colors of the carpet, and will also set the colors of any goods, such as lawns, calicoes, etc.

Though I am an old lady, I have not lost my taste for flowers. I am very successful in their cultivation, and my friends often remark: "How is it that your flowers always look so fresh and flourishing?" I will tell you. I have raised eight beautiful geraniums, from the seed sent by the RURAL NEW-YORKER, which are pronounced the prettiest in the place. The way in which I manage my plants is to mix a little sand with the soil, then procure some manure from the hen-house and put on top of the other soil. By this means, the water, penetrating through the manure, carries just enough of the richness to the roots of the plants to make them grow well. MRS. T. J. B.
Okolona, Miss.

HOUSEKEEEPING NOTES.

AN economical lady of my acquaintance tells me that when she buys cotton stockings, she selects a good article, and before wearing them at all, she lines the feet with new thin muslin, that is the parts that wear most quickly—the heels and toes. She says they wear twice as long as they do without. The linings must be nicely fitted and run on smoothly, or they will not answer the end desired; but a little practice enables one to do it quite easily.

Where there is any suspicion that glass fruit-cans are not perfectly air tight, they can be made so by putting putty around the crevices after the cans are filled and screwed down. It is prepared the same as for putting in window glass. Stone jugs for fruit may be sealed in the same way, and with less trouble than with ordinary sealing-wax.

During the semi-annual house cleanings, as well as at other times, the neat housekeeper should avoid making a wholesale destruction of written papers, tax receipts, or indeed receipts of any kind. Sometimes old letters prove to contain information which becomes valuable to the possessor. Every house should contain some receptable for such business papers, and they should be filed and preserved for future use, if necessary.

AUNT RACHEL.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MRS. ENDICOT'S JOURNAL.

Early Tomatoes; something to interest the boys; how to take out machine oil; kerosene in starch; rusks and French currant cake; carbolic acid for heat and insect bites.

July 18.—We had some of Harry's tomatoes this morning for breakfast. He was quite proud to think that he had been so successful, and had his ripe before any one else. He has always been instructed in gardening, and last year his father gave him some ground for his own use to cultivate. He did very well with it, and this year, having had more experience, he is succeeding still better.

Mr. Kensie, an old experienced gardener, gave him some hints about tomatoes, which helped him, but part of his success was due to his own enterprise. He saved his own seeds from some tomatoes we had last summer and planted them in boxes in the house. As soon as the plants were an inch or less high, he transplanted the six he wished to keep, each into a pasteboard box by itself. Every pleasant day he would put them out in the sun, in a sheltered place. By the time the garden was made he had strong, healthy plants, a foot high and quite bushy. Being in paper boxes, all he had to do was to set the box into a bucket of water a for few minutes; then, after peeling off the bottom of the box, put box and all into the ground without disturbing the plant in the least. He set the plants four feet apart and trained them up on supports made of the branches of the peach trees we cut down this spring. Barton has always let his tomatoes run on the ground, so Harry was very much elated to hear his father say that he would try frames for his next year. Harry gets a good price for all he will sell, and the money goes toward the sum he is saving to buy a saddle and mounted bridle for the colt his father is having broken for him.

If farmers and those who have large gardens—or even small ones—would give some part of the ground to their boys to raise what they please on, and try experiments with, they would be astonished to find how much more interest the rising generation will take in the general work. Give the children for their own the discarded lamb which must be raised by hand, one from the first litter of pigs, and a few chickens, and see how much pleasure they will take in them.

July 28.—Washing-day on Monday always makes a very busy day, for there is the cleaning up and generally sweeping to be done also. Since I have been doing without a girl, I have had Mrs. Balligan to do my washing, ironing and scrubbing. She washes and scrubs on Monday and irons on Tuesday afternoon; for she cannot come in the morning, and ironing is such clean work that I do not care.

I learned two things from Mrs. Balligan today. I had got some oil from the machine on a piece of muslin I had just finished for the wash, and when I put it in I told her to wash it out as well as she could, then lay it on the grass to bleach. "Give me a little lard and baking soda and I can take it all out," she said. And she did, just by rubbing the stains well with lard, then soda, rubbing it well in. After letting it lie a little while, she washed the muslin in hot suds, and by the time it had been boiled, rinsed and dried I could not have found the places that had been stained.

Some time ago I bought some starch polish from a man who was around selling it. It proved to be very good, giving a good gloss to the articles and not sticking to the iron. I used the last of it last week, and when I was making the starch this morning, I said that I wished the man would come around again.

"I wish you would just try some kerosene," said Mrs. Balligan. "I know you would like it. I have used it for a long time, and it's the best of anything I ever tried."

She takes home washing and has a great many shirts to do up, so I knew her experience was worth something. She used one tablespoonful to about two quarts of starch, and it is so convenient, for it is something one always has in the house. I really never saw starched clothes iron nicer. I ironed one of Barton's linen vests before dinner, so he could have it for this afternoon, and it was really a pleasure to do it.

July 29.—To-day was baking day. I am always glad when afternoon comes, and I have a pantryful of nice, fresh things. We do not use much cake in summer time, but to-day I made an extra quantity of bread dough, and used part to make rusks and a French currant cake. When I work out my bread for the pans, I take off as much dough as would make two small loaves. Into it I work one cupful of sugar, two eggs and half a cup of butter; after it rises again, I take half for rusks, working them in the hand, and rubbing each one all over with melted butter, to prevent them sticking together, before putting in the pan. It is a little more trouble, but I think it fully pays.

To the other half of the dough I put one pound of dried currants, well washed and dried, let it rise again and bake in one loaf. Harry and Della think there is no cake like it, and I know it is far better for them this warm weather than any other kind. Unlike most cakes with fruit in them, it is better fresh.

Baby Katy is broken out so with the heat, and is so uncomfortable. Mrs. Glen was in this afternoon and she gave me the recipe of a wash she uses: Twenty-five drops of carbolic acid, one ounce of glycerine, half an ounce of rose water and two of pure cistern water.

It will give certain relief from bites of any kind and heat, and is very cooling to the most tender skin.

DOMESTIC RECIPES.

One way of

Making Potato Bread.

Boil five or six large potatoes, mash them smooth while hot, add a piece of butter the size of an egg, a tablespoonful of sugar, a teaspoonful of salt, and a pint of warm water. Beat three teacups of flour with another pint of warm water, till free from lumps, and then mix with the potatoes. Dissolve a cake of yeast and a teaspoonful of soda, each in a teacup of warm water, and beat all well together. It makes a thin batter and should be set in a warm place over night. In the morning sift three quarts of flour into the bread pan, with a little salt. Pour the sponge, which will be full of bubbles if the yeast was good, into a cavity in the middle and knead for five or ten minutes. Cover with a cloth and set in a warm place for an hour or longer, or until it has risen to double its usual size. Then divide into four loaves and knead thoroughly and put into tins; when light again, bake in a moderate oven, half or three-quarters of an hour.

Baking Powder Biscuits.

Having had several trials before reaching success with baking powder biscuits, I will send you the following recipe, which I know to be reliable. Sift two quarts of flour, three even tablespoons of baking powder and a little salt together. Mix in one tablespoon of butter or lard, or, better, half of each, and stir in nearly a quart of sweet milk, carefully, so as to get just enough. Knead as little as possible, roll out, cut into biscuits, and bake in a quick oven. Little kneading and quick baking are essential. MRS. J. B. POTTER.

Young Chickens and Okra.

Prepare and cut up two young chickens; put a tablespoonful of butter into a skillet and fry until brown. Then put into a kettle with a quart of finely chopped okra, four or five tomatoes sliced thin and two minced onions; just cover with boiling water and boil, or rather simmer, slowly for three hours. Season with butter, salt and pepper, and if liked, thicken with a little flour. MARY B.

Baked Egg Plant.

Pare, cut into slices of about half an inch in thickness and place in cold, salted water for two hours. Then drain, wipe with a cloth and boil until tender enough to mash like potatoes. Make very smooth, add two or three tablespoonfuls of sweet cream, salt and pepper with a little chopped parsley. Turn into a buttered baking dish cover the top with bread crumbs and bake half an hour.

Huckleberry Pie.

A friend tells us that this pie is much improved by adding a couple of sliced harvest apples to each pie. Cover the berries with the sliced apple and bake with an upper crust

E. M.

QUESTIONS ANSWERED.

Oat-Meal.

Mrs. J. B. P. asks us to give some ways of cooking oat-meal.

ANS.—*For Mush*—To three quarts of boiling water allow a teaspoonful of salt and a quart of coarse meal; stir while the meal is poured in; let it stand where it will boil gently for 10 or 15 minutes, stirring frequently; then cover the kettle closely and set on the back of the stove to swell and steam for an hour, not stirring in that time. This may be eaten with salted milk, milk or cream and sugar, or fill a saucer nearly full of the mush and press into it ripe blackberries, peaches, pears, or any fruit, and eat with cream and sugar. This makes a very nice dessert.

Oat-Meal Puffs.

To a quart of sweet milk allow three well-beaten eggs, two teacups and a half of oat-meal, one teacup and a half of Graham flour and a little salt; beat all thoroughly together and bake in hot gem irons.

Oat-Meal Cake.

To a pint of meal add enough water to make it stir like pancake batter, season with a little salt and bake in a shallow pan for 20 minutes in a hot oven.

Oat-Meal Jelly.

Put half a pint of good oat-meal to soak over night in little less than a quart of water. In the morning drain through a sieve, pressing out all of the water, and to it add one pint and a half of hot water. Season with salt, boil up quickly, then set back to simmer ten or fifteen minutes. Pour into molds, and in half an hour it will be set sufficiently to turn out into saucers. Eat with cream and sugar. The success of this dish depends very much upon the quality of the meal.

Oat-Meal Pudding.

To a quart of milk allow four tablespoonfuls of Irish oat-meal, four tablespoonfuls of flour, and a little salt. Bring the milk to a boil—using a farina-kettle or a tin pail set into a kettle of boiling water—and stir in the meal and flour made smooth in cold milk. Stir constantly for fifteen or twenty minutes, then set back for fifteen minutes before turning out. Eat with cream and sugar.

Various.

PAMPHLETS AND CATALOGUES.

WE have received the premium lists of the following fairs, in addition to the long roll published in our issue of July 5:—

Consolidated Exhibition of the Maine State Agricultural Society, the Maine Dairymen's Association, and the Maine State Pomological Society and the Cumberland County Agricultural Society, Portland, Me., Sept. 16–19. J. W. North, Jr., M. D., Sec., Augusta, Me.

Twenty-ninth Annual Fair of the Vermont State Agricultural Society and Wool Growers' Association, Montpelier, Sept. 9–11. Henry Clark, Sec., Rutland.

Thirteenth Show and Fair of the Watertown Agricultural, Horticultural and Horse Association, Watertown, Conn., Sept. 23–25. Geo. Woodward, Sec.

Annual Fair of the Onondaga County Agricultural Society, Syracuse, N. Y., Sept. 16–19. P. A. Agan, Sec., Syracuse.

Maine Agricultural Fair, Maine Village, Broome County, N. Y., Sept. 16–18. N. P. Brown, Sec.

Twenty-sixth Annual Exhibition of the Pennsylvania State Agricultural Society, the main building, Centennial grounds, Philadelphia, Sept. 8–20. Elbridge McConkey, Cor. Sec., Harrisburg.

Twenty-second Annual Exhibition of the York County Agricultural Society, York, Pa., Oct. 7–10. A. H. Glatz, Sec.

Third Annual Fair of the French Creek Valley Agricultural Society, Coebrauton, Pa., Sept. 16–18. W. A. Logan, Cor. Sec., Meadville, Pa.

Grand Exposition of the Agricultural Society of Delaware, Dover, Sept. 22–26. Richard Harrington, Sec.

Thirty-third Annual Fair and Fifth Grand Industrial Exhibition of the Muskingum County Agricultural Society, Zanesville, Ohio, Sept. 2–5. T. F. Spangler, Sec.

Twenty-seventh Annual Fair of the Lagrange County Agricultural Society, Lagrange, Ind., Sept. 24–26. Ira Ford, Sec.

Eighth Annual Fair of the Northeastern Indiana Agricultural Association, Waterloo, Ind., Oct. 7–10. J. N. Barnes, Sec.

Eighth Annual Exhibition of the Agricultural Society of Winnesheik County, Hester, Ia., Sept. 23–25. E. M. Carter, Sec.

Twenty-eighth Annual Fair of Switzerland and Ohio Counties, Agricultural Associations, East Enterprise, Ind., Sept. 9–12. W. H. Madison, Sec., East Enterprise.

Twenty-seventh Annual Illinois State Fair, Springfield, Sept. 29–Oct. 4. S. D. Fisher, Sec., Springfield. Also, Fat Stock Show at Exposition Building, Chicago, Nov. 10–15, and the winter meeting of the State Board of Agriculture.

Grand Exposition of the Minnesota Agricultural and Mechanical Association, Minneapolis, Sept. 1–6. C. H. Clarke, Sec.

First Annual Fair of Floyd County Agricultural and Mechanical Association, Charles City, Iowa, Sept. 9–12.

Twenty-second Annual Exhibition of the Marshall County Agricultural Society, Marshalltown, Ioa., Sept. 10–12. W. Brenner, Sec., Marshalltown.

Eighth Annual Fair of the Hardin County Agricultural Society, Eldora, Ia., Sept. 16–19. J F. Hardin, Sec., Eldora.

Twenty-fifth Annual Fair of the Jackson County Agricultural Society, Maquoketa, Ia., Sept. 3–12. B. A. Spencer, Sec.

Seventh Annual Exhibition of the Clake County Farmers' and Mechanics' Agricultural Society, Osceola, Ia., Sept. 9–11. W. S. Richards, Sec.

Eleventh Annual Exhibition of the Delaware County Agricultural Society, Manchester, Ia., Sept. 16–19. Wattson Childs, Sec.

Twenty-fifth Annual Fair of the Fayette County Agricultural Society and Mechanics' Institute, West Union, Ia., Sept. 9–11. C. R. Bent, Sec.

Eighth Annual Fair of the Saint Francois County Agricultural and Mechanical Association, Farmington, Mo., Sept. 9–13. T. Stam, Sec.

The thirteenth Annual Fair of the Cass Co. Agricultural Society, Plattsmouth, Neb., Sept. 17–19. J. N. Wise, Sec., Plattsmouth.

Seventh Annual Fair of the Jackson County Agricultural and Mechanical Association, Holton, Kansas, Sept. 2–5. F. M. Wilson, Sec.

Sixth Annual Fair of the Boulder County Industrial Association, Boulder, Colorado, Sept. 30–Oct. 4. C. M. Campbell, Sec.

Tenth Annual Fair of the Montana Agricultural, Mineral and Mechanical Association, Helena, Montana, Sept. 29. C. G. Reynolds, Sec.

Nineteenth Annual Fair of the Oregon State Agricultural Society, Salem, Sept. 24–Oct. 3. E. M. Waite, Sec.

Annual Fair of the Piedmont Agricultural Society, Culpeper, Va., Oct. 14–17. A. R. Alcock, Sec.

Annual Fair of the Georgia State Agricltural Society, Macon, Ga., Oct. 17–24. Malcolm Johnston, Sec., Macon.

Second Annual Fair of the North Georgia Stock and Fair Association, Atlanta, Ga., Oct. 2–26. G. W. Wrenn, Sec.

Annual Alabama State and State Grange Fair, Montgomery, Ala., Nov. 10–16. T. G. Foster, Sec.

A Summer and Fall catalogue of pot-grown and layer Strawberry plants. Also of Raspberry, Currant, Gooseberry and Blackberry plants, for sale by E. P. Roe, Cornwall-on-Hudson, Orange Co., N. Y.

Choice Strawberries (pot-grown and otherwise) and other small fruits grown and for sale by F. R. Pierson, Tarrytown-on-the-Hudson, N. Y.

Summer Catalogue of Pot-grown layer and other Strawberry plants for sale by J. T. Lovett, Monmouth Nursery, Monmouth Co., N. J.

DESCRIPTIVE Price-List of Strawberries offered for sale this summer and autumn by Ellwanger & Barry, Rochester, N. Y.

News of the Week.

MISCELLANEOUS.

Monday, August 4th, 1879.

Yellow fever is still spreading in Memphis, although the number of those liable to it is constantly diminishing. Special policemen who have been taking a census of the city reported last Wednesday that the population then remaining amounted to 16,110 out of a normal population of close upon 50,000. The whites numbered 4,283, the negroes, 11,827; adult, 10,551; children, 5,559; of these, 8,743 have had the fever, leaving 7,367 susceptible to it. At Camp Marks, close to the city 200 refugees are assembled and a much larger number at Camp Father Mathew. Two Baptist, two Presbyterian, two Episcopal and one Methodist clergymen have remained to attend the sick and well. All the Catholic priests have stuck to their posts, and two of them are dangerously ill of the plague, but their places have already been taken by volunteers from elsewhere, one of them from this city. Throughout all the neighboring country refugees from the stricken city are special objects of aversion, and in many places the shot-gun quarantine is rigidly enforced. Small store-keepers in cross-road places have raised the price of provisions, and every other kind of wares, extravagantly, as none can now be had from the Memphis market. No railroad now runs cars nearer than from 18 to 20 miles from the place, while the ascending and descending boats on the Father of Waters, in passing the plague-spot, closely hug the other shore. Much anxiety exists in the city on account of the large preponderance of colored folks and their threats of violence unless rations are distributed to them. No supplies however, are given out within the city, except to the sick; all others who need help must go to the camps to get it. This the "niggers" refuse to do, and as no business is being done in the place, much distress exists among the laboring classes. There are two companies of colored militia still in the place, and all the able-bodied whites have organized for defense. All the arms in the city have been collected from the gun-shops and elsewhere, and stored in the armory.

Refugees from there are still stricken down here and there either at their journey's end or on the way to it. There are half a dozen or more of them at quarantine here now; several deaths among them have occurred at St. Louis, Louisville, Nashville, Cincinnati, etc. The Health officers in New Orleans report five undoubted cases of yellow fever in that city. Private physicians, however, say there are at least 18 cases; but as all reported instances are isolated, the doctors do not like to put their patients and their families to the annoyances incident to such a measure and consequently fail to report cases among their well-to do patients. The disease there, too, is said to have been developed from germs left undestroyed from last year's plague. Mobile has quarantined the Crescent City already, and doubtless other places will soon follow this example. It's a sad thing, not for the afflicted region only, but for the entire country. Even already the breaking-out of the disease has contributed materially to lower the price of wheat and other products in our markets East and West, as it has paralized trade through a large section of country and threatens to do so more extensively.

The wheat market has been unusually unsteady of late. That Chicago corner of Keene and his clique has been heavily unloading the stock they have been accumulating since last October, and

this has had a strong tendency to lower prices. The danger of yellow fever spreading over a large area of the South and destroying business there, has the same tendency. Then, again, reports of very fine harvests almost all over this country are crowding in to beat down the market. The reports from Europe, too, are a trifle more favorable nearly everywhere, and especially so in southern Russia. In that region, although very heavy damage was done to crops here and there by storms and locusts, still the latest reports are that, on the whole, the wheat crop is of unusual excellence, both in yield and quality. Indeed, in view of the enormous harvest, labor is so extraordinarily scarce that hands are in demand at two and three roubles a day, and the farmers have petitioned General Todelben to allow 100,000 of his troops to aid in gathering in the crops. He has consented, but there is still a hitch in the matter, as the commanders of the troops demand for their men higher wages than the farmers are willing to pay. The matter has been referred to the Secretary of War. An average Russian wheat crop is put down at 220,000,000 bushels, whereas our crop last year ran up to 421,000,000, and this year it is now estimated at about 400,000,000 bushels, or, to be a trifle more accurate, 395,000,000 bushels. The latest estimates of the probable imports of grain by European countries are:

	Bushels.
Great Britain	120,000,000
France	100,000,000
Mediterranean countries, including Italy, Spain and Portugal	25,000,000
Holland, Belgium and North Germany	25,000,000
Denmark, Norway and Sweden	10,000,000
Total	280,000,000

It will be noticed that this is considerably less than the estimate given here last week; but our object is to keep our friends "posted" on all matters connected with their interests. Everything considered, there is mighty little doubt but that the price of wheat is bound to go up so soon as the present flurry is over. It may not rise as high as one might be justified in expecting earlier in the season, but it *will* rise. So great, however, is the uncertainty now in the wheat market, that farmers and others who are not "on the street," so as to be thoroughly posted, should be cautious in speculating in that product.

The Republican Conventions of Pennsylvania and Wisconsin were held on the 23d at Harrisburg and Madison respectively. At the former Mr. Samuel Butler, of Chester County, was nominated for State Treasurer; and in Wisconsin, Governor William E. Smith and the present State officers were renominated. The platforms adopted and the various speeches delivered were eloquent rather than precise, which speaks volumes for the heroic enthusiasm of the delegates, who evidently had a cut-and-dried task to perform. Both conventions affirmed that the United States are a nation and not a league; that the Democrats are endeavoring now to obtain by "plotting" what they lost in fight; and that the Republican party is charged with the preservation of the nation it has already saved. The Pennsylvania platform, of course, advocated the continuance of the protective tariff, a subject upon which the other body was silent. Upon the currency question there was very little frankness shown in either convention. In Pennsylvania the payment of the national debt in "coin" was favored; and in Wisconsin a resolution was passed which approved of a currency "such as we have at present." The Butler candidature for the governorship of Massachusetts is once more making things politicaly lively among the "better-than-thou" class in that State. Probably Talbot the present governor will be renominated by the Republicans, as he appears to have been a first-rate officer, while the bulk of the Democrats will be sure to support Ben, although the upper crust will be equally certain to vote for Talbot in case there is any danger of Butler's election without their support.

The returns of the foreign trade of this country for the last fiscal year show an excess of exports over imports to the amount of $264,036,602, about $7,000,000 more than last year. The day has gone by when the balance of trade is solely computed with reference to the market value of custom-house exports and imports, but this excess of the former over the latter unquestionably marks a year of extremely prosperous trade. The total value of exports and imports together was $1,156,220,894, an increase over last year of $24,313,654, the exports having increased $15,000,000 over last year and the imports $8,000,000. The imports during the year amounted to $437,051,532 and the exports to $710,428,743. This excess of exports over imports has now been in progress for four years, during which it has reached a total of $753,000,000, a sum which has been largely paid us in our bonds. During the four years before the panic the excess was the other way, the imports exceeding the exports by $423,000,000, a balance which Europe took partly in specie. This country exported $238,000,000 of coin and bullion more than it imported from 1870 to 1873, inclusive, and partly in bonds. The great mass of the exports of the country for the past year has been, as usual, confined to five articles; bread-stuffs, cotton, provisions, mineral oil and tobacco, the value of each being in the order given. Cotton and tobacco together, the two great staples of the South, exceed the bread-stuffs in value, but taking the bread stuffs and provisions together, the exports of the West are nearly 50 per cent. greater in value than the exports of the South. The chief changes in the trade of last year as compared with the year before are an increase of nearly one-third in the wheat export and a falling off in the cotton and provisions exported. The exports of living cattle have increased in the year about 100 per cent.

FOREIGN.

The Irish Agricultural Statistics Report for 1878 has just been published and is not, all things considered, a discouraging document. In the total acreage under crops there was indeed a decrease of 61,896, but the yield was better than had been anticipated. There was more than usual change in the character of the cropping, and a tendency observable to return to tillage; but still one-half of the cultivatable surface of Ireland is in grass. For ten years there has not been any very remarkable increase in the extent of grass. A decrease in crops during the same time of 25 per cent. is registered. The small holdings continue to decline in number, those not exceeding thirty acres, by 3,120 in the year, while those above thirty acres increased by 556. The total number of occupiers of land in 1878 was 531,442, having been in 1872, 541,888. The Registrar reports an increased yield of cereals in 1878, and also of potatoes, but a decrease in flax and in hay. There was a general increase in the produce of the crops. There was a decrease, however, in the number of cattle of 12,478. Taking the ten years, 1869 to 1878, cattle, increased in number from 3,733,675 in 1869 to 4,147,102 in 1873, but have again decreased to 3,985, 20 in 1878.

Germany is passing through the most serious political crisis which has overtaken her since 1866. Prince Bismarck, before the adjournment of the Reichstag on the 13th ult., formally broke with the National-Liberal party in one of his most powerful speeches, and put himself at the head of a combination composed of the Conservatives and Ultramontanes. Not only has Dr. Falk been dismissed, as a sop to the Ultramontanes, but they have been further gratified by an agreement that all money over a certain amount raised by the new protective tariff shall be divided among the separate States, which is a distinct concession to the Particularist interest. Encouraged by his success thus far, the Chancellor now proposes that the duration of the Imperial Parliament shall be extended to four or six years, and intervals of two years shall elapse between its sessions, so that the taxes will have to be voted for two years at least, thus greatly diminishing parliamentary control over the revenues. This project, which involves several amendments to the Constitution, is now before a committee, and it has filled the Liberals of all shades with dismay, and the National-Liberal party is said to be utterly disorganized. Meanwhile a settlement has been definitely come to with the Vatican, substantially on the conditions mentioned here three weeks ago.

It is a little trouble to examine the pamphlet wrapped around each bottle of the true MURRAY & LANMAN'S FLORIDA WATER, so as to find the words "LANMAN & KEMP, NEW YORK," which are water-marked or stamped in pale letters on every page, but it is better to take this small amount of bother rather than to be imposed upon by a worthless counterfeit. Every leaf of the pamphlet around the genuine has these words in in it, which, though pale and faint, can be easily seen when held up to the light, and no Florida Water is genuine that does not have this test mark

Purify the blood, Cleanse the Stomach and Sweeten the Breath with Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, August 2, 1879.

BEANS AND PEAS.—Red kidney beans are weak and the remnant of the stock will not be likely to recover with the prospect of a large crop this year. Black beans in few hands and firm. All other sorts of beans are quoted unusually alike; consequently fine marrows go the home trade to some extent in the place of mediums. Green peas are out of stock; jobbing at $2.25. Few L. E. peas remain; quoted $2 75@3 per 3 bu. bag. Canadian peas 70c. Medium beans, $1.25@1.32½c. Marrow, $1.20@1.30. Pea and W. kidney, $1.20@1.35; Red Kidney, $2.20@2 50. Black, $2.30.

BEESWAX.—There is a light business and steady prices, quoted at 24@24½c. for Western and Southern.

BROOM CORN.—Trade is slack and prices unsettled Brush and short broom, choice, ₩ lb., 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Receipts for week, 34,275 packages; exports improving, 4,100 packages for week. There is only a light volume of trade, but with the scarcity of perfect quality in creamery or other packages, best table grades are firm at full last week's rates, while extra selections may be quoted fo above our market extremes. The weather has been severely against handling wholesale lots. Very few Welsh tubs are rated fine; this fact cuts off some eastern trade. European advices indicate little margin for shippers. Western butter not plenty; some stored fine reserve has been opened and sold at full prices. Common grades of Western are going to Germany to some extent: of the exports this week more than one-half went to the Continent.

State pails and half tubs, choice, 14½@15c.; good to prime, 13½@14½c.; fair to good, 12@13½c.; firkins, yellow, 13½@16c.; Welsh, good to choice, 13@14½c.; fair, 11@12½c.; poor State, 8@9c.; State creamery, choice, 16½@17c.; good to prime, 15½@16c.; fair to good, 14½@15c.; sweet cream, 16@16½c.; Western creamery, choice, 16½@17c.; other, 14@15c.; imitation, 9@12½c.; Western dairy, best, 11½@12½c; fair to prime, 9@10c.; factory, choice, 10@10½c.; other, 7@9c.; poor, 6@6½@c.; grease butter, 4@5c.

COMPARATIVE RECEIPTS AND EXPORTS SINCE JUNE 1.

	Receipts, pkgs.	Exports, firkins.
June 1, '79 to Aug. 1, '79	342,520	63,432
" 1, '78 " " 1, '78	279,650	60,800
" 1, '77 " " 1, '77	241,075	44,645
" 1, '76 " " 1, '76	205,800	11,590

CHEESE.—Easy cable advices through the week and large receipts have caused a lower market, and the bulk of the business towards the close is at 5½c. for fancy, while fine stock is to be had at 5@5½c. The exports for the week have been 93,800 boxes

Quotations are for fancy, 5½c.; good to prime, 5@5½c; fair to good, 4@5c.; half-skimmed, 3½@4½c.; skimmed, 2@3c. State farm dairy: Fine, 5½@5½c.; good to prime, 4½@5½c.; fair to good, 4@4½c.; skimmed, 2@3c. Wisconsin factory: Fine, at 5½c.; good to prime, 5@5½c. Ohio factory: Cheddar, fine, 5@5½c.; do., fair to good, 4½@4½c.; full cream, flat, fine, 5½c.; flat, good to prime, 4½@5c.; flat, fair to good, 4@4½c.; half-skimmed, 3@4c.; skimmed, 2@3c.

Comparative receipts and exports from June 1st:

	Receipts, pkgs.	Exports, lbs.
June 1, '79 to Aug. 1, '79	873,850	40,649,150
June 1, '78, to Aug. 1, '78	1,061 800	40,202,340
June 1, '77, to Aug. 1, '77	812,250	39,934 800
June 1, '76, to Aug. 1, '76	659,600	30,138,475

Liverpool quotation, 34s.
Steam to Liverpool, 42s. 6d.

COTTON—Has been less active through the week and closed easy at for August, 11.39@11.4c.; September, 11.34@11.35c.; October, 10.65@10.66c.; November, 10.46@10.4 c.; December, 10 45@10 46c.; January, 10.49@10.50c.; February, 10.59@10.61c; March, 10.72@10.73c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples are wanted, especially prime sun dried lots, for which firm prices are made; otherwise trade is quiet; latest prices are for:

Patent evaporated apples, choice, in cases, at 11c.; do. fair to good at 9 @10c.; N. Y. State sliced, choice, at 4@5c.; do. quarters, choice, 4@4½c.; western quarters, bright, at 3½@4c.; common and old at 2@3c.; North Carolina peeled peaches at 9@10c.; do. Georgia, 8@8c.; do. fair to good at 6@7c.; unpeeled halves at 3@3½c.; do quarters at 2½@3c. Blackberries at 5c. Raspberries at 26@28c. New York State plums at 8@10c. New pitted cherries, wet, at 13½@14c.; dry at 15@15½c.

EGGS.—Receipts for week, 6,1 0 bbls.; do., last week, 7,050 do. The weather has been severe on Western, and few buyers care to handle them. Prime Canadian, State and Near points are firm, but no big prices are quoted. N J. and L. I., 14@14½c.; State and Penn., 13@13½c.; Western, 11½@12c.; choice inferior, 10@11c.; Canadian, 12½c.

FRESH FRUITS.—Apples continue to bring good prices.

Apples, red Astrachan, ₩ bbl., $2@2.50; poorer do., in bbls., $1@1.50.; Nyack Pippin, $1 25@2.75; Sour Bough, N. J., ₩ bbl. $1.50@2; Sweet do., $1.25@1.75; Windfalls, 50@75c. California grapes arrived in poor order. Cal. German prunes, 3½ ₩ box; Purple Duane, $4@4 50. Bartlett pears, $5@6; Southern Bartlett, prime, $2.50@3 ₩ crate; green, $1.50@2; other summer pears range at $1@2 ₩ bbl.; very few lines of standard variety to be counted on at this date. Peaches have had cheap range. The opening receipts of the week started rain-spotted and sales have been slow. Good stock looked for next week. Md. and Del. Hale's, 75c.@$1.25, baskets, 40@80c.; Troth's, $1.75@2.25 per crate; $1@1.50 per basket; New Jersey prematures, 30@50c., do. Apricots, ₩ quart, 10@12c.; N. C. Ives grapes, ₩ lb., 6@8c; Md. blue plums, 7@8c.; Whortleberries, 14 qt. boxes, 50@75c. Blackberries, cultivated, choice, ₩ qt., 6@8c.; other, 3@5c.; Antwerps closing up at 2@3c., third qt. ass'd. Watermelons in large supply and lower; Nonpareil, $1.6@2 ₩ 100; Va. and N. C., $4@10; Nutmeg melons, Jenny Lind, $1.75@4; Cantelopes, 75c.@$2; Hot-house grapes, 30@75c. Peanuts in full supply, quoted as before; selected shade fancy, $1.2½@1.30; extra prime, $1 25, good to prime, $1.15@1.20; shelled, 5½@5½c. Pecans, 6@8c.

FLOUR.—The arrivals of new increase, and winter wheat grades are generally favoring buyers. Spring wheat stock is not over plenty and is firm.

Latest prices: $3 90@4.50 for interior to very choice superfine state; $4.50@4.75 for poor to very good extra do., odd lots and lines; $4.75@5 for very good to choice do.; $5.90@4.40 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $4.00@4.75 for inferior to very good shipping extra do., and $4.75@5 for very good to choice extra do.; common to choice white wheat extras, $5@6.10; choice to strictly fancy do. at $6 10@6.75; red and amber winter wheat, inferior to very choice grade and family, at $4.85@6.25; round hoop Ohio at $4.50@4.90, and trade and family brands of do. at $5.00@6.00, the latter rate for choice; St. Louis, $5.25@6.00 for inferior to very good extra; $6 00@6.75 for very good to very choice (with fancy brands held higher); Minnesota clear, inferior to very fancy, at $4.65@5.75; do. "straight," very inferior to strictly fancy, $5.25@6.50, and patent poor to very choice fancy at $6.50@8 (with a few very fancy brands quoted at higher figures); unsound stock at from $3.50@5.50; city mill extra at $5.25@5.50, good to choice, for West Indies; do. for England, $4.40@4.75; do. trade and family extras, $5.75@6.75; do. for South America $5 50@5.75 for standard to choice brands (winter wheat product); No. 2 at $2.90@3.65 for poor to fancy.

GRAIN.—Wheat has declined on large receipts and crop prospects closed weak with the latest sales of No. 2 Chicago and Milwaukee spring at $1 04@1 06; New York No. 2 spring at $1 04; No. 3 spring at 94@95½c.; No. 1 white at $1 12@1 13; do. for August at $1 12½@1 12¾; do. for September at $1 12½; do. for October at $1 13; No. 2 white at $1 11½@1 12; ungraded white at $1 10@1 12½; No. 1 red at $1 10½; No. 2 red at $1 09½@1 10½; do. for August at $1 10@1 10½; do., September option, at $1 10½@1 10¾; do. early September, at $1 11; do., October, at $1 10½@1 11; No. 3 red at $1 06½@1 06½, ungraded red at 96c.@$1 10; No. 1 amber at $1 10@1 10½; No. 2 amber at $1 09@1 09½; do. for August at $1 09@1 09¾; do. for September at $1 09½; ungraded amber at $1 08½@1 09; mixed winter at $1 08½@1 10. Rye at 63c. for No. 2 Western and 68@69c. for State. Corn is lower, closing at for New York No. 2 at 44½@44½c.; do., August, at 44½@44½c.; do., September, at 46½@46½c.; do., October, at 47c.; New York York steamer mixed at 44@44½c. for car lots; do., August, at 43½c. bid and 45c. asked; do., September, at 45½c.; ungraded Western mixed at 43@45c.; yellow Western at 47c.; No. 2 white at 52@53c Oats are freely offered and prices easy; sales o New York No. 1 white at 41c.; New York No. 2 white at 38½c; New York No. 3 white at 36½c.; No. 1 at 36c.; No. 2 at 35½@36c.; No. 3 at 33½@34c.; rejected quoted at 31c.; mixed Western at 33½@35½c.; white do. at 37@40c.; white State at 38½@41c.; No. 2 Chicago quoted at 35½@36c.

HAY AND STRAW.—Receipts are larger but demand is good and prices are very regular.

New hay is at 45c. to 50c. for shipping; 65@75c. for prime, and 55@60c. for medium. Old hay at 50c. for shipping and 70@85c. for prime retail qualities. Straw at 45@55c. for long rye, 45c. for short rye, and oat at 30@35c.

HOPS.—Emmet Wells says in his circular: "The speculative fever has in a measure subsided, and the market has assumed a quieter tone. The feeling as to values, however, continues very strong, many of our largest holders being unwilling to part with their best New York State hops below 20c. Dealers are trying to contract the new crop at 18@20c., but they do not seem to meet with much success. Well-posted growers have come to the conclusion that hops will open at tolerably high figures, and this class will be likely to hold on at least until their crop is harvested and ready for market."

Quotations are for New York's new crop, prime choice, 14@15; New York's, new crop, medium, 10@12; New York's, new crop, low to fair, 7@9; Eastern, 8@11; Western, 8@11; Yearlings, 4@7; Olds, all growths, 3@4 Pacific coast, nominal 10@14.

OIL-CAKE.—Western is quoted $28.50 per ton.

POULTRY AND GAME.—Prices for live fowls and chickens have declined under large supplies. Havanna shippers are using some, but there is considerable unsold stock.

Chickens, large per ₩., 14@17c.; small, 12@13c.. fowls, N. J., 12½c.; Western, 12@12½c. Southern, 11½@12; roosters, old, 6@7c.; ducks (most of them are too young for market), ₩ pair, 45@75c.; others, 40@60c.; geese, best, $1.37@1 62; others, $1@1.25. Turkeys, lb., 11@14c.

The least surplus of dressed this hot weather tames prices.

Turkeys, Phila., dry-picked, 14@15c., State and Western, 13@14c.; chickens, Philadelphia, per ₩, 15@18c.; State, 15@16.; Western, 14@15c.; fowls, choice, ₩ ₩., 13@14c. other, 11@12c.; dry-picked, 14@15c.; ducks, spring, dry-picked, 15c.; other, 10@13c. Woodcock open at 70@75c. for State and 60@70c. for Western. Ice-house Eng. snipe, $2.25.

TOBACCO.—A strong market prevails and a good trade.

WOOL.—There has been a fairly steady market the past week, and more doing.

Sales of X, XX and No. 1 Ohio at 38@41c.; XX do. at 39c.; No. 1 Penn. at 40c.; State at 34@35c.; unwashed Indiana at 30@33c; scoring California at 21½c; do. at 24@25c.; scoured do. at 56@58½c.; scoring Texas at 20@28c.; do. at 19@21c.; fall do. at 15@17c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 2.

BEEVES.—Receipts for the week, 11,416 head; do. last week, 14,061 do. There was a steady trade at Jersey City and at 50th St., N. Y., for a few instances cattle sold ¼c. higher than on Wednesday, but at the close further receipts depressed the feeling, and the market closed tame. Decent Texan steers, 6½c., dress 55 lbs.; dry cows, 7@7½c., dress 52@54 lbs.; ordinary to extra native steers, 7½@7¾c.

VEAL CALVES.—Market quiet, demand chiefly for fancy. Extra New Jersey, 6c.; fair to prime, 5@5½c.; poor, 3@4½c.; buttermilk, 3½@3½c.

SHEEP AND LAMBS.—Receipts for the week, 25,089 head; do. last week, 30,477 do. Market quiet for both export and local use. Common to good sheep, 3½@4¾c., and 4½@6½c. for lambs, the latter for a few choice N. J.

COWS AND CALVES.—Receipts heavy; 200 head were worked off at the range of $25@55; very few, however, at the outside.

HOGS.—Receipts for the week, 14,940 head; do. last week, 13,710 do. Light demand at $4.10@4.30 for Ohio; $4.20@4.40 for State; city dressed, $5.25@5.75.

KITES.

A SMART little fellow had hoisted a kite
In a street of an overgrown town,
The higher it flew, more intense his delight;
His cheeks became rosy, his blue eyes more bright,
'Twere useless to seek for a lovelier sight
In the streets of an overgrown town.

Like a bird in the air, the paper toy flew,
To the right—to the left—up and down.
Among the observers were more than a few
Who wished that themselves could their childhood renew;
But no wishes the past of our lives can undo,
In country, or city, or town.

That smart little fellow is smiling no more
In the street of that overgrown town.
A telegraph wire the street passing o'er
Has entangled his "tails," and no skill can restore—
The toy that so gaily had fluttered before
Now hangs with its head drooping down.

Perchance some old fellows who've traded with kites
In the streets of that overgrown town
And dazzled the public with wonderful sights,
The sensations of days, the illusions of nights,
Have been caught by their tails, and in pitiful plights
Now hang with their heads drooping down.

TWO STICKS.

ALICE P. ADAMS.

DOLLY had a penny and was going down town. Now, any one who knew Dolly would understand directly what that meant. But you little people, whose bright eyes never saw our curly-head, might guess a great many times before you suspected her motive.

Dolly intended to buy a stick of licorice candy. This was her favorite of all confections. To be sure she never would refuse caramels, cream-drops, taffy, or even hoarhound, for she was a great lover of sugar-plums; but when she spent her own pennies she usually inquired for "lickerish candy." Indeed, so much of Dolly's money went in this way, that mamma never gave her the penny for the missionary box until just before she started for Sunday-school. Mamma believed, you see, in "leading not into temptation."

This afternoon Dolly made up her mind that she would not patronize Mr. Hoffman as had invariably been her custom heretofore, but concluded to try the new shop across the street; "for p'r'aps the sticks will be longer or thicker than those I always get at Mr. Hoffman's."

A pleasant-looking young man stood behind the counter of the new shop. Dolly went in, and laying down her penny, asked, "Have you got any lickerish candy?"

"Yes, loads of it," said the clerk, taking down a glass jar. The sticks were of the regulation size, neither longer nor thicker than at the old store. But a bright idea struck Dolly; looking up at the tall young man on the opposite side of the counter, she said archly, "H'm, if you have such loads, you may give me *two* sticks!"

The clerk laughed, and took out another piece, twisted the two in pink tissue paper, gave the parcel to Dolly, who bestowed the same in her diminutive pocket, and walked exultingly out of the shop.

She walked, but it was only because her mother did not allow her to run when she was down-town; after the last store was passed, however, she commenced to hippity-hop, and, finally, felt obliged to run, so anxious was she to tell her cousin Sue of her good fortune.

"Two sticks for a penny! How cute you were!" cried Sue, admiringly. "I wish I had one! But then I don't b'lieve the man would do it again."

"No, I don't either. Not so soon, anyway. But I'll give you half a stick, and then I must go home, or mamma 'll wonder what has become of me."

Dolly told the story again at the supper table, thinking to gain still greater applause for her smartness. Papa's eye twinkled and the big brothers laughed, but mamma's face was very sober as she said, "I didn't think that my little girl would be so rude."

"Why, I didn't know that was rude, mamma," said Miss Dolly, somewhat abashed, for she always felt injured if anyone was impolite to her.

"It was very rude. And you must promise me, Dolly, never again to ask a store-keeper to give you more than the worth of your money; otherwise, I can not allow you to go by yourself when you buy candy."

"Oh, I'll promise, mamma;" then she added, while a smile dimpled her cheeks, "But I can't help being glad that I got *two* sticks this time!"

San Angeles, Cal.

HINTS FOR THE CLUB.

Exchanging Plants.

QUITE a number of the members of our Club have suggested that the cousins should exchange plants, seeds and other objects of interest with one another. At first thought this seems to be a very excellent idea. Boys and girls who are interested in collections of any kind, botanical or general, could thus exchange the curiosities found near their homes for others found in sections of the country where they are not acquainted. Thus a boy living in Massachusetts or New York might exchange with others in California, Texas or Florida. No doubt this would be very instructive, but the plan has some serious drawbacks, which have prevented me from encouraging the scheme. In the first place, it would be necessary to publish the addresses of all the members with an account of what each had to offer, and what he or she would wish in return. Aside from the fact that such publications would take up a great deal of valuable space in the RURAL, the cousins would soon find that their cousin friends are not the only persons interested in knowing their addresses. They would be beleaguered by showers of circulars, papers and proposals of all kinds from unscrupulous humbug dealers, who, in persuasive language, would make them the most tempting offers to buy this, that and the other thing, and, of course, swindle them wholly, or in part, out of their money.

Secondly, there would be much dissatisfaction with the transactions among the cousins themselves. Some would send off their nice specimens and be disappointed with those they received in return, while some packages would be lost in the transit and fail to come to hand at all: and ultimately they would lay the blame at the door of the RURAL or of Uncle Mark (and with some degree of justice, too,) for having been the means by which their disappointments were wrought. We have tried this exchanging plan before and know it to be impracticable.

Soil for House Plants.

All of my nieces and nephews who keep house plants (and I hope they all do), must provide some soil in which to grow them, and the present is a favorable time in which to gather it. You must not expect that all kinds of plants can thrive in soil dug from the field or garden and mixed with nothing else. Such soil nearly always lacks vegetable mold, or it is too sandy, too clayey, too poor, or something is the matter which unfits it for pot-plants. The secret of success in growing house plants consists mainly in placing them, as nearly as possible, in conditions similar to those under which they flourish in their native countries. Thus it would be wrong treatment to plant a Cactus that thrives only on the dry, sandy plains of Mexico, in a rich mixture of leaf mold and manure, and keep it soaked with water; or, on the other hand, to set a plant that grows in a rich humus in a very sandy soil.

Leaf mold is a soil that every plant grower should always have on hand, and those who have none should lose no time in getting some. Go into the woods with a horse and cart, and in some convenient place rake away the leaves and with a shovel scrape up the layer of the black, rich mold, which will be found underneath. When a sufficient quantity has been brought home, it should be placed under a shed, or in a cellar, where it will not be overgrown with weeds.

Another soil which is indispensable for pot-plants is the loam formed from decaying sods. To get this, cut sods about two inches deep, from an old pasture, and pile them up in a heap with the grass downward, where they should remain till they are thoroughly decayed. The decomposition may be hastened by turning the heap over occasionally after the first three or four months have passed. Some old, fine-pulverized manure, should also be kept on hand, to mix with the soil for plants that are wanted to grow vigorously.

There is still another material which, in nearly all cases, should be mixed in greater or smaller quantities with the soil for pot-plants; it is sand. Young plant growers, and some old ones as well, do not realize of what value sand is when rightly used. It may be obtained from sandy river bottoms or creeks that are dry at the present time, or from places where it has been washed together by heavy rains. If it is dug out of a pit, it should be washed and exposed to the air for two or three months before it is used. UNCLE MARK.

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE:—For a long time I have had a great desire to join the Horticultural Club. Your invitation extended only to the young people, and it puzzles me to know how old a person may be and yet be classed among the "young people." I am a young farmer's wife, twenty-two years of age, and if you have a corner for me I would be very much pleased to become a member. I have some thirty varieties of flowers in our yard, which I cultivate and care for with a great deal of pleasure. Among them is a bed of Pansies, now in bloom, from seed sown in May. If you see fit to accept me as a member, I will report with pleasure of my success or failure. Your niece,

Broome Co., N. Y. NELL.

[I much prefer to be excused from giving a decision in so delicate a matter as to what age a lady may attain and still be classed among the "young people;" suffice it to say that Nell is cordially welcome to join the Club, especially as she is a cousin whom I remember having heard from on one or two other occasions.—UNCLE MARK.]

DEAR UNCLE MARK:—My garden did very well till harvest, then I had to bind wheat for six or seven days, and the weeds came very near getting ahead of me, and it took hard work to clean it out. I have only two kinds of flowers, Zinnias and Gladioli. I have to fight the cabbage worms to save my cabbage. I don't put anything on them; I pick them off and kill them, and I also kill all the white butterflies that I can catch. One year we put buttermilk on the cabbage to keep the worms away and the heads decayed. I am raising an acre of corn and a half acre of potatoes for pocket-money. I forgot to give my address the other time I wrote, so I did not get the radish seed and sweet corn, and now I give it below.

Clark Co., Ohio. SAMUEL SHULL.

UNCLE MARK:—Please accept my thanks for the seed you sent me. The Gladiolus, radishes and Dolly Dutton corn are all doing nicely. My garden is doing very well this year, except the seed we got from the RURAL. The Beauty of Hebron, Hollyhocks, Hibiscus, Aquelegia and tomato were all that came up.

I second the motions that have been made by several members of the Horticultural Club about exchanging plants and seeds.

Uncle Mark, will you send Prof. Gray's "How Plants Grow" as a premium for new subscribers? And if so, how many? From your niece,

Cross Creek Village, Pa. BELL PRIMROSE.

[We will send "How Plants Grow" for three new subscribers.—U. M.]

DEAR UNCLE MARK:—As so many of the boys and girls have joined the Horticultural Club, I thought that I would like to join, so please put my name on your list. I have a nice flower garden, and am a great lover of flowers. We have taken the RURAL for many years, and this year my brother takes it also. I like it very much, and I love to read the letters from the cousins. But I must close now, otherwise you would not want me to write again. LILLIE BABCOCK.

Norfolk, Va.

The Puzzler.

HIDDEN TOOLS.

1. Robert, row Ella's boat.
2. I heard a wren chirp.
3. Pinch Ersie's hand.
4. Bob, it seems hard.
5. The parsnip perspired.
6. Hand me the ferule, Richard?
7. I gave Lewis my handkerchief.
8. A steel yardstick is too heavy.
9. Don't tax Levi.

MAGAZINES.

APPLETON'S JOURNAL FOR AUGUST.—Contents: The Seamy Side, a novel, by Walter Besant and James Rice, chap. x. to xii.; A Cornish Saunter, D. C. Macdonald; Wandering Thoughts about Germany; Out of the Depths, a story, S. G. W. Benjamin; Reminiscences — Patrick Branwell Brönte—Leigh Hunt and his Family, Francis H. Grundy; Wordsworth, Matthew Arnold; The Comedie-Francaise; The Mirabeaus, Jas. Cotter Morison; Schopenhauer on Men, Books and Music; Moose-Hunting in Canada, Earl of Dunraven; Poems by Theophile Gautier; Editor's Table; Books of the Day.

THOUGHTS ABOUT GERMANY.—Nowhere else, probably, in Europe are the mediæval and the modern spirit, the spirit of authority and militarism, and the spirit of industry, to be found ranged against each other in such force. Nowhere else is an aristocracy, feudal in ideas if not in power, confronted so directly by a proletariat leavened with the ideas and aspirations which the late Pope summed up under the term "the Revolution." And therefore those who are fostering the military spirit and painting up the regiment and the battalion before the civil organization are, in fact, sitting on the safety-valve, purchasing present force and movement at the cost of an imminent explosion. The desire of all who believe in the future progress of the race should be that, without any great convulsion or cataclysm, modern ideas may, as men are able to bear them, supersede those of barbarism and feudalism; that the age of armies and privileged classes may pass—as it must pass—peacefully and gradually into the age of free industrial development and equal rights. In France, indeed, the accumulated evils of many generations had so wrought themselves into the very life and system of the nation, that they could not be driven out without a terrible paroxysm of revolution; but in Germany, the mother of inquirers and thinkers, it might be hoped that the change should be a peaceful and a natural process. If, however, the present apparent predominance of the military spirit is more than a mere passing symptom, if Germany is to continue to be, in the happy phrase of M. Renan, "crushed beneath the weight of her own armor"—if, instead of fostering industry and commerce, the ruling classes are bent upon developing the present system of bloated armaments and of unproductive expenditure of the people's earnings upon guns and drums and villainous saltpetre—then it can hardly be doubted that a terrible day of reckoning will come at last, and that the force of the ultimate explosion will be in proportion to the weight of repression. In truth, the present policy of Europe seems calculated to force on the question whether, after all, smaller States are not better suited for the growth and maintenance of liberty than these vast and sometimes heterogeneous empires which it has been the work of modern Europe to pile up with much labor and to cement with much blood. Setting aside Great Britain, as having her boundaries fixed for her by nature, and Austria as an altogether abnormal and portentous growth, it may fairly be questioned whether, for instance, the unification of Germany will have been a benefit or an injury to Europe, if it causes her, by maintaining a vast military establishment, to crush her restless masses into despair, and to keep her neighbors' armaments at their present overgrown scale. It is at least among the possibilities of the distant future, that a federation of small republics, united closely for purposes of defense and of commerce and intercourse, but otherwise independent, may take the place of the enormous monarchies which now overshadow Europe. —*Appleton's Journal for August.*

THE CHILD-LIFE OF GOETHE.—About this time occurred an amusing incident, which came near being serious for Papa Goethe. There was in Germany then a young poet, named Klopstock, who wrote a poem called "The Messiah." It became famous throughout the country, and everybody read it and talked about it. Papa Goethe read a little of the poem, and then he said it was good for nothing, because it was written in blank verse, and he would not allow his children to read such stuff. But some friend smuggled the book into the house, and the children were in raptures over it. They not only read and reread the poem until they knew a great deal of it by heart, but they would declaim passages to each other. Now, one Saturday, about twilight, the barber came, as usual, to shave Papa Goethe. This was done in the sitting-room, and the children were there behind the large porcelain stove, and no one noticed them. In low tones they declaimed to each other their favorite dialogue from "The Messiah" while the barber lathered their father's face. Cornelia, becoming excited with her part in the dialogue, forgot where she was, and cried out in loud tones:

"Help me I implore thee! And even if thou shouldst demand it,
Monster, I pray thee! Abandoned One, blackest of sinners,
Help me! I suffer retributive pains as of death everlasting.
With the fiercest and grimmest of hate I would hate thee beforetime.
I am powerless even for that! This is deep, unapproachable anguish——"

Soon, seizing her brother's arm, she fairly shrieked,

"Oh! how I am tortured——"

The poor barber, who knew nothing of Klopstock's "Messiah," and believed some creature to be wailing in mortal agony, was frightened nearly out of his wits; and poured nearly the whole basin of lather down the ruffled shirt-front of Papa Goethe! Then there was an uproar. The small offenders were drawn out from the shelter of the friendly stove, and Cornelia was asked, in an awful voice, what she thought would have happened on account of her bad behavior if the barber had had a razor in his hand instead of a basin of lather. Cornelia was very sorry, and greatly shocked, and confessed the reading of "The Messiah." This made the matter still worse: but fortunately, Papa Goethe found so much fault with the poem that he had not much breath left to scold the children, and contented himself with insisting that the book should be sent out of the house.

All that has been told here gives but a brief glimpse of the wonderful child, Johann Wolfgang Goethe. He entered college at Leipsic when he was sixteen years old, and then Goethe's child-life may be considered closed.

But the whole story of his after life is deeply interesting. It seemed as if he had only to attempt a thing to excel in it. He was distinguished in athletic sports and college pleasures, and was considered one of the most graceful skaters in Germany. He was beautiful in appearance, a favorite in society, brilliant in conversation, a good friend, loving and lovable, a great student, and an original thinker.—*St. Nicholas for Aug.*

PERSONAL ITEMS.

An aged woman at Windsor Locks, Conn., died at a picnic which was given in her honor.

The Rev. Thomas K. Beecher, of Elmira, is trying to organize a stock company to build a furnace for the cremation of human remains.

Charles Gambetta, who claimed to be the uncle of M. Gambetta, has just died in an alms-house at Milan, aged 81. He had squandered a considerable patrimony.

Sitting Bull was named, according to Joaquin Miller, because, being shot through the legs in battle, he sat upright, and continued to fight with the fierceness of a wounded buffalo bull.

John B. Gough is in his 62nd year, has traveled about 420,000 miles and delivered nearly 8,000 lectures within the last 37 years, and yet he has not been in bed a whole day from illness since 1846.

George Ticknor Curtis very satisfactorily disproves the story about a natural son of Daniel Webster said to be living in Chicago. He shows that not one of the statements made by the claimant can be true.

Three letters, from Napoleon III., Eugene and the Prince Imperial, sold at a London auction the other day for $100. That from the Prince was an affectionate note, in English, in which he says: "I love you with all my heart."

On his elevation to the purple Cardinal Haynald Bishop of Kolocza-Baes, Hungary, gave 20,000 francs as the nucleus of a fund for aged priests and teachers. Mgr. Haynald is one of the most famous of living botanists.

It is reported that the ex-Khedive of Egypt has arrived at Naples, with his four wives, two sons and 225 other members of his household and suite. If he can find a residence at Naples large enough to accommodate him, he will arrange to remain there for the present.

It is denied that Princess Beatrice was engaged to be married to the ex-Empress's unfortunate son. "That the illustrious young lady sincerely and unaffectedly mourns the poor Prince," says a foreign journal, "is perfectly true; we all lament the loss of a dear friend."

The Rev. Dr. Leonard Bacon says of the fresh controversy between old and new school Presbyterianism; "Has it broken out again—that old conflict between the Gospel of a free salvation offered to all men and the petrified foundation of Calvinism as it was shaped by Calvin's successors?"

Adam Helmer of Port Huron, Mich., got out of bed, armed himself with a gun, and went down stairs to hunt a burglar. His wife arose immediately afterward, and stole on tiptoe down another stairway. They came together in a dim light, and Helmer, mistaking his wife for a burglar, killed her on the spot.

Victor Hugo talking about age not long ago confessed that the most disagreeable advance to him was that from thirty-nine to forty. "But," said a friend, "I should think it a great deal better to be forty than fifty." "Not at all," replied Hugo; "forty years is the old age of youth, while fifty years is the youth of old age."

John Brown, Jr., sees many changes in Kansas. He called on the Topeka Commonwealth a few days ago. He was in Topeka in 1856, and now says that he can't recognize a single landmark. In that year he was a prisoner, with Governor Robinson and other Free State men, and now, twenty-three years afterwards, visits the same State in the interest of the same race.

Highwaymen stopped Bernard Southwick on a a lonely Indiana road, and demanded his money or his life. He fought with exceeding vigor and valor, bruising his assailants seriously with a club, and was vanquished only after a quarter of an hour of desperate resistance. On searching his pockets, in the expectation of getting valuable booty, they found exactly eleven cents.

Mr. Calvin, a Cincinnati German, wooed a Jewess in vain, and inferred, from what she said, that if he was a Jew she would marry him. So he went through with all rites required of Gentiles who embrace the Jewish religion, and, after this ordeal, again presented himself as a suitor. But the maiden still declined his offer, and he is convinced of her entire heartlessness.

Mr. Kemp, a fashionable summer resident at Brighton, England, was sued by a milliner for pay for a large amount of finery that his wife had bought. Mrs. Kent testified in court that she did not know what she was doing when she purchased the goods, having drank a tumbler of gin a short time before, and the jury gave a verdict for the defendant, stipulating that the things must be returned.

John Baker was indicted for murder in Guadalupe County, Texas, and released on bail. He employed his liberty in attending religious services, and became a real or pretended convert. He went to a Methodist camp meeting, and was addressing the congregation, when a rifle ball penetrated his brain, and he fell dead. Some friend of his victim had fired from a distance with unerring aim.

The representative of the heir of the great Henry Clay was in Boston last week to negotiate the sale of the famous Clay vase, bought by the generous contributions of the enthusiastic Whigs in 1844. About everything else has gone for the benefit of the young spendthrift, and now this testimonial to his grandfather is put in the market. The vase is of solid silver, two and a half feet high and elaborately fabricated.

When Mlle. Eugenie de Teba was first presented to the then President's court, she was remarkable, though a Spanard, for an English rather than Spanish style of beauty. Bright golden hair, blue eyes, soft pink complexion, and an expression of the gentlest dignity and sweetness were the characteristics of the future empress. The wedding was celebrated at the Hotel de Ville and Notre Dame early in 1853 with extraordinary pomp, the ceremonial which had been observed at the wedding of the first Napoleon and Marie Louise being adopted from point to point.

Dean Stanley relates that during the conduct of a cause by the late Lord Lawrence for a young Indian Rajah, the latter endeavored to place in his hands under the table a bag of rupees. He answered at once: "Young man, you have offered to an Englishman the greatest insult he could possible receive. This time, in consideration of your youth, I excuse it. Let me warn you, however, never again to commit so gross an offence against an English gentleman."

Bishop Colenso, who is now 65 years old, is described in the London World as a handsome, stately old man. He has a massive head, crowned with abundant silvery locks; a mobile mouth, with strongly-marked lines of incessant study and much care about it; deep-set eyes, pathetic almost in their kindly and earnest expression; a stature far beyond the average, and a presence at once dignified and simple. His home at Pietermaritzburg is a long, low, cosy house, planted amid the most beautiful scenery.

"Plon Plon" has long been the dread of all parties in France. When this reproach once met his ears from the lips of the late Emperor he smiled grimly and stretching forth his arms to every corner of the compass, declared that "not France alone, but the whole universe would proclaim itself of his party when the proper time came." He believes in a great socialistic republic, with a more equitable distribution of worldly goods, a division of territory among the poor, and a limitation to the property of the rich.

Aaron Smith led a mob that hanged George Moore, at Carlisle, Ind., and was complimented by his comrades for his boldness in that outrage. A few nights afterward, a party of fun-loving young men dragged him out of his bed, put a rope around his neck, and told him that his death hour had come. They would have been puzzled to answer if he had asked them what he had done to displease them; but, to their astonishment, he confesssed numerous thefts, and abjectly begged for mercy. He is not the popular man that he was before this trial of his qualities.

Frederick Maleh, a murderer, ventured from his hiding place in the woods to his home at Wilberton, Ill. He feared the officers of the law less than he did his neighbors, who, as he knew, would like to lynch him. Hungry and fatigued, however, he had resolved to take the risk of this visit. It was night, and, after eating a hearty meal, he lay down on a bed to sleep, first placing a loaded gun within reach, and stationing his wife at a window to keep a lookout for lynchers. He had not slept long before she awoke him to say that mounted men were approaching. He unhesitatingly shot himself through the heart.

When General Getty, commander of the garrison at Fortress Monroe, received Captain Wise and the Richmond Blues with a band of music, at Old Point, the other day, as soon as the music struck up it frightened the team of a countryman, consisting of a runt of a bull hitched to a stick cart, to such an extent that he ran into and demolished the entire command. When order had been somewhat restored, Captain Wise wittily remarked to General Getty: "Another Bull Run, General." "Yes," replied the General, "a regular rout; but I promise you when you get inside the fort you shall fare better than at Getty's-burg." And they did.

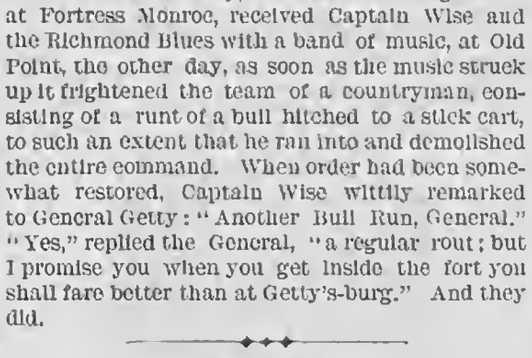
Implements and Machinery.

Attention, Owners of Horses!

THE ZINC COLLAR PAD Is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-stopped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO., BUCHANAN, MICH.

COMBINATION GRAIN SEPARATOR.



Ten years in advance of all others.

The vital portion of the vibrating device is perfected by the combination of Picker and Open Rake attached, thus it has the vitals of both Apron Machine and Vibrator.

The Friends of Each Style Agree to its Perfection.

Straw subjected to Three Distinct Motions. No parts to break or get out of order. Simplicity, ease of draft and quantity of Work. Best Cleaning Mill ever made.

EACH SEPARATOR TESTED BY MACHINERY.

MACHINES FOR

Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by

A. W. GRAY'S SONS, Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Circulars and Price Lists free. Address as above.

MEDAL MACHINES.

New York State Agricultural Works.

1st Premiums at all Competitive Trials.

New Publications.

The Voice of Worship,

For Choirs, Conventions and Singing Schools.

BY L. O. EMERSON.

This splendid book is now nearly through the press, and will be in great demand. Full collection of the best Hymn Tunes and Anthems for Choirs, numerous Glees for Social and Class singing, and a good Singing School course. Its attractive contents, with the low price ($1.00 or $9.00 per dozen), should make it the most popular of Church Music Books.

THE TEMPLE. *For Singing Schools, Conventions and Choirs.* By W. O. PERKINS, will be ready in a few days. First class book for Singing Schools, with large collection of Glees, and plenty of Hymn Tunes and Anthems. Price $1.00 or $9.00 per dozen. Although Singing Classes are especially provided for, both the Secular and Sacred Music render it one of the best Convention and Choir Books.

FATINITZA. The new and very favorite opera, is now ready, with words in three languages, all the Music and Libretto complete. Price $2.00 paper, $2.25 boards.

PINAFORE. Price reduced to 50 cts. The same elegant edition heretofore sold for a dollar. Complete Words, Libretto and Music. All ready for the stage.

Any book mailed for retail price.

OLIVER DITSON & CO., Boston.

UP SHE RISES, AND

DOWN HE GOES.

Wit and Humor.

A BAD little boy calls himself Compass, because he is boxed so often.

IF anybody should ask you the nativity of "Old Sol," you can say he is an high-burn-ian. —*Detroit Free Press.*

"I say, my little son, where does the right hand road go?" "Don't know, sir; 'taint been nowhere since we lived here."

SCANDAL mongers may learn this lesson from the frog: Once overpassed the season of his adoleseence he gives up tail-bearing.—*Yonkers Gazette.*

A COUNTRYMAN tried to buck against a deseendant of Ham. He now says, "Off with his head, so much for bucking Ham."—*North American Review.*

IT is a great piece of folly for a man to be always ready to meet trouble half way. If he would put all the journey on trouble, he might never meet it at all.

NEWLY married husband: "This is a friend of mine, my dear—a friend of twenty years' standing." His bride. "Good gracious: Then pray give him a seat, for I am sure he must be tired."

AN editor being asked. "Do hogs pay?" says a great many do not. They take the paper several years and then have the postmaster send it back marked "refused."—*Boston Post.*

A YOUNG man went into a restaurant the other day, and remarking that "Time is money," he added that, as he had a half-hour to spare, if the proprietor was willing, he'd take it out in pie.

A WOMAN raised to the third power of widowhood has the photographs of her three departed lords in a group, with a vignette of herself in the center, and underneath is the inscription, "The Lord will provide."

THE New York Independent relates that a girl who had been very observant of her parents' mode of exhibiting their charity, being asked what generosity was, answered: "It's giving to the poor all the old stuff you don't want yourself."

THE peculiarity of the fly is that he always returns to the same spot; but it is the characteristic of the mosquito that he always returns to another spot. Thus he differs from the leopard which does not change his spots. This is an important fact in natural history.

ANY father who would go out and put tar on top of his front gate after dark, must be lost to all sense of humanity and ordinary respectability.

It is unnecessary, too; they'll stay there long enough without being stuck there.—*Boston Post.*

A DETROITER cured a long and severe attack of neuralgia by falling down stairs. That's nothing. Some years ago a Norristown youth was cured of a bad habit of swearing by falling off a cherry tree. Not a single oath has escaped his lips since. The fall broke his neck. —*Norristown Herald.*

AN art critic going into a gallery in a state of mild inebriation, to criticize some pictures, sees himself in a glass, and, taking out a notebook, writes as follows: "First room, head of a drunkard, no signature, has a great deal of character; red nose remarkably truthful. Must be a portrait from life; think I have seen that face somewhere."

AN inveterate old chicken thief in Alabama, who had a marvelous faculty of gliding out of a close corner, was at last caught in a close corner with a chicken in his hat. He denied the stealing of it, and on being asked how then it got into his hat, he solemnly said: "Dat, marster, is jes' what 'stonishes me; but fo' de Lord, I spec's it mus' hab crawled up my breeches leg!"

AN old-fashioned minister passing a fashionable church, not long ago, on which a new spire was going up, was asked how much higher it was to be. "Not much," he answered; "that congregation don't own much higher in that direction." Too often the hight of the steeple is the hight of the church's ambition, and all below it belongs to the sheriff and the creditors.

"THIS, dear children, is the shoe of a Chinese lady; see how little it is; what a very narrow sole it has." "I'll bet it aint as narrow as Deacon——'s. Father says his soul will fall through a crack in the floor some day and get lost," was the shrill comment of a boy given to sharp listening. The Superintendent put the Chinse shoe in his pocket and requested the school to sing "Pull for the Shore."—*New Haven Register.*

OLD MADAME ROTHSCHILD, mother of the mighty capitalists, attained the age of ninety-eight years. Her wit, which was remarkable, and her intellectual faculties, which were of no common order, were preserved to the end. In her last illness, when surrounded by her family, her physician being present, she said in a suppliant tone to the latter, "Dear doctor, try to do something for me." "Madame, what can I do? I can't make you young again." "No, doctor, I don't want to be young again, but I want to continue to grow old."

A PRETTY little girl, in whose cheap and plain dress the child of a laborer could be recognized, contemplated, in company with her mother, the rich show-window of a toy store on the Boulevard. Her mother, pointing at the biggest and most richly dressed of the dolls, said: "You would like to have that, wouldn't you, Louise?" "Oh, no, mamma, not that one; it's too well dressed for me." "And what difference does that make to you?" "Why, I'd want to be my dolly's mamma, and not her servant-girl."—*French Newspaper.*

Those Useful Conduits,

The kidneys and bladder, sometimes become torpid and weak from unascertainable causes. When this occurs, their discharging function is of necessity very imperfectly performed, and certain debris, which is the result of natural bodily waste and decay, does not escape as it should, but remains to corrupt the blood and develop poisonous humors and dangerous as well as painful diseases. It is one of the benefic nt effects of Hostetter's Stomach Bitters to gently stimulate the urinary organs, and prevent them from lapsing into a state of inactivity, always provocative of their inflammatory degeneration and decay. How much better, then, is it to adopt this mild diuretic as a means of inciting them to action, than to incur the danger of this destruction. To expel from the system waste matter through the bowels and kidneys, and to regulate and arouse the stomach and liver, are among the chief uses of this valuable remedy.

CHEAPER THAN HOME-MADE,
AND NOTHING MORE SIMPLE.
BONES OF ANIMALS DISSOLVED IN ACID.
BAUGH'S AMMONIATED DISSOLVED ANIMAL BONES.
This article has been used for years by many of our leading farmers with excellent results, and is now one of the most popular brands we make. Price low.
☞ In view of the risk and cost of transporting acid in carboys, this article of Dissolved Bones presents great advantages to those farmers who have been making their own phosphates on the farm.
Circulars furnished on application. All *Fertilizing Supplies* at the lowest market prices.
BAUGH & SONS, Philadelphia, Pa.

STRAWBERRIES
Newest and Best Varieties,
INCLUDING
"SHARPLESS"
Grown in Pots and ready for shipment now. New descriptive priced catalogue and a colored plate of Sharpless FREE. Address
ELLWANGER & BARRY,
Rochester, N. Y.

20 ACRES STRAWBERRIES.
All the best sorts. Potted Plants, Layer Plants. Catalogue free. Address JOHN S. COLLINS, Moorestown, N. J.

1,000,000 SHARPLESS Strawberry Plants, pot grown or from open ground. Noted for its *great vigor, productiveness, large size, and best quality for market and family use.* Get plants direct from Central Pennsylvania, "the home of the Sharpless," and be sure they are genuine. Descriptive Price-List of this and other varieties free.
J. L. DILLON, Florist, Bloomsburg, Pa.

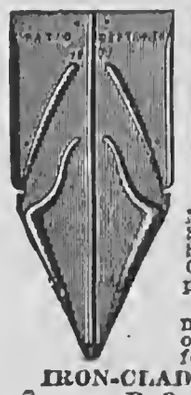
Pot Grown | **STRAWBERRY PLANTS.**
Sharpless and President Lincoln, $4 per 100.
Send for Price-List of 24 varieties.
WILLIAM H. MOON, Morrisville, Pa.

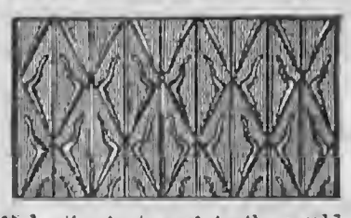
STRAWBERRY PLANTS.—A choice stock of Old and New varieties at moderate prices. Descriptive List sent free to all applicants. Address
P. M. AUGUR & SONS, Middlefield, Conn.

POTTED STRAWBERRY PLANTS.
Pot grown Strawberry Plants are the best; experience confirms this. All our customers who have planted them say, they would plant no others. 12 selected kinds from a large collection, comprising the best of the old and new kinds. Send for circular and directions for cultivation.
F. R. PIERSON,
Tarrytown, New York.

LANE & BODLEY CO.'S
CINCINNATI
FARM ENGINE.
The best, the cheapest, most efficient and durable Engine in the market. Every Engine is tested and diagram cards taken before shipment, and every Boiler is insured for *one year.*
Our Engines will give from 25 to 33⅓ per cent
MORE POWER
With the same amount of fuel and water, than many of the engines now in the market. Send for our catalogue and prices.
LANE & BODLEY CO.,
JOHN AND WATER STS.
Cincinnati, O.

METALLIC SHINGLES.
Gold Medal Awarded at Paris Exposition, 1878,





Make the best roof in the world. Superior to Tin. Cheaper than Slate, and less than ¼ the weight. Cannot Crack. Fire Proof. Can be put on by any Carpenter.
75 per cent. saved in freight, with no breakage in carriage or putting on. ☞ Will last a life-time. Send for full description and prices to the
IRON-CLAD MANUFACTURING CO.,
P. O. Box 2528, New York City.

JOHN J. SCHILLINGER'S
PATENTED FIRE-PROOF FRAME HOUSE
Also manufacturer of fire-proof Composition, Partition, Furrings and Ceilings.
Arched fire-proof construction without beams for brick-houses.
Patentee of the SCHILLINGER Artificial Stone flagging for Sidewalks, etc
For further information, Circulars, Plans and Estimates, address JOHN J. SCHILLINGER,
111 Broadway, N. Y.

Kewanee Automatic, Solid Wheel, **Wind Mill.** Warranted superior in Elegance, Durability and Power, to all other wind motors yet made. Perfectly self-protecting and simple in construction, all parts subject to strain are wrought iron, Journal boxes of Brass with brass oilcups, all parts interchangeable with others of same size. First Premiums wherever exhibited,—43 in all. "We find it just as effective and more economical than the Steam Pump which we discarded for your Wind Mill."
AMOS CLARK, JR., President N. J. State Agr. Soc'y.

WELL-AUGER. Ours is Guaranteed to be the best in the world. Catalogue free.
W. W. GILES, 149 Clark St., Chicago, Ill.

TEAS. AHEAD ALL THE TIME. The very best fresh goods direct from the *importers* at *half* the usual cost. Best plan to Club Agents and large buyers. All express charges paid. Quality guaranteed. New terms free
THE GREAT AMERICAN TEA CO.

Biographical.

OUR PORTRAITS CONTINUED.

CHARLES DOWNING.

BY SAMUEL B. PARSONS.

There are few men who, at the end of a long life, can look back and see the result of their labors, can feel that the world is better for the graces and pleasures which they may have given it. It often happens that the value of such a course is not visible to others until it has passed away and the mystery of death gives a true estimate of life. Especially is it the case where natural modesty prevents the push with which some men thrust themselves before the world and achieve an ephemeral greatness. Ephemeral such greatness always is, for in the long run truth tells and character makes its true impression on the world.

There are, however, some men whose characters make at once this impression and the years, as they pass, only strengthen it. Of that class is the subject of this sketch, whose face we have before us.

Born in 1802, and working with his father among trees and flowers until twenty years of age, he then succeeded him and commenced that series of experiments with fruits, which makes him now the most trustworthy pomologist in America. From 1836 to 1838 he was in partnership with his brother who afterward commenced his literary work and filled the niche which was then open. A. J. Downing held a spirited and graphic pen and his breezy articles, when editor of the Horticulturist, were the natural outgrowth of his taste and love for horticulture. In the preparation of his book of fruits, however, he was much indebted to his brother Charles, whose long experience gave him accurate knowledge, and who had fruited and compared many thousand varieties. After the death of A. J. Downing this book passed through several editions, each greatly enlarged by Chas. Downing until the present edition is the best Pomological book in the world and made so mainly by the labors of the subject of this sketch. It was not until after 1840 that I knew either of them, and while admiring the striking qualities of his brother, I was always impressed with the quiet observation, the great accuracy, and the unobtrusive modesty of Charles Downing. He never sought appreciation, but always received it from those who truly knew him. While writing of his attention to fruits, I should not forget his love for ornamental plants and his knowledge of them. His old place was much changed in 1868 by the running of streets and the destruction of many of his trees. He still indulges his taste, however, and his memory does not fail him. Any one desiring information on fruits can rely upon its correctness, if received from Charles Downing. When thinking of the usefulness of such a life, one cannot help wishing for the old days of Methuselah when man's life was not limited to fourscore years.

In the career of the two brothers is a valuable lesson. One gave his life to save life—the other has spent his years in labor for men. Sacrifice and labor are two pivots on which the moral world revolves. Happy is the man who has his share of each.

Pomological.

THE INFLUENCE OF THE STOCK UPON THE GRAFT.

S. B. PECK.

At the June meeting of the State Pomological Society of Michigan at Muskegon, an essay with the above title was read by H. S. Tyler, of Dalton, Michigan, which comes more directly to the point than anything I have before read or heard. I will premise by saying of Mr. T. to those who do not know him, that he is one of our best posted men in the sciences of pomology and horticulture. Old enough to have made many experiments and to have noted their results, he needs here no backer to his word or his note. He claims to have noticed as early as 1849 great differences in the flavor, size and color of several of the popular varieties of apples grown upon different trees. This led him to notice carefully the departure from the normal type of those top-grafted upon trees that had already borne fruit the character of which he had known, and he found, in most or all cases, that, though the fruit of the graft did not lose its identity, still there was more or less departure from the true type either in the form, flavor, size, color, contour or keeping qualities.

He also placed on exhibition at the above meeting Baldwin apples from three different trees, one of the common shape and flesh, one grafted by himself from a perfect Baldwin upon a seedling that had borne a smallish, sour, high-colored apple, with often a red tinge through its flesh; oblate in form and keeping very late. The apples from this graft, though still Baldwins, as reluctantly decided by the best experts after cutting and tasting, partook largely of the form and habits of the natural fruit of the tree, and as late as the 24th of July, instant, I saw them at his house in good keeping condition, showing the inside tinge and the other peculiarities of the natural fruit.

The third specimen exhibited was from cions from the same tree as the last, set upon a tree that had borne sweet apples, and though the departure from the parent stock was less marked than in the case of the other, still it was sufficient to create strong doubts of its origin. These three trees were all growing near together on the same soil and under the same culture.

CHARLES DOWNING.—FROM A LATE PHOTOGRAPH.

The exhibition of these apples reminded me of several peculiarities that I had formerly noticed in the products of different apple trees of the same variety. In two cases of five trees each of the same variety, bought and planted at the same time and showing no marked difference in appearance, one of each kind bore fruit three or four years before the others. In another case a tree of Talman Sweet bore apples regularly every alternate year, but of inferior size with generally a blush upon one side, but unmistakably a Talman Sweet, and what was still further remarkable of this tree, though not bearing on this question, the tree was forked in two main branches of equal size, one bearing one year and the other the next. I know nothing of the history of the tree except that, during the ten years that I owned and watched it, it never bore an apple on either branch except on these alternate years, and then never failed. Pedigree in grains has already become a prominent and interesting subject, and there is no question in my mind but that pedigree in fruits is of equal importance and practicability. It is to me quite evident that in the general method of raising fruit trees, especially the apple, there is a fault that is having a deteriorating influence in their fruitfulness and in the changing of the quality of their fruit.

This is not a new subject to me, but is simply freshly brought to mind by the exhibition mentioned, and if this is thought worthy of insertion in the RURAL, I may have more to say in the matter.—[Please do so—Eds.]

Mr. Tyler closes his essay as follows: "I will sum up my conclusions by premising that for success in attaining and holding a desired point of excellence in the growth of fruit, the stock must be known to be healthy, hardy and productive, and of a kind, either sweet or sour, adapted to the maintenance and perpetuity of those qualities of the kind which is sought to be maintained. Hence, my position develops the fact that promiscuous root or top-grafting—unaided by design to continue all of the good qualities of the kind, but operated for the purpose of rapidly multiplying trees for the markets—will always prove disastrous to the best interests of the orchardist, and carry with it more or less disappointment, loss of time and money, instead of profit and pleasure."

Muskegon Co., Mich.

ABOUT WINTER APPLES.

T. T. LYON.

This simple title has come to be recognized as including any and all apples that retain their qualities long enough to warrant the grower in gathering and placing them in the cellar or fruit house, although some of them may be in use in late autumn; and again, others may be found, even at the close of winter, yet too austere or immature for either dessert or culinary uses.

The line is so closely drawn and the variation is so great with change of climate or latitude, or both, that even Maiden's Blush, a summer apple in parts of Ohio, Southern Michigan and similar latitudes, goes into the cellars of Northern Michigan in November, coming out, in April or May, in fine condition; while Fall Pippin, Fameuse, Shiawassee Beauty, Melon, Rambo and others, properly speaking late autumn apples in the latitude of Southern Michigan, yet supply much of the staple for home use till the winter is considerably advanced.

It is, however, among the long keepers, properly so called, or what might appropriately be designated as spring apples, that we shall find the most valuable varieties, whether estimated from the standpoint of the producer, or from that of the consumer. Among these we shall find Rhode Island Greening, which goes from Northern Michigan to the Chicago markets in June as firm as if just taken from the trees; also the Baldwin, Golden Russet, Roxbury Russet and Red Canada, which last remains in the markets and upon the fruit-stands of Chicago and Detroit till actually crowded aside by shipments of the next season's crop from the South.

The opening to us of a European market, by means of steam transit across the ocean, must, in the nature of the case, tend strongly to increase the value of this class of apples, from which must doubtless come the bulk of the supply of this newly-created demand: while Western growers may confidently anticipate that a few years only will, with the constantly increasing demand for such facilities, open to them the advantages of direct shipment from our lake ports to the seaboard markets of Europe.

It is by no means a surprising fact that southern varieties should, in our more northern climate, lose something of their quality. This might naturally have been anticipated, and such proves to be the fact, but there is yet another fact, which we have pretty effectually demonstrated by the testing here of nearly or quite one hundred of these Southern sorts, that while many varieties of Eastern origin prove more or less tender in the climate of Michigan, as well as in their Eastern homes, not a single variety originating south of the Ohio river has proved otherwise than entirely hardy in the Peninsular State. This, to us, is a surprising paradox—one the reason of which we are utterly unable to conceive, and we speak of it here with the hope that among the savants and apostles of Pomology some one may be able to offer us a rational explanation.

MICHIGAN STATE POMOLOGICAL SOCIETY.

This Pomological Society calls attention to the following facts about the fair of 1879:

1st.—Our hall is to be greatly enlarged.

2d.—The arrangement of fruit and flowers will enable an observer to take in the entire exhibit at a single glance.

3d.—Our plates are pearl-white and thus add to the appearance of the fruit.

4th.—We have, at much expense, secured brass clasps to be attached to the plates, which will hold card labels well above the fruit.

5th.—Our cards will have names of all prominent fruits printed thereon in clear, bold type.

Do not neglect us this season. Apples are scarce but other fruits plenty. Our premium list, which has been sent you, offers better inducements than last year. It will expedite matters and prevent a great rush at the opening of the fair if all those who are to make a number of entries in the department of *Fruit and Flowers*, will make out a list of the entries before fair-week. All that desire blank entry lists, please drop me a card giving full name and address; I will forward them at once. If lists of entries are made out before September

1st, send to me at Grand Rapids; later, in care of Sec'y R. F. Johnstone, Detroit.

Go through your orchards, gardens and green-houses, and select your best for the fair. Our Society has never failed to make a grand show. *Let us maintain our reputation.*

CHAS. W. GARFIELD, Sec'y.

Grand Rapids, Mich.

DOYENNE D'ETE AND MADELEINE PEARS.

Twenty years ago I set out an experimental pear orchard of about 50 trees. Among them were three of Doyenné d'Eté and two of Madeleine. Of the former, two soon came into bearing; the other took to growing, and now girths 28 inches to the others' 20, and for a number of years past, bore as much fruit as the other two, one of which was killed by blight last year. They are good annual bearers; fruit small, sweet and delicious, and as handsome as good. Every year, about the 20th of July, if the weary system and a waning appetite craves something a little out of the ordinary bill of fare afforded by the berry season, I am sure to find it on application to these Doyenné d'Eté trees. As far as my knowledge extends, this is the best and earliest pear I know of, and, unlike most pears, it is not improved by house-ripening, attaining a higher degree of perfection if ripened on the tree.

The Madeleine comes in a few days later, is not so attractive in appearance and is more perishable, rotting at the core while externally appearing sound. It is more juicy and slightly acid. Sometimes it rots badly on the tree before maturing. Yet, perishable as it is, with all its faults I don't regret having a tree of it. This orchard has been a good school in which I have learned a good deal of the little pomological knowledge I possess, and I hope and trust to take many more lessons from the same source.

DOYENNE D'ETE.—(FROM A SPECIMEN SENT BY MR. WILLIAMS.)

Arboricultural.

FUEL FOR THE PRAIRIES OF THE WEST.

JUDGE WALTON.

A TERRITORY larger than New York and Pennsylvania, including part of Missouri, Kansas, Colorado, Indian Territory and Northwestern Texas, is practically treeless, as far as fuel for the future owners of the many fertile quarter-sections is concerned. With some 10 years' close observation over much of the territory, I make a few suggestions to those contemplating settling on the plains.

First, for fuel, each occupier of a "claim" (quarter-section) should plant, say, half a bushel of peach seeds as soon as possible. They should have lain out of doors or been buried the previous winter, or they will be a year coming up. Plow, in last year's breaking, furrows eight feet apart, then drop seeds every four feet and turn under, and plant corn in alternate rows. Carefully cultivate two or three years, and then they will care for themselves. But if the seedlings are put eight feet each way, and budded with very choice varieties very low down, so that the bud may take root below the ridge made by plowing, a big pay will be secured for a few minutes' work, as a fine Crawford Early or Hill Home Chief (?) is much better for the pigs, or children—and a Kansan should keep both on hand—than the little sour seedlings that cost nothing and are dear at that. Any man intelligent enough to be a pioneer, can learn to bud in ten minutes, and by practice can bud 200 to 500 a day during June, July or August.

In the first five acres one should plant, 32 feet each way, in place of peach trees, his future apple and pear or cherry orchard. The peach trees protect against wind and sun till the others get a start. Don't trim a peach tree or transplant one. At the end of five years, cut them at the ground in February and cover the stumps with earth. You have in each tree a day's fire for a stove in the coldest weather, and by fall you will have a fine growth that in three years will duplicate the first timber crop, when they should be grubbed out of the apple orchard, which will then be able to take care of itself. The fuel grove can be cut every three years, or, by cutting one-third each winter, it will last an unknown period. Dry peach wood is as good as corn for fuel, and the fruit is very good for pigs and children.

For the first two or three years the borers will be troublesome in the apple trees. Travelling tree pedlars will sell you a recipe for $5 that will give good satisfaction, and kill both the insect and the tree, likely. A wash made of wood-ashes and water, put on in June, July and August, each month, will kill the larvæ and help the tree. The same wash applied to your peach trees will save you trouble.

For permanent timber, the Bois d'Arc, or common Osage Orange hedge plant, is the best timber for all purposes south of 40°. A ten or fifteen-acre lot set 10 feet each way with Orange, Pecan, Black Walnut, Ash and Maple, surrounded by a belt, 50 feet wide, of Cottonwoods five feet apart, will in a few years be very convenient and valuable. The Catalpa and Coffee Bean are of quick growth and afford valuable timber, but sprout wherever a root is cut so badly that they are objectionable. All nut-bearing trees, as the Pecan, Walnut, Oak, Hickory or Chestnut, should be planted where they are to grow, as the cutting of the tap-root ruins the tree. Timber culture means just what corn culture means—judicious work and plenty of it. Peach trees are the cheapest and best for fuel, but many raise Cottonwoods because they have no misgivings about cutting them down, as they have with regard to a fine fruiting Peach. Apple trees need the protection of a grove until four or five years old, when they will take care of themselves and bear very superior fruit. The Bois d'Arc—Osage Orange—grows rapidly, works like oak timber and will last like Black Locust. Pecan, Walnut, Oak and Chestnut grow slowly at first; but when about five years old, grow as fast as any tree. Maple does well, but is not valuable for timber. Lombardy Poplar grows very fast and is about as good as Cottonwood for fuel.

SHELTERING LANDS.

THE advantage of sheltering lands and buildings by trees has long been admitted by the more observing, and many are now selecting groves as their building spots, in order to avail themselves of the protection these give from the high winds of winter, as well as from the fiercer glare of the summer sun. While many are doing this, there are not a few others who are pitching their homes on the hill-tops, far removed from shades and screens, regardless alike of the furious blast and their own comfort as well as that of their animals. True, such situations are well adapted for the display of white paint, a color very common in the country; but what ideas of comfort or home can be associated with such citadels upon the hills, I never could imagine. During last winter the severity of the weather was a subject of remark by everybody. Its winds were frequent and unusually severe. Their influence upon man and beast was felt in a manner that might well lead one to exclaim, "Is there not a remedy?" Now I venture the assertion that, in localities protected by trees, not only was there much less wind than in exposed places, but that there was an average difference of several degrees of temperature in favor of the protected localities.

The labor of planting out a sufficient number of trees to break the wind from a garden and buildings connected, is comparatively trifling. A trench may be dug in which the plow may be made to perform much labor, and the trees (evergreens) can be removed in a short time, for they may be found in old pastures or swamps, or at the nursery, where they can be obtained at a trifling expense. When once transplanted, they need no further care than protection from animals that would otherwise be almost certain in the early period of their growth to destroy them, especially the under branches, which should remain entire. I can imagine that many might urge as an objection that these protecting belts would occupy too much land. Fortunately, ours is a country of sufficient extent to give to every reasonable man all the land he wishes for every purpose of improvement. If it were not so, the land is not lost on which trees are growing, but is increasing in value at a high rate. But allowing it is lost, what then, if the adjoining grounds are made to produce more by the loss than they did before the narrow strip was occupied by the belt? The increase of comfort in winter is also to be added to the increased productiveness of land. Is it not a wonder that farmers are not more engaged in protecting their dwellings and gardens in this cheap and simple way?

Farm Topics.

OUR FIRST MOWING MACHINE.

H. HENDRICKS.

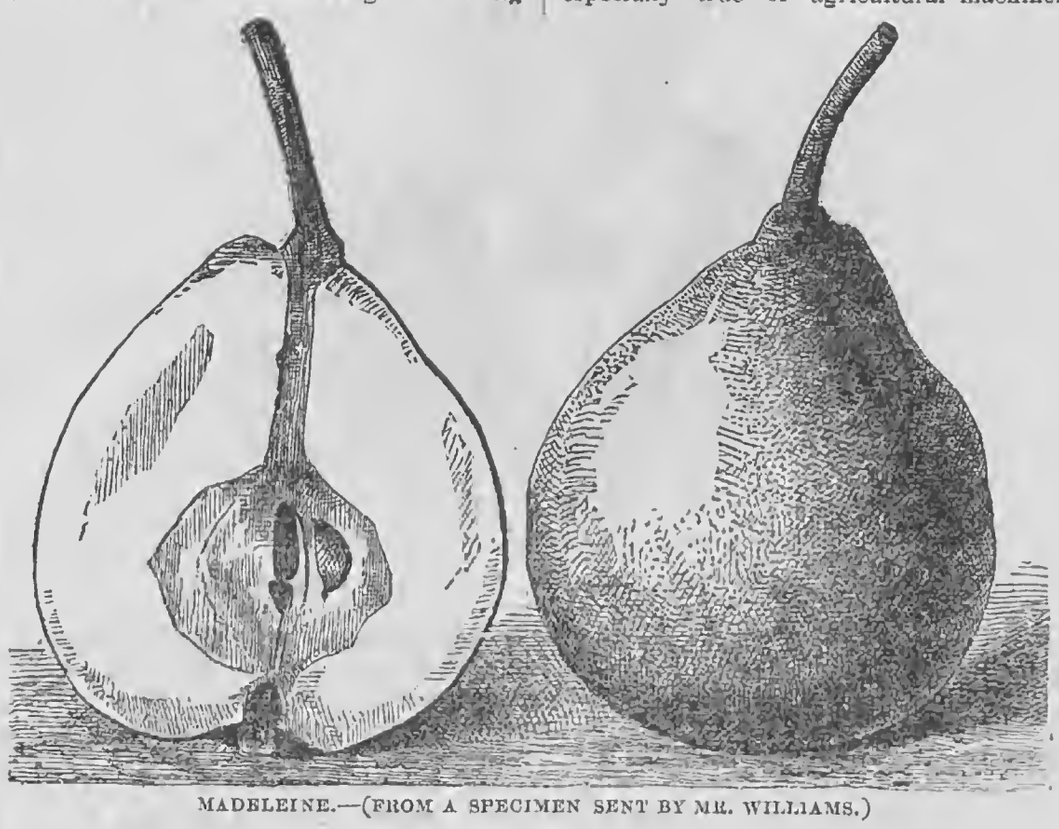
THE rapid progress of human invention in some of the branches of mechanical art as applied to labor-saving implements, is not fully realized in this progressive age. And this is especially true of agricultural machinery, and the ordinary utensils and mechanical adjuncts found on every well ordered and successful farm in this country. Why, just stop and think a moment. Let your mind run back over the checkered vista of your agricultural experience, and see how this and that were done twenty, thirty or forty years ago; how long it took and how imperfectly at best all these things were accomplished when compared with the methods now employed. Such a thing as a thousand-acre wheat field or one of a hundred either, was then unknown and impossible. And perhaps in few other departments of farm labor have the improvements in machinery and the saving of labor been so great as in the operation of harvesting the crops. And this brings vividly to my mind

The Debut of the Mower and Reaper.

It was on my mother's farm on this bank of the Hudson River, and not far from this city, that the ton of mechanical impossibilities then known as the "Wood & Manny Mowing and Reaping Machine Combined" first made its appearance in this section of country. A little over twenty years ago, as near as I can now fix the date, the general agent of the patentees—I wish I could remember his name as well as I do his stub-toe boots then first in fashion—pounced down on my overcredulous grandfather, who was in charge of the farm during my minority and sold him one of these machines, and to this day I have been entirely unable to understand why it was that we were thus selected to conduct those heartrending and patience-corroding experiments with that primitive bundle of complex meadow mechanism. Our reputation for family piety was good, and we were quite unconscious of the amount of personal guilt which this penalty seemed to disclose. But the two wagon loads of boxes containing this wonderful machine duly arrived a few days previous to the commencement of harvest. We unloaded it in the barn, and it took four days to get all the parts together, and then several pieces were left out in the hope that their places would be indicated on actual trial, which expectation was fully realized afterward.

We had a handsome, fiery team of sorrels I remember, which were constitutionally opposed to a racket of any kind, and especially to any noise at their heels, to which they might be contributory. This was a new dilemma for which the explicit directions sent with the machine contained no remedy, and this single oversight gave us no end of trouble. But we persevered, and finally, one morning early before the neighbors were astir, we drove out into a partially concealed meadow with the ponderous apparatus, hoping to get it nicely under way ere anyone might arrive to witness operations. Proudly through the pasture lot we went with the gayly-painted monster, and off streaked the frightened cows with heads and tails erect. The rattling of the gearing, the couplings and the connections, resounded through the adjacent woodland. A plot of grass had previously been prepared for the advent of the machine by hand-mowing a strip around the outer edge; the thing was copiously oiled and all the nuts turned up; the belts were adjusted and off she went—for about a foot. It was not fully in gear. We tinkered a little, sent her off again, and proceeded about a rod, when the belt got off the reel-pulley. We tightened her up, started once more, went along slowly a few rods combing out a majority of the terrified grasses, when the huge driving wheel began to sink in the soil, and the motion of the knives was impeded and finally stopped altogether. In this unfavorable condition it remained for sometime, in spite of our best efforts to infuse activity. The neighbors, having been attracted by the noise, now began to arrive from all sides; and never at a more unwelcome moment, for from the first arrival of the machine, we had been thronged with visitors all of whom predicted utter failure. Hence, whatever our own private opinions might be, we were resolved, if possible, to disappoint these discouraging old fogies who *wouldn't have the machine for a gift*, they said; so in response to their encouraging, "I told you so's" we fought around the field with the monster once or twice during the morning, in a most unenviable state of mind, and finally returned to the barn with such parts of the mower as we had not lost and a few things broken, bent, and disarranged generally, our horses in a foam, and ourselves somewhat disheartened. But the trial, conspicuously unsuccessful as it was, while it greatly weakened our faith in labor-saving implements on the farm, had also given us much valuable information. We now took a day for study and research; during which time an uncle, who was fortunately the possessor of a blacksmith's shop, and a good thoughtful mechanic, repaired the broken parts. The agent came with his kit of tools and duplicate parts, and told us how we had got the thing wrongly together. Everything newly adjusted once more and lubricated to saturation, off we went for the meadow with a retinue of hired men and attendants under the lead of the agent who would show us "how it was done," he said.

But the improvement still lurked in obscurity. The grass was yet wet with dew and lingered among the intricacies of the finger-bar, clogging the knives unmercifully every few feet; the reel had a spasmodic way of performing its duty; in fact the whole device was strangely afflicted with a most annoying



MADELEINE.—(FROM A SPECIMEN SENT BY MR. WILLIAMS.)

convulsive tendeney while in our service from which it never fully reeovered. Nuts would work loose and drop off, pitmans would twist and break, cogs would disengage and slip, journals would heat and hug the demoralized shafting, and the entire apparatus seemed diametrically opposed to being used as a mowing machine. But being resolved to overcome this notion, if possible, we followed the thing around the lot, the agent, ourselves, the hired men, and a deputation of spectators; some of us with repairing tools, others with grass scythes to complete the imperfect work. The agent was a plucky fellow, but found the contract too large and finally left for more explicit instructions from head-quarters, promising to send some men and improved parts.

In this way we mowed along with this ancestral queen of the meadows for some weeks, getting behind our neighbors, allowing our grass to deteriorate in quality and well-nigh losing the price of the machine in the extra wages paid to hired help. We also tried its adaptability for reaping grain, hooking on all the attachments; and a more formidable and hungry-looking appliance it would be difficult to imagine. But in its capacity as a reaper was the failure most brilliant and complete; and such an ignominious snarl of wood, metal, straw and grain as we very promptly sailed into on the start, never was seen. We very soon became satisfied with its complex advantages in this direction, and drew out of the field. By this time various little improvements having suggested themselves to our minds, and several parts having become either broken or lost, much of the machine was reconstructed and essentially new, and yet there was no visible sign of success; although I remember my own youthful mind was then fully impressed with the entire practicability of mowing and reaping by machinery. But we gave up the contest for the time and the wonderful machine was stowed away in the back corner of a granary where a few of the parts may yet be found. Not content with this experiment, however, we continued to test the various mowers that appeared after that, until, in 1860, we purchased the new Walter A. Wood Mower, which was the first really successful machine we could find; and I may add that this very machine with parts supplied as they became worn, has been in use on that farm yearly ever since, doing its work well, and is to-day in active service. And for some reasons I yet prefer it to many others of later design. Surely the improvements made in agricultural machinery alone during the last twenty years have been most remarkable.

Ulster Co., N. Y.

EDUCATION OF THE RURAL CLASSES.

PROFESSOR ELBRIDGE GALE.

I AM glad to see that the editorial columns of the RURAL NEW-YORKER have spoken out so clearly of late for the higher education of the farmer. The hope is cherished that the time is not far distant when the entire rural press will speak out specifically on this subject. The education of our youth towards the farm is a matter of vital moment. It is useless to regret the departure of our young men from the farm, while we fail to educate them for rural pursuits. If we wish to raise the estimate in which rural occupations are to be held by the people, we can only do it by securing a higher grade of intelligence on the part of those engaged therein. If those who are engaged in the various pursuits of the farm, are to exert a controlling power in society, it will be attained only through a wise and broad culture. This culture must not only be broad and thorough, but it must be peculiarly adapted to rural life. In its culture for life on the farm, we believe our educational system is defective, and on that ground it should be carefully scrutinized by those who are most interested in the matter. A certain class of journals indulge in a great deal of cheap talk over the beauties of our educational system, but when we see its effects upon our youth, it is our privilege to look into the mode of culture for farm life and see if there is not something more that can be done.

All the culture offered the rural classes with special reference to their occupation, can be placed under the following heads:

1. The rural press, embracing all that class of papers in part, or entirely, devoted to the varied pursuits of the farm, the orchard and garden. The press is doing a grand work in the popular education of the people. It must be accepted to-day as really the great educating power, exerting, no doubt, many-fold more influence than all things else combined. The importance of the press can scarcely be realized. Its wise direction must always be a matter of the gravest moment. The farmer, in his quiet home, should always be proud of what the rural press has done for him, and cherish it as the one great instrumentality for his deliverance from the bondage of ignorance and wrong.

2. The second educating power embraces all associations or societies formed either to promote all the interests of the farm and farm life, or some special rural occupation. These, no doubt, have done a great deal of good; but they at most can be said to exert only a secondary educational influence, their object being more to stimulate enterprise than to prepare minds and hands for industrial work.

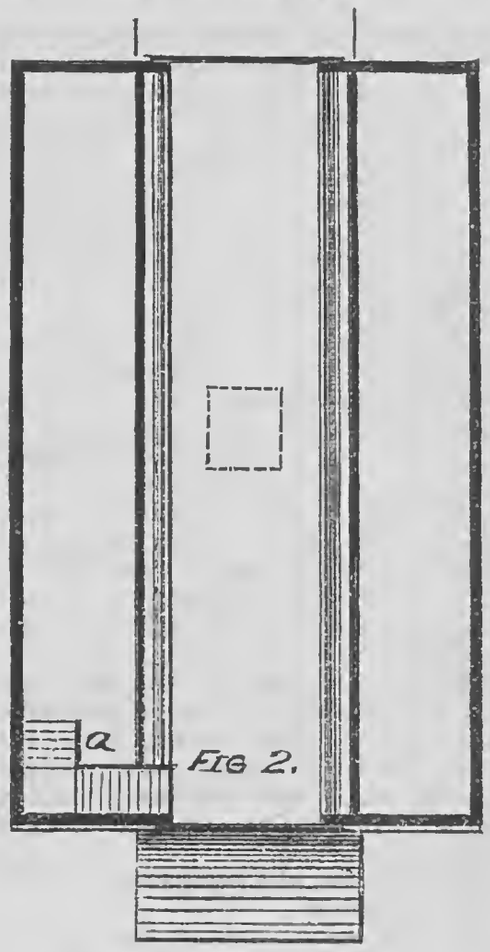


FIG 2.

3. As the third and last educational power, we have the Agricultural Colleges. The original aim of these institutions was, no doubt, in the right direction; and where this is carried out they will be a success. Some of these institutions are no doubt exerting a very salutary influence, as far as it goes, in the education of the rural classes. Others of them, as far as can be inferred from a careful scrutiny of annual reports, are little more than agricultural in name, really making agriculture a kind of fifth wheel, giving her a place by sufferance because the uncomely maid brings a fair endowment. Even in some of these cases, you may see sometimes a very fine display of agricultural pyrotechnics, but no harm will be done perhaps, if we remember that whatever goes up like a rocket must come down like it also. These institutions do not even remotely reach one in a thousand of our youth. And very small is the number of those who come under their influences who are thereby led to rural pursuits. So we are reluctantly forced to accept the fact that the great mass of our youth are receiving no special training for rural life. The instrumentalities are all good so far as they go, but they are not sufficient for the emergency. We must seek in some way to give the elements of rural culture to the children, and as soon as this can be done, the power of the press, societies and agricultural colleges for good, will be immensely increased.

Manhattan, Kansas.

CHIPS.

IN timber countries there is always a woodpile, a wood-shed and a chip-yard at every house. The soil is mostly heavy clay, hard to plow, easily dried up, soon baked after a rain, and generally not conducive to root growth. Many modes are employed to render such soils sufficiently open, warm and moist for the rapid growth of esculent roots, especially potatoes. Heating manures (long, strawy stuff) are not good for such crops, and all manures are scarce; but chips for a potato patch are far beyond all other natural manures for this root. They keep the soil open mechanically; they keep it moist by the attraction between decaying wood and the atmosphere; they keep it warm, both while undergoing fermentation and decay, and also, by fostering looseness, they admit the air and its genial influences, which are many.

Most farmers know all this, and put their knowledge into practice. Many know it, and do not do so. I wish to say to these latter that by allowing small chips to accumulate around the house, they maintain an unsightly appearance, and by not hauling them to the potato patch, they lose annually 50 per cent. of the crop in quantity and as much in the quality. This little problem in percentages does not mean that the whole crop is lost, although 50 plus 50 do equal 100. Still the *gain* by the use of chips for this purpose is 100 per cent., taking it "by and large," as the sailors say. This kind of manure is immediate and lasting in its beneficial effects, is cheap, handy, and a dead loss unless put to work, as all waste material should be.

Farm Economy.

AN EXCELLENT CORN CRIB.

PROFESSOR C. L. INGERSOLL.

THE accompanying cuts illustrate a corn crib which was built here, at the Agricultural College last year. After one year's experience we are so well satisfied with its construction and its advantages that I feel justified in presenting a brief description of it for the benefit of the RURAL readers. The building, which is seen in Fig. 1, is spacious and substantial, measuring 40 feet in length by 24 feet in width. Special regard has been given in its construction to the free circulation of air through the cribs, this being an essential point where a large quantity of corn is stored. It rests on a stone foundation 18 inches high, which, however, does not run the entire length of the house but only six feet from each corner and six feet in the middle. A driveway, 12 feet wide, passes through the middle with the cribs on both sides. The approaches are plank bridges, and the sliding doors, at both ends, move on rollers. The lower story is 12 feet high,

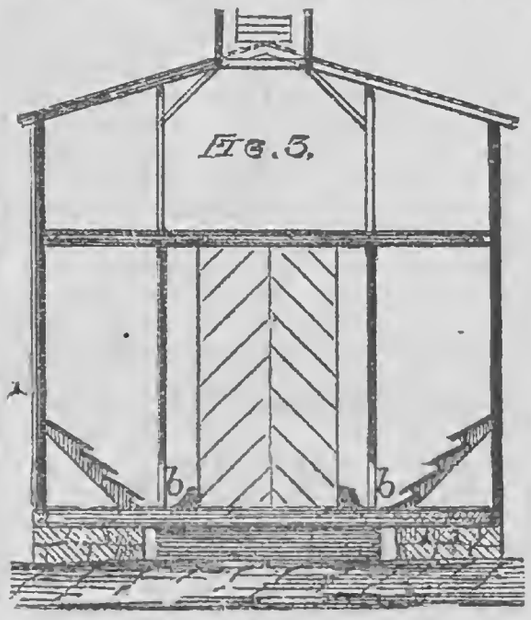

FIG. 3.

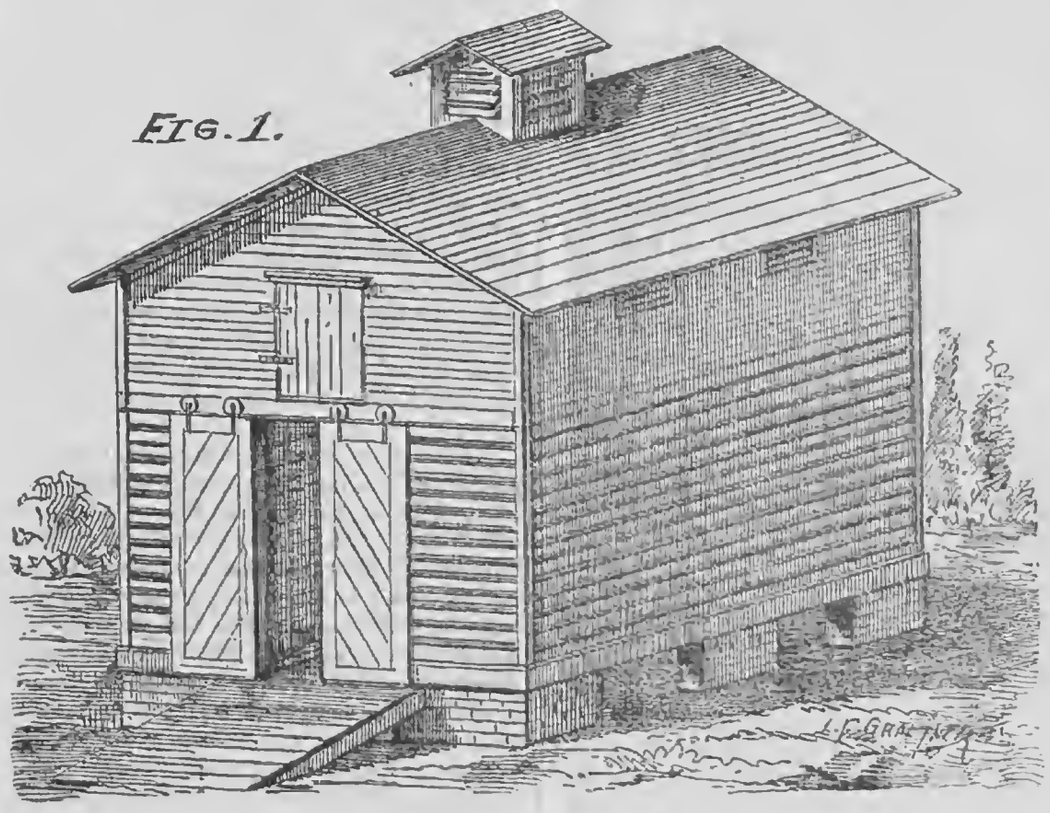

FIG. 1.

the house is sided tight and the ventilator acts as a chimney, inducing currents of air through the cribs, as the center of the loft is floored over.

The ground plan is seen at fig. 2, with the stairs leading to the loft at a. Fig. 3 shows a

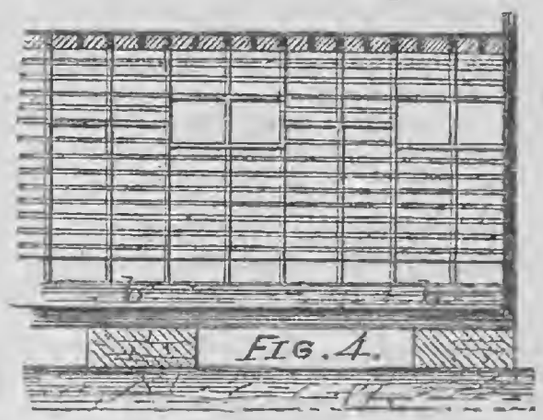

FIG. 4.

section of the house. Instead of letting the corn rest directly on the floor, scantlings sloping forward at an angle of about 40 degrees, are spiked to the studs of the siding, and to these planks are nailed, as shown in the cut, upon which the corn rests. There is a space of one inch from plank to plank, but as they are inclined forward and overlap one another a couple of inches, no corn can run out. This construction gives free access of the air, and the corn is constantly moved forward to the place where it is shoveled out. A space of 16 inches is left open at the base of the cribs through the whole length of the house. Through this opening the corn is removed from the cribs, and to prevent it from sliding out in the driveway, a two by six-inch scantling, b, b, is bolted to the floor 18 inches from the front of the cribs.

Fig. 4 shows a front view of the cribs. The boards are planed strips six inches wide and nailed so as to leave inch openings between them. At convenient intervals are openings, through which the corn is thrown into the crib from the wagon.

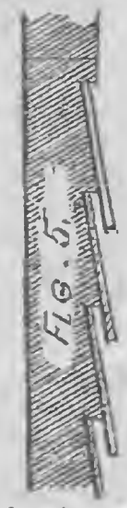

FIG. 5.

The advantages offered by this construction are: 1, A wagon can be driven through the house from either way and be loaded or unloaded from any part of the crib. 2. Its arrangement is such that air can pass freely through the house from any direction, and still no corn can run out, not even shelled corn. 3. If the corn should be put in green and there is danger of molding and heating, or if rats and mice should begin to work in it, an hour's work with the shovel, throwing the corn from the bottom to the upper portion of the crib, would change its position, prevent it from heating and destroy the nests of the vermin. In an ordinary crib this would be a laborious task, especially if it was full, as a portion of the corn would then have to be removed before the rest could be turned. 4. Every load taken from the crib causes the rest to be moved without extra work.

Some of these principles have been applied singly, but I have never before seen them so advantageously combined. The whole house can hold 5000 bushels, 4000 below and 1000 above.

Agricultural College, Lansing, Mich.

WHEN TO APPLY MANURE.

Like the writer of "History of a Poor Farm," I was a strong advocate of surface application of manure, but have lived to learn the truth of the old saying, "circumstances alter cases." On lands adapted to the growth of grass, there is probably no better way than to use fine manure—made so by frequent forking over—spread evenly on the sod, for I believe it to be a truism that, if we can get a rich sward, we shall find no difficulty in growing profitably any cultivated crop adapted to the soil and climate, until that fertility is exhausted. But let us take, for instance, the sandy lands of the South, where valuable grasses do not thrive and where experience teaches that but very slight benefit is derived from manure on the surface, while a wonderful effect is produced by plowing it under. In effect we attain the same results from fresh manure plowed under on sandy lands, that are accomplished by forking over or piling in a compost heap; therefore we get an earlier return than we would from the same process on a clay soil. Of course, however, the effects are not so lasting. Many farmers hold that the best results follow the application of manure to corn after the first hoeing; for if the manure is applied before the corn is planted, its strength is all gone before the ears are set, at which time stimulating food is most beneficial to the plant in order to produce the highest results.

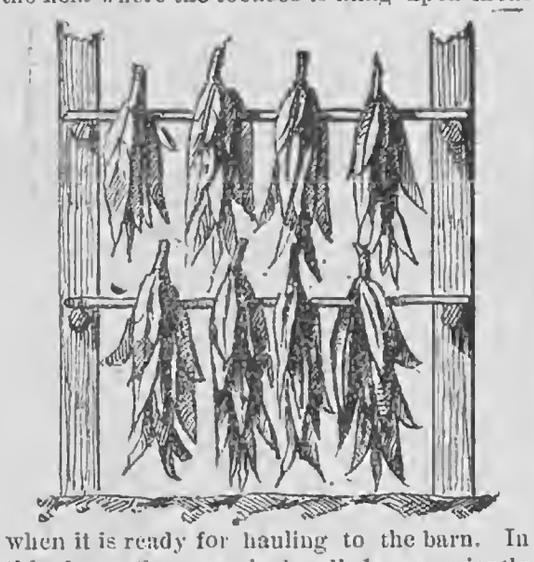
P.

A BETTER CORN MARKER.—The Corn Marker by I. P. Roberts, of Cornell University, is good only as far as it goes. It is exactly like those that have been used in this country for the last

eleven years, to my knowledge, and I presume for as much longer. I improved it in this manner: I made *two* trackers instead of one, and the *middle runner* three times as long as the side ones, and thus by equalizing the draft on the two sides, and adding a stiff rudder, obviated all difficulties in marking straight rows. I round the *front end* of the runner as he does, and also the *back ends*, to facilitate turning. Five runners, if the team is strong enough, will run as well as three, and get over the ground faster. S. RUFUS MASON.

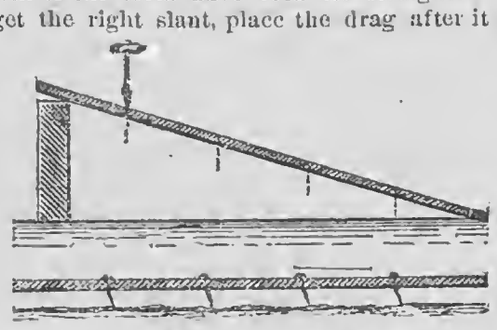
Dodge Co., Neb.

A GOOD METHOD OF CURING TOBACCO.—In the curing of tobacco it seems to me that our Southern manner of hanging it, is much better than the practice of New York State growers. Our barns are provided with cross-timbers, or rather poles placed in tiers a sufficient distance apart to allow of a free circulation of air between the courses of tobacco, and four feet asunder horizontally. Then a stock of sticks usually of pine, are split four feet long to an inch square, and we are prepared for cutting. With a large knife, split the plant down to within about six inches of the lower leaf, cut and leave it to wilt. The sticks are taken to the field where the tobacco is hung upon them



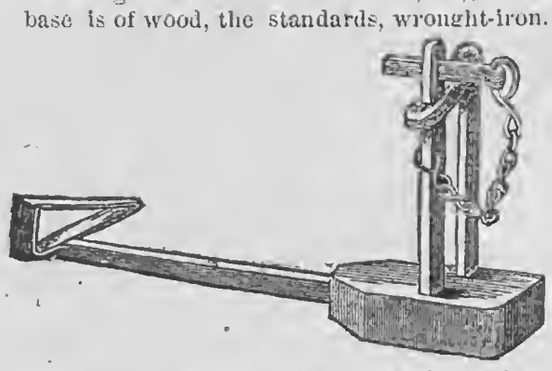
when it is ready for hauling to the barn. In this shape the crop is handled conveniently and more expeditiously than by the northern method. Another advantage gained is in the more rapid curing of the stalks. The sticks will last a life-time, besides being less expensive than twine. M. B. B.

HOW TO SLANT DRAG TEETH.—In making a drag, always set the teeth slanting; then it will not gather grass, weeds, roots, etc., as it will if the teeth have been set straight. To get the right slant, place the drag after it is



framed, or one of the beams before it is used in the frame, on your saw-horse; then put under the head end something so as to raise it, say 2½ inches, and bore perpendicularly downward, as here represented, and the proper slant will be secured.

AN ENGLISH PLOW SLED.—The accompanying engraving is a representation of an English plow sled, recently shown at the International Agricultural fair at Kilburn, Eng. The base is of wood, the standards, wrought-iron.



The plow is securely placed on the sled between the uprights, the latch thrown over and secured by the pin, when it can be dragged conveniently to any part of a field from the barn. The device is so simple that any farmer could construct one, using wood entirely.

THE illustrations of root cutters in a late number prompt me to send the RURAL a note of my "wrinkle:" Having a good broad-axe, which was not very frequently used for its legitimate purpose, I had the blacksmith bend a handle for it of ⅝ round iron, something like this.

The crook at the lower end of the handle is slipped into the eye of the axe, wedged to its place with a good hard-wood wedge. I have the best hand-cutter for roots I ever saw. It holds an edge splendidly, its great weight makes it slide through the hardest ruta-baga like a hot knife through butter. J. A. W.

Howard, Pa.

Miscellaneous.

HISTORY OF A POOR FARM.—No. 14.

The Season's Work.

ON the whole the progress during the present season, so far, has been satisfactory. The constant necessity for expenditure in permanent improvements, such as additions to the fences and buildings and the purchase of artificial fertilizers, has used up all surplus income, but it is something to be able to point to a monthly cash account and see that the balance, if it is but a small one, is always on the right side, and that the stock is increasing and the condition of the farm is improving, in addition. The work done this season has been as follows: Field No. 2, consisting of 12 acres, has been planted with four acres of early sweet corn for market; of which the first gathering, much injured by dry weather, has already been made; three acres of Globe mangels and sugar beets; three acres of late sweet corn and two acres of German Millet. The early corn being now in course of harvesting for market, the stalks will be cut at once for the cows and the ground will be plowed and sown to rye for early cutting in the spring. Field No. 3, five acres, has been sown to oats, which were cut and fed, and the ground is now in Hungarian grass, which will soon be ready for cutting, when the field will be at once plowed and seeded with white turnips, with orchard-grass and clover, for cutting in the spring. Field No. 4, six acres, has given a crop of rye, used partly green and partly cut ripe for grain and straw, the ground having been plowed and sown to millet; and three acres of oats sowed late and now cut, the ground being plowed and planted with melons for market. Field No. 5, four acres, is planted with corn fodder, as is field No. 6, of about four acres. The swamp field, 10 acres, is in grass, which has been mown for hay. The remainder of the 65 acres is as yet unimproved and remains partly in a piece of shaded pasture not yet quite cleared up, and some hill sides overgrown with brushes, which have not yet been cleared for want of time and means. The stock has been increased to 17 cows, one bull and six calves, which have been fed from the farm, some surplus has already been put away for winter feeding, and the ground is all still occupied with flourishing crops. One field, No. 1, of five acres, in clover and timothy, has been mown twice and the clover is now seeding and will be left to drop its seed upon the ground.

The cost of artificial fertilizers this season has been about $100. Two hundred and twenty-seven loads of manure have been used on field No. 2; 40 loads upon field No. 3, and 22 loads upon the melon patch in field No. 5. The effects of last year's application of fertilizers upon fields five and six have been so marked that, with the exception of 200 pounds of guano on the melons and 300 pounds of complete manure upon the oats,—very light dressings,—no other has been thought necessary. The clover in field No. 1, dressed with 1,000 pounds of complete manure in the spring, gave as good a yield as could have been expected, considering the dry weather; equal at least to two tons of hay per acre.

"You would have done much better if you had got your plowing done earlier," remarked William.

"If there is an early frost, the late corn will be caught, that is certain," responded my old neighbor.

"Well, what is the use of borrowing trouble?" said Mr. Martin: "when a man does his best, it is stupid to be always saying: 'If I could only have done so and so!' Farmers are the greatest grumblers in existence. The weather is always too dry or too wet; there are these bugs and those worms; and a peck of troubles always ready to be overhauled and counted over and over again. What is, is to be; and cannot be helped. If I were not a Christian and a believer in a good Providence, I would be a Mohammedan and a believer in fate; indeed, I don't know but that the latter is sometimes the more reasonable and the happier man. 'Farming don't pay;' 'there's no money in farming;' 'there's no price for anything.' These are the common complaints, and some men sit upon the fence for an hour at a time grumbling about their poverty and misery, and if $10,000 were offered them for their farms and stock not one of them would say, 'thank you, I'll take your offer;' but would scornfully reject it. What would our fathers and grandfathers think of that despised $10,000! We have been living too fast and have learned to look upon an income, or a fortune, that would have bewildered our fathers who cleared these fields from the woods, as altogether beneath our notice."

"It has been the fashion," I replied, "to consider that a farmer who had everything about him in a sort of show condition—no weeds in his fields; the largest crops; the most costly stock, and every labor-saving device that money could purchase—as a 'high farmer.' This term is now better understood. The farmer who makes the best from his opportunities, and who makes the most from the least expenditure, is the high farmer. A Kansas or a Minnesota farmer who produces 15 or 20 bushels of wheat per acre on his prairie land, and neglects the manure which lies about his barn, and burns his straw to get rid of it, is doing a better and more legitimate business and is really farming better than if he spent much money for labor and stock to turn his straw into manure and to spread the manure upon his already rich soil. He makes the best possible use of his means and circumstances, and that is all that can be expected or desired. It will not pay to spend $100 per acre in improving land that can only be worth $75 when it is brought into cultivation, nor will it always pay to hire extra labor of men and horses to get a crop into the ground a week or two earlier. Judicious expenditures only are to be recommended: a farmer who spends money without good security that he will have it returned with interest, squanders and wastes it. We must thoroughly understand our business, and then manage it with as much skill as we possess."

"But everybody has not skill, and some don't understand their business," remarked the old gentleman. "I begin to think, although I am 86 years old, and have been farming since I was 20, I don't know so much about it as some of the young folks; at least they try to make me believe that."

"That's the way with young folks," drily remarked Mr. Martin.

"Well, is it not true of nearly every business and profession?" said I. "Doctors used to bleed and physic their patients upon every opportunity, and the lancet or the blue pill was the first resource. Now the practice of medicine is wonderfully changed, and the medical student is taught more to prevent disease, or at least to mitigate it by attention to sanitary precautions and gentle treatment, than to cure it by 'heroic' measures. The changes in the practice of engineering, mining, working of metals, manufacturing of all kinds, and transportation by land and sea, have made all things new in regard to these industries, so that the old practitioner or artisan has to begin anew or retire from business to make place for younger men. In agriculture, too, everything is new; old practices have become obsolete because of the new discoveries in agricultural science and the new inventions in agricultural machinery. The modern workman could not live by working as his predecessor of 50 or even 25 years ago. The cost of producing articles of consumption has been decreased greatly, and farm produce is no exception. The standard of living, too, is higher than it was. When things change so radically as they have done of late years, it is to be expected that the young people will do the new work and the old people will give place to them, to a great extent. Youth is enterprising and hopeful; age is conservative and cautious; and it must be confessed, in this enterprising country youth has the advantage of age. I think you will confess that your grandson William manages your farm in an excellent manner; and you must remember that the soil is now very different from what it was when newly cleared, 60 years ago."

"William does very well," the old gentleman replied. "The farm keeps a large family now, and his expenses are much larger than mine ever were. I don't know but, on the whole, his children have more enjoyment; I know they have less work to do than mine had. My only fear is that it will not last, and the farm won't stand the strain."

"Never mind, grandfather; as long as the farm is not in debt, and we never spend a dollar until it is earned, there will be no danger. When we have not the money, we can easily reduce our expenses, and my girls will take a hand in the work as well as any; although they don't care to do it until they are called upon."

"William is right," I remarked, "and Mr. Martin, or his daughter, even, cannot reasonably object to his views. Money is not the chief object in life. A safe source of income, of course, is desirable, if not necessary to happiness. That is reasonably assured on a good farm that is clear of debt and well stocked. The most reckless man could scarcely starve under such circumstances. The more certain a man's living is, the less need for a surplus in hand for 'rainy days' and times of disaster. A farmer can afford to live closer to his income than any other man, while seed time and harvest fail not, always providing that he keeps out of debt and buys nothing or incurs no liability until the cash is in hand to meet it."

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

About Clawson and Other Wheats.

CLAWSON wheat is the leading variety grown in this section of the country. Hundreds of acres are now being harvested, and the yield is fine. Everybody says the flour made from this kind of wheat is not equal to others, but it stands the winters well, and they feel so sure of a good crop with it, that they sow it. Some millers make much better flour out of it than others, as it requires careful grinding to keep the bran from mixing too much with the flour, which makes it dark-colored, and causes the bread to get dry quickly. Michigan White does well on the farm of Mr. Frederick Curtis. He has raised it successfully for a number of years, and gets first-class flour from it. His soil is a gravelly loam. Clawson seems to be suited to any kind of soil, and yields better than rye. Fultz is a stranger to us, but from what we can learn of it, we shall try it this fall. If it has the growing qualities of the Clawson, and will make better flour, it is just what we want. We have seen fine crops of wheat this year grown on old meadows, which were mown last season, and as soon as the hay was taken off were thoroughly plowed, and a few weeks afterwards pulverized with a two-horse cultivator. With this implement a complete summer-fallowing can be obtained between the hay harvest and the time to sow wheat, with the hay as a gain. In the hot, dry weather of summer the sods rapidly decay, and by cultivating two or three times, the ground is admirably fitted for the autumn crop. This is an advance on the old system of fallowing, which is the result of improved implements. Run-out meadows can be turned to good account in this way, and by reseeding with timothy or orchard-grass, sown with the wheat, may be brought back to a meadow with the loss of only one year. Mr. Frederick Curtis has practiced sowing clover in the fall with his winter grain, and is much gratified with the results. He escapes the spring drought which is often so damaging to spring seeding, as the autumn seeding is firmly rooted when it comes. He puts his crop in the last of August, so as to obtain as rank a growth as possible before winter sets in. This growth serves to protect the clover, and when harvest time comes, it is good feed. A very little manure spread upon the surface, will help the wheat and almost always insure a "catch" of the grass seed in the autumn, and make the clover, if sown in the spring, a success also. Broadcast sowing is avoided, if possible, as the drilling is found to be the best. When winter grain is sowed broadcast, it should be covered with a cultivator, and the ridges left to gather the snow and make protection. The deep covering will aid very much towards securing the same result by preventing the grain from being so easily thrown out by the frost.

Salt, Sulphur and Charcoal for Pigs.

We have observed that when pigs are fed a great deal of hearty food, they are fond of salt and charcoal. Pigs are often affected with indigestion, and the salt and charcoal are good remedies. We cannot very well mix these things with their food in the right proportion, and, moreover, it would not be best to attempt to force a pig to eat them unless it wanted to, or else its appetite might be destroyed and harm come from the experiment; but by mixing the salt and charcoal together, and putting them in a box accessible to the pigs, they will eat no more than they require. There is no danger in putting either salt, charcoal or sulphur, where the pigs can get them, but to mix them in their food might injure them, especially if any one of them should possess a voracious appetite. Hogs will eat a considerable quantity of sulphur, and it is exceedingly healthful to them as a purifier of the blood, and to help them to get rid of the vermin which infest their bodies inside and out. We want the pigs we are going to eat to have plenty of sulphur, at least all they will take. Their flesh makes better food.

Puddling Plants.

The RURAL sensibly urges "puddling" the ground when green plants are transplanted. By "puddling" is simply meant putting water in the holes where the plants are set out and covering the wet ground, which is pressed around the roots, with the dry earth; this keeps the moisture at the roots, where it is wanted. When beets or turnips are transplanted we always wring or twist off the largest leaves, and this keeps the plant from wilting. We set hundreds of mangels the other day by "puddling" and twisting off the tops when the sun was shining fiercely hot, and not one died that we have noticed. These facts about transplanting have been printed many a time, and we would not repeat them, but for the circumstance that a neighbor who saw us working had never heard of them and did not think transplanting could be done, in hot or dry weather.

Too Many Eggs.

We threw away sixty-five turkey eggs which would not hatch—reason, too many eggs under the hens and turkeys. In many of these eggs were dead turkeys, showing that they were chilled. We were too greedy that time, and tried to have the sitting fowls do more than they could.

The Defiance Wheat.

This spring wheat, like all other kinds, rusted badly and will not do well.

Industrial Topics.

PATENT RIGHTS.

Now that the Lee patent farm gate is under discussion, it seems to be a good time to discuss patents in general. The swindles put upon the farmers as a class, are invited by them in every case, and until farmers become readers and become posted thoroughly upon matters essential to their own prosperity, they will continue, as now, the butt for all the swindling fraternity.

To argue that because farmers are so continually imposed upon, the Patent Laws must be repealed, and the Patent Office abolished, is simply ridiculous. The true remedy is against the swindlers, not against the inventors. If a farmer has neither discernment enough to know a patented article from one not patented, nor common sense enough to know that "he has no right to use a patent for his own use" against the wish of the patentee, nor honesty enough to keep his hands out of the latter's pocket, the remedy is to teach the farmer better, and not to attack the men who spend time and money inventing improvements for those who scarcely know a hawk from a hand-saw. In this country we have our annual troop of agents selling all sorts of new notions to farmers, some patented and some not patented, but in nearly all the cases these agents are pure swindlers. I notice that only such farmers are called upon as have lax ideas in regard to "meum et tuum," or who don't take the papers, and who, having no brains of their own, and but weak perceptions of morality, depend for ideas upon any one who can find them out.

The usual mode here is to make a sale of something to be delivered in the future, get an order, which turns out to be a note of hand, sell the note to a third party, and collect at once under threats of the law. Now, if a man is too indolent to use his brains to inform himself sufficiently upon his own business, so that he cannot be swindled, it must be a luxury to him, and he ought to be taxed. I propose, that instead of attacking the Patent Office, we legalize all sorts of swindles, and license the swindlers. If the farmers won't learn in the usual mode, let them learn by experience; but don't let us hear any more about knocking out the brains of the inventors, merely because farmers have none themselves, or won't cultivate and use what they have.

That's too much like the old fable of the fox which had lost his tail in a man trap, and advocated that all foxes should cut off their tails, so as to be in fashion. The world moves, the farmers must move with it or be left behind.

Finally, don't let me hear any one say "he has no time to read;" as long as he has time to stand open-mouthed listening to a patent swindler, that tale is not true. I won't just now refer to the time spent in rum shops or while kicking the heels against store counters—but as there is a time for everything, there *must* be a time to read. S. RUFUS MASON.

EUROPEAN CORRESPONDENCE.

THE AGRICULTURAL SITUATION IN ENGLAND.

LETTER FROM PROF. G. E. MORROW.

LONDON, ENG., July 22, 1879.

The Agricultural situation in England is peculiarly gloomy. To all the causes for apprehension which have been existing and increasing for some years, is now added the bad effects of a season almost unprecedentedly unfavorable for farm operations. Cold and wet have been the characteristics of both spring and summer. In many parts of the country the season is fully four weeks later than usual. The almost daily rains have made it impossible, in very many cases, to properly cultivate the hoed crops, and have made the growth of the grains unsatisfactory. Complaints come of the inferior quality of the cattle received at the markets here. The absolute loss to the hay crop has already been very great. In the West of England, on Friday last, I saw hay being put in cock, which had been cut more than four weeks before. It is simply wonderful to me that this hay was still worth the saving. Much grass is still uncut and hence has suffered less.

It would be remarkable if the farmers of the country were cheerful and hopeful with such gloomy weather as still continues, even had they no other causes for discontent. But the unfavorable weather is but the last of a series of untoward conditions. For six years past English farmers have had peculiarly hard times. Of these six years, four have given bad wheat harvests, and the diminished yields have been accompanied by low prices. In an interesting article in the *Times*, contributed by "A Statist," it is stated that the wheat product of Great Britain for the last six years has been 13 per cent. less than that of the preceding six years, and the gross sum realized for it, 42 per cent. less. The average price per bushel in 1878 was less than a penny over 5s., the lowest since 1864, and lowest, save that year, since 1851. The returns for the barley and oats crops have also been below the average. This article also notes the striking fact that while there has been a reduction of 500,000 acres in these six years in the area devoted to grains, there has also been a reduction of 521,000 cattle and 2,266,000 sheep. During most of these years meat and dairy products have been of fair price, but now all these are lower, and the foreign importations are steadily increasing. It is also estimated there has been an average advance of two shillings on the weekly wages of the 1,000,000 agricultural laborers over 20 years old in Great Britain. As a conclusion the writer in question figures a total reduction of £97,000,000 in the gross agricultural returns for the last six years compared with those for the six preceding ones.

The distress is real. Very many tenant-farmers have already been compelled to give up their farms and the losses of many more have seriously crippled them. Landlords in many cases have remitted rents or made reductions in the rent rate for some years to come. Articles on the general subject appear almost daily in the leading papers. Public meetings have been held in which the causes and remedies have been discussed. The Government has granted a "Royal Commission of Inquiry."

It so happened that the first public meeting I attended in England was one of the "Farmers' Alliance," a new organization of which James Howard, a well-known Bedfordshire farmer, is President, and Mr. Bear, editor of the Mark Lane Express, is Hon. Secretary. This association announces eight objects, the most important of which seem to me to be these: Greater freedom in the cultivation of the land and disposal of its produce; security for the capital of tenants invested in the improvement of their holdings; reform of the game laws. Among the other objects is that of securing a better representation of tenant-farmers in Parliament, and this is made chief. The meeting to which I have referred was held in Exeter Hall during the Royal Show week. It was largely attended and much interest was manifested. Addresses were made by several members of Parliament—who were not able to forget their own interests—and by others, and the Alliance was almost unanimously indorsed. It was repeatedly stated that there was no desire to revive a protective tariff, and this was undoubtedly the view of the majority of those present, although a minority plainly manifested their dissent.

It seems to me quite probable this very serious crisis in the agriculture of the country—connected as it is with deplorable depression in almost all other lines of business—will result in very important legislative and social changes, which will give much greater liberty to the tenant-farmers, and affect the sport-loving disposition of the landlords, if indeed they do not change the land tenure laws in important points. A considerable emigration of tenant-farmers to British Colonies and to the United States seems also probable, and if the right men go, it seems clear the step will be a wise one for them.

Industrial Societies.

THE ROYAL AGRICULTURAL SOCIETY'S SHOW AT KILBURN.

LETTER FROM PROF. J. P. SHELDON.

LONDON, July 23.

KILBURN, you must know, is one of the suburbs of London, and the Show was held there simply because it was impossible to hold it in London proper, unless one of the parks could have been borrowed for it. The soil at Kilburn is of a most unfortunate character—the London clay, which is the stickiest and dirtiest in Christendom when the weather is wet; and as it happened this year the weather *was* wet. The Show yard was one huge slough of despond right up to the very edges of the tents and sheds, and sometimes inside them. Some heavy implements never got into position at all; they managed to get inside the Show yard, and there they stuck—up to the axles in mud. I heard of one engine that had disappeared altogether, and of men digging to find the funnel; but I cannot vouch for this. Anyway, the Show was a gigantic failure, on account of the wet. In itself it was simply grand; probably the finest Agricultural Show the world has yet seen; but it was a failure financially, for the Society, it is said, will lose £10,000 over it.

The leading feature in the Show, in the Live Stock Department, was the splendid display of Jersey cattle. All told, there were some 252 of them, and the quality was undeniable. Many American farmers have a great liking for Jerseys, and to such the display at Kilburn would have given great gratification. Probably some of your leading agriculturists were present. I saw one of your leading agricultural Professors there—Professor G. E. Morrow, of Illinois—and if so, they would come away with an increased admiration of the breed. It is evident Jerseys are coming into rapid favor in this country, if the number of animals exhibited at the Royal is any index to popularity, and I should be inclined to think it is. Mr. Thornton, our well-known auctioneer, is about to issue a Herd-book of the Jersey cattle, and this will help to extend their fame.

I cannot say if the Short-horn fever is waning in this country, but anyway, the entries in the Short-horn classes were much less numerous than in the Jersey ones. The quality of these grand cattle was, as usual, superb; but then, they are next to useless, except for fancy. Pedigree Short-horns lead glorious lives; "they toil not, neither do they spin;" they are tenderly cared for, and they see a great deal of the world and of society. These things spoil human beings sometimes, and no wonder the Short-horns have become mere ornaments. I was disappointed at the few entries of Ayrshires, because, as dairy cattle, I think we have none to surpass them. But, then, the Ayrshires are business-like, not show cattle; still, it is unfair to them not to bring them before the public who are so much indebted to them for many benefits.

The Polled cattle seem to be coming into favor. Many excellent specimens of Red Polled Norfolk and Suffolk cattle were exhibited. Really, the mere fact of having no horns goes a long way toward making these cattle a most valuable breed for dairy purposes. Besides, they are excellent milkers, very good beef makers, and withal very handsome. Being unarmed they are of peaceable dispositions, and this is a not unimportant consideration in both beef and milk-production.

Herefords and Devons, Sussex and Longhorns, the Welsh and Scotch cattle, and quite a nice little lot of Kerrys, were present in very commendable form. All of these, however, except the Longhorns and the Kerrys, are celebrated chiefly for beef, milk being, or having been, a secondary consideration in their breeding. A few Continental cattle were there, including several specimens of the famous Angeln breed. None of them, however, either for beef, milk, or comeliness, could compare with the Short-horns, the Ayrshires, the Jerseys, or the Norfolk Polled. Milky they were certainly, but they were loose-built and ungainly.

Our various breeds of sheep were well represented. The beautiful and woudrously compact Downs; the huge Cotswolds, Lincolns and Romney Marsh; the Leicesters, the Border Leicesters, the Cheviots, and the best-of-all Shropshires, were all grandly represented; but it would take many columns to do them anything like justice in detail, so I will leave details quite alone.

Berkshires, Shropshires, Yorkshires, Essex, and other types of the porcine world were there, and as nearly perfect as we can hope to see them. With you, however, I think pig-breeding is almost more advanced than with us.

THE NEW RASPBERRY "MONTCLAIR."

Horticultural.

THE NEW RASPBERRY "MONTCLAIR."

An engraving of a branch of this Raspberry may be found in the RURAL NEW-YORKER of Oct. 12 of last year. Many of the berries had been shaken off, and the engraving did not do justice as a representation either of the average size or the number of berries usually borne. We therefore selected what seemed to us a fair specimen, on the 6th of last month, to the careful engraving of which on this page, we now call the reader's attention.

This berry is a chance seedling (probably of the Philadelphia) discovered in 1872 in the grounds of the Messrs. E. & J. C. Williams, of Montclair, New Jersey. Six plants of it were sent here for trial last spring, and the present season they have been loaded with fruit. They passed the winter, so fatal to many varieties, without the slightest injury. The berries began to ripen about the first of July, from which date until the present time (July 26) we gathered, it seems to us, more than from any other six plants we have ever cultivated. They are uniformly large, firmer and of a better quality than the Philadelphia and of a somewhat brighter color when fully ripe. Extended trial may develop in the Montclair faults we know not of at present. But, judging it by the test of a single season, and by the test of the past six years in the grounds where it originated, we may hope it will prove among Raspberries what the Kittatinny, introduced by the same firm, has proven among Blackberries. We are not at present advised when the Montclair will be offered for sale.

SMALL FRUIT NOTES.

[The following notes are from an old and respected lady friend of the RURAL, now 73 years of age.—EDS.]

I plant Strawberries in a way a little different from that practiced by most people.

I have my ground well forked over for two months. As soon as the vines get through bearing, I begin to set the best young plants five or six inches apart in rows, and lay a board between the rows. They require very little weeding. The second year after bearing lift the board and place it on the old vines and you have a new bed without much labor. As soon as the berries begin to show red, I cover them with mosquito-netting to keep off bugs and birds, and the berries get thoroughly ripe. I cover my Raspberries in the same way.

You must not think I have many acres. My strawberry bed is about 50 feet square. From Wilson's I get the most berries. I can go out to-day and pick 20 quarts.

Tell RURAL readers to put one pint of salt and one pint of soft soap (it ought to be farmer's soap) to ten gallons of water and use it on Currants and Gooseberries. I'll warrant them a full crop. Put plenty of ashes—coal or wood—around the roots to increase the size of the berries.

Everywhere.

NOTES FROM NORTH CAROLINA.

Just two weeks ago I reported a partial drought that appeared to be ended by the longed-for showers. Those showers were light, and soon gave place to a rainless season of very intense heat. To aggravate the case, reports of far more severe drought came from many directions. A friend in our village has a daughter living in N. W. South Carolina, who wrote him that the weather had been so dry that the water in the wells, &c., was dried up and she had to send clothing three miles to a creek to find water enough for washing. In one part of Virginia it was necessary to drive stock a considerable distance to be watered. I think there has also been a drought in at least a part of Georgia. In North Carolina the distress has prevailed very extensively, and the injury to crops has been alarmingly great. The cotton has probably been injuriously dwarfed, but that plant has seemed to suffer less than any other growing crop. The tobacco that was planted early—which is relied on for the fine quality—is comparatively ruined. The product in this state and Virginia has certainly been very much reduced both as to quality and quantity. The forward corn suffered exceedingly. That upon the up-land has been dwarfed and, in some cases, dried completely. The summer grass is a *dead* failure. At last the rain has come. Yesterday the first good shower fell, and to-day we have had two refreshing showers. From all the reports and signs the rain is general, and the thirsty lands are, all around, receiving relief. The clouds still lower and promise to continue to be generous. Verily, these seasons of sweet relief beget gratitude in every faithful heart, "to the Giver of every good and perfect gift." How soon privation teaches man his helplessness and dependence on a higher power! After all, there is need of droughts.

In the State Normal School this summer, President Battle of the University, delivered a lecture to a large body of teachers of both sexes on the subject of "Higher special education for farmers." He justly taught that as the devotees of other occupations thought it necessary to seek special training and preparation, so the farmer, on whom *all* depend, should be carefully fitted and thoroughly furnished for his vocation. The address was well received. In truth, since the late war, there has been a great change in opinion and practice as to the proper relation of farming and education. We had again, in the Normal, Miss Coe of New York, the founder of the American Kindergarten. She had a large class of excellent ladies and the system is now well introduced into this State. Miss Coe is an enthusiastic, untiring worker. Her pupils presented to her a handsome testimonial, at the close of the session. Prof. Ladd, formerly of Mass., now of Va., presided again and conducted this pioneer State Normal of the South to a most gratifying success. A. W. M.

July 28, 1879.

NOTES FROM CENTRAL ILLINOIS.

Just now I am favorably impressed with "bagging grapes." Old Clinton vines which have lost their fruit for several years by rot and mildew, now present nice clusters in the bags, while those unprotected on the same canes are rotting.

Another season's observation confirms me in my opinion of the cause of Black-cap Raspberry blight; when the Rural some time ago, hinted at the cause of grape rot and mildew, and suggested the remedy, it might have included the Raspberry's trouble too. I think I have demonstrated in my garden that the so-called "blight," is an evil resulting from our method of training the briers, by cutting back, pinching, etc. But how are we to avoid pinching back our raspberry canes, and yet compel them to send out laterals? I don't see that we can and I hold that the injury is received from the nipping back being done improperly. To illustrate: Take two stools of Mammoth Cluster. A. comes along when the young canes are just the hight at which he desires them to branch, and with a keen knife he nicely takes out barely sufficient to arrest the upward growth, and no more. B. lets his stool alone till some day he comes along in great haste and, noticing his young canes, says: "My canes have grown too high," and hurriedly slashes and breaks them back a foot or so, to the point at which he desires them to branch, and in a few days he can probably tell A. that blight has struck his raspberry patch, particularly so if the weather and atmosphere have been adverse to the rapid healing over of the large and unsightly wounds he inflicted upon the young, rampant, succulent canes, left bleeding out their sap, not only to debilitate the plant, but scald the young bark, as it oozes down the cane in the blazing sun. The amputation, as a rule, of a finger, is not fraught with the danger that the amputation of a leg is, especially if both should be left bleeding, the finger having been taken off nicely, and the limb rudely. Learned Professors may bring to bear upon the diseased canes, their most powerful magnifying instruments in their search for theoretical causes, but let the fruit grower nicely nip out the tops of his canes as soon as they have attained the hight at which he desires them to send out laterals, barely taking off the uppermost bud, and at the same time experiment with a few by doing as B. did, in our illustration, and he will arrive at the true cause of the trouble much sooner than the microscope will. It may be foreign here, and unnecessary to say that tying raspberry canes to stakes is entirely needless work since they may be made miniature trees, standing up under their loads of fruit at least equal to the peach and plum.

Douglas Co., Ill. Dr. A. C. W.

RURAL SPECIAL REPORTS.

Conn., Georgetown, Fairfield Co., Aug, 4.—The Blunt corn sent me by the Rural is looking fine; it is setting from five to twelve ears per stalk; some of the stalks are 12 feet high and 10 inches in circumference. The Pearl Millet is six feet high and growing rapidly.

G. T. O.

N. Y., Orangeport, Niagara Co., July 26.—I planted my Blunt's corn on May 27, on a plot of ground measured off by itself in my pear orchard, 54 feet long and 12 feet wide. I made three rows inside of this plot, four feet apart and planted the kernels 14 inches apart in the rows. I planted 141 kernels but only 105 germinated, and as the weather was cold and dry for three weeks after planting, it "had a hard time of it," and appeared to be thoroughly tired out by the time it had got through the ground. I hoed it once a week for three weeks, and cultivated it once, and now it looks grand. It is just setting tassels, with a stalk as big as my wrist. My neighbors laughed at me the first month; but it makes them stare to see the change that has lately come over it. The prospects for other crops are very good, indeed. Wheat is all harvested and some have thrashed theirs. One man, near me, had 450 bushels of Clawson wheat from 11 acres; another had 670 bushels from 20 acres. The straw is short but the ears are well filled.

H. R. T.

Rural Farm, East Rockaway, Long Island, Aug. 1.—Plentiful rains have insured our crops against the drought before it had injured corn or potatoes seriously. It has been a delightful season, and any deficiency of yield will be due entirely to neglect or to timely cultivation. Blunt's corn (at last) has begun to set ears, and is a picture of vigor and health. Beauty of Hebron will produce a fine yield.

New Jersey, Brookside, Morris Co., August 5.—A rain and wind storm passed over here yesterday, and among other things it laid low was my Blunt's corn. Many stalks were broken off about two feet from the ground. I had 98 stalks; they were about 12 feet high and just beginning to tassel. I think the Acme tomato is not as good as it is thought to be. Mine decay at the blow end as they begin to ripen. I have cut some of the vines, some remain uncut, but this makes no difference in their decaying. The Canada Victor has beaten them by ten days in early ripening. J. D. T.

Pa., Factoryville, Aug. 1.—I notice in Rural for August 2 a report of the growth of Blunt's corn. Visitors to my grounds to-day express wonder at the number of ears set as high as ——well, higher than they can reach; but they can point to them, and think there is more room above, and a good prospect of a considerable space being filled above, beneath and all around, and the roots, like teeth, as high as one foot, are grinning to think that there is more in the ground than has ever been brought to light. The Rural must have sent out this giant feeder and space-consumer to wake up the drowsy powers of the husbandman, and draw on the resources beneath our feet and above our heads, and to be happy in the contemplation of what book-farming has done and is doing for the rising young men of America. J. W. W.

Ohio, Bloomville, Seneca Co., Aug. 4.—To-day we dug our Beauty of Hebron potatoes. From the one sent us, which had six eyes, we raised 45 potatoes, the largest measuring 11¼ by 7½ inches, and there were but few small ones among them. The corn is still growing; some of the stalks are 11½ feet high. Seven ears are the most we have counted on a stalk. The tomatoes are fine; but of the flower seeds very few came up—a mishap that causes some murmuring among the female portion of the family. The season has been pretty good—a little dry at times. Thrashing is now the order of the day. Wheat is turning out from 20 to 30 bushels per acre on the best land, and is selling at one dollar per bushel. M. Mc. N.

Illinois—Baileyville, Ogle Co., July 30.—The harvest is closing here. Some have their grain all in stack; others have some oats to cut yet, but soon will have finished. The weather has been favorable since the 10th inst., and harvesting has progressed rapidly. I have never known so much harvest work to be done in so short time and with so few hands. Improved machinery and good weather have caused this. The crops are variable, but mostly good. Winter wheat and rye are excellent, both in yield and quality. Spring wheat and barley were injured considerably by the spring drought and chinch bugs, so the yield will be below an average, but the quality is generally better than usual. The hay crop was quite heavy in this section, but a large amount of that which was cut early was damaged by the wet weather. The corn, potatoes, etc., are doing well and promise bountiful yields. The Beauty of Hebron potatoes we planted are proving very satisfactory. Some potatoes planted during the hot dry spell in May, failed to grow. Gardens are in fine condition, and vegetables are plentiful and cheap. The sowing of turnips, etc., etc., is now in order. We had timely refreshing showers on the 21st and 28th insts. Markets steady, though there have been recent fluctuations in the Board of Trade in Chicago. W. B. D.

Illinois, Kankakee, Kankakee Co., Aug. 4.—A welcome shower visited this place this morning—the first rain we have had for about four weeks. The corn crop had begun to suffer from drought, also the late potatoes. The harvest is finished and most of the grain and hay well secured. Some farmers have thrashed their wheat, and find it to be excellent in quality, plump and bright, yielding thirty bushels and over to the acre. Corn promises a large yield. Fruit, with the exception of apples, is scarce. Blunt's Prolific, what came up for me, is from ten to twelve feet high, and has from four to seven ears set on a stalk—whether it will all make corn is yet to be seen. The Beauty of Hebron potato received from the Rural had twelve eyes, which I planted on the 10th of April. The tubers have been ripe some three weeks. I dug them to-day and had a peck of very nice potatoes. I have not tested the quality of them to know if they will compare with the Snowflake which are very hard to beat. J. M.

Iowa, Fredonia, Louisa Co., August 5th.—My Beauty of Hebron potato I cut to single eyes—there were fifteen of them. For the sake of comparison I selected an Early Vermont of the same size, with eyes started to about the same extent; but as it only had thirteen eyes, I had to take two from another potato. Both sets were planted about the middle of April, the pieces about two feet apart in the row, the rows about three feet apart. The soil was a black, sandy loam, manured with common stable manure, at the rate of eight or ten loads to the acre. Early Vermont came up first, and looked rather the better for two weeks. The Beauty, however, finally passed it; its stalks were larger and more branching than those of the Vermont, but the leaves and blossoms of both looked just alike. The cut-worms took two hills of Hebron, and it was a long time before they sprouted again, and then were pretty slim, the two hills yielding not quite as much as one of the others. I dug them the first of August, and picked them up in an ordinary wooden pail. Of the Beauty I had the pail once heaping full and once not quite even full; of Vermont, I had a pail heaping full and about one-quarter full. Hebron had a little advantage in being planted on the back furrow, but I think the cut-worms offset that. It was the biggest yield, for the amount of seed, I ever beheld, and I never saw anything but the Harrison equal it for the amount of ground occupied. I cannot perceive any difference in taste or quality of Hebron and Vermont, and I don't think there is fifteen minutes' difference in earliness. They were hoed once and plowed once with a double shovel.

Blunt's Corn was planted the last Saturday in May, on dark, sandy loam. It came up in five days, a big, dark-green sprout, and grew faster for a while than any corn I had. I planted some deep-grained, brown corn (I sent you a sample) the day before on similar ground, but not so good, a part of it being quite light. It was longer coming, and did not look as well as the Blunt when it came, but it is now a long ways ahead, is all tasseled and some of the ears begin to top, while the Blunt does not begin to show tassel yet, and some of it is eight feet and some four feet high. I judged from the shortness of the grain it was not a tall-growing or late variety. I hoed it once—something not usually done to corn in this country—plowed once with double shovel and cultivated once with a two-horse cultivator. The other (Brown Canada) corn I cultivated once with a two-horse rig; the second time I found I was breaking so much while driving astraddle of the row that I had to finish it with a small one-horse plow, so it only got tended twice. Guess you will have to count me out of the premium list. I have sixty-four hills of Blunt corn, three feet apart each way, two grains having been dropped to each hill, and three grains in three hills. I believe every grain grew; it has not suckered at all. The planting was the last work of the week and I did not stop to measure the ground, but planted with a hoe, by step one way and by furrow the other way, and guessed it was within the required limits. I could not decide sooner where to put it where it would have a fair chance, and be where it would not mix with either my neighbor's corn or my own.

Since I commenced writing I have been to look at the corn; about half of it shows tassel, though it did not on Sunday, the 3d inst. Corn never looked better than at present all through this region. Early potatoes are a big crop and very fine. It has been a very hot, and some of the time, a very dry season; but when things began to need rain very much, it came, and plenty of it. Wheat, rye and oats were pretty good crops about here, but in this part of the country the chinch bug has done considerable damage—a large proportion of wheat hardly paid for harvesting, and a number of farmers did not cut theirs at all.

Hogs are dying of the cholera to some extent, though not very alarmingly yet. My nearest neighbor, out of a herd of forty has lost fifteen, and still they die. I have lost none, I have but a few and they are shut in pens and yards and can get nothing to eat or drink but what I feed them, and they have no place to wallow in the mud. I have but little fear of the cholera—though I may lose my pigs for all that. I know that beets and cabbage wilt less if the larger leaves are taken off when transplanted, but it takes too much time to clip them. They wilt and the sun burns off all the leaves they can't support; sometimes there are none left, but the plants live and thrive for all that. I never water sweet potatoes or any other plants, and I lose none. I think sweet potatoes do much better without watering, though the watered plants will look the best for a few days. I never use a dibble for setting sweet potatoes or tomatoes, but use it for other plants always.

H. I. B.

Iowa, Conway, Taylor Co., July 29.—Rye and oats are good. Wheat has been somewhat damaged by chinch bugs; it is nearly all cut. Hay is three-quarters of a crop. What few fruit trees we have in this part of the State do not bear much, but our orchard prospects are fine so soon as the trees come into bearing. Corn never looked better at this time of the year. Flax is not good, owing to dry weather in May. L. W. B.

Wis., Osseo, Trempealeau Co., July 27.—Wheat suffers from rust and chinch bugs; other crops are very good. J. O. E.

Missouri, Memphis, Scotland Co., July 28.—Our Blunt's corn is worth looking at. I have just measured some of it—one stalk, bearing four ears, measures to end of tassel eleven feet five inches, while another stalk having eight ears set, measures ten feet ten inches. These are, perhaps, just a trifle above the average. The Beauty of Hebron potato has done splendidly for us. This is comparatively a new country and "hard times" are harder upon beginners than upon those who are older settlers; our prospects, however, are excellent.

M. O.

Neb., Grand Island, Hall Co., July 27.—The weather continues very wet. Wheat is a fair crop. Corn never looked better. My premium corn is about eight feet high. It is of a dark-green color. My Pearl Millet I planted a little too early; it did not come up well, but what did come is doing finely. It is about three feet high. Prices here are as follows: wheat, 65c; oats, 33c; corn, 33c; rye, 25c; eggs, 10c; butter, 10c; hogs $2 to $2.50. W. H. M.

Oregon—Forest Grove, Washington Co., July 22.—We are having our dry spell here now. Haying is nearly over, and fall wheat is nearly ready for the harvester. The seed sent me by the Rural came safe and was planted with great care. I have eight plants of the Aquilegia, eight of Amorpha fruticosa; two of the Pinus edulis; some very nice beets and the very finest lettuce I ever saw. Everybody wants seed from it. Three weeks ago every leaf, except just the heart, was picked off from five of my plants, and now I have just measured them—well, two of them measure 36 inches, and the other three 34 inches, and they have had only common soil at that. I have a great many house plants, and the more I cultivate them the more I love them, and when by some mishap I lose a plant, it seems as if I had lost a friend. I well know that, for the working classes to buy and cultivate flowers, means fewer fine clothes as well as less plaiting and ruffles. But, I say "Give me my flowers and a plain dress." I find plenty of my more dressy neighbors glad to get slips from me, for they cannot afford to buy them. I do not wish to say that even I buy all my plants, for I get a great many by exchange, which, I think is a very friendly way. My husband says, the crop reports in the Rural are worth all it costs. For ourselves, we are both from your Empire State, which we left only seven years ago, and with the exception of a brother, all our relatives still live there in Delaware County.

Mrs. M. E. G.

Va., Mecklenburg Co., July 30.—The seeds sent me by the Rural, are all doing well. Of Blunt's prolific corn I received 140 grains of all descriptions, 15 were worthless, cracked,

decayed, etc. I planted 128 grains; 124 germinated and came up; 12 were cut down by cut-worms, and one other died from some cause, leaving me 112 hills standing. I planted it the 10th of May. It now looks very fine. If I don't get one of the premiums—if nothing happens to it—at any rate from the present indications I shall make more corn than I have ever seen made on the same sized piece of land. The wheat crop of our section is over an average one. The oat crop, however, is under an average. The tobacco crop is not a full crop. The corn crop, where well worked, stood the dry weather well. I can't yet tell how it will come in; rather over an average crop was planted, owing to the short crop of tobacco set out. The hay crop is short. The apple crop is large, and the peach crop rather over the average.

J. L. T.

N. C., Greensboro, Guilford Co., Aug. 1st.—After eight weeks of scorchingly dry weather, ending about the 23d of July, we have had fair rains now for over a week, the ground is now moderately wet, just in time to save the corn crop. Cotton land never looked better and now prospects are good for at least half or perhaps two-thirds of a crop on uplands. Taking it all together, prospects are good for an average crop. Turnips are now being sown; this crop is on the increase in this country, especially the Swede varieties.

J. VAN L.

GA., Atlanta, Fulton Co., July 30.—The weather here is damp; it has been raining for nearly a week without intermission. Corn and cotton are looking very promising. Early sweet potatoes are coming into use. We thought in spring that fruit would be scarce, but we find at this time that we even have a surplus. Apples are bringing 40 cents per bushel; peaches, 80c.; wheat, $1; corn, 75c.; labor, from $6 to $10 a month. C. D.

FLORIDA, Rixford, Suwanee Co., Aug. 2d.—Since my last report in June we have had a severe drought. We were nearly the whole of four weeks without rain. I estimate the corn crop damaged 20 per cent. Cotton, however, is looking well and the recent rains have materially improved it. Mercury from 70 to 85 degrees. G. C. R.

TEX., McKinney, Collins Co., Aug. 1.—A nice rain at last—corn cutting about over. Turnip sowing is going on with the best farmers (some never sow turnips). Pearl Millet is heading. "Kennedy's" Amber sugar cane does well here. Corn is now being injured by chinch bugs. Cotton will make half a bale an acre on an average, with present prospects. This has been an unprecedentedly dry year.

W. W. W.

The Querist.

ANSWERS TO CORRESPONDENTS

A Swindling Trick (?)

G. H, T., Granville, Mass., says that he has received circulars from Gaylord & Co., who claim to be proprietors of the National School of Design, Chicago, Ill. With the circulars came a blank coupon to be filled up with a number. He filled in a number and sent the coupon back; whereupon the kind-hearted Chicago chaps sent him a list of what he could have on paying "so much." For $25 forwarded, he is to get a prize *and* an oil painting; or, for $15 he is to have the prize alone; or, for $3 the painting alone; and he inquires if we know whether the concern is honest, and its promises reliable.

ANS.—We know nothing about this concern, except what is told in the plainest language by their method of doing business, as set forth by our correspondent, and that method declares them to be unmistakably a pack of bare-faced swindlers. Scarcely a day passes without our seeing in our "exchanges" several exposures of the tricks of just such bogus concerns that have assumed "high-sounding" titles the better to entrap the gullible and ignorant. Whatever you may want to buy, buy close to home, or at any rate where you can personally inspect it before investing your money in its purchase. Be sure you can get it most cheaply in that way. The dealers with whom you are acquainted, or with whom you can personally bargain, will sell you any article worth having, certainly at as low a figure as will those you have never seen. The method of sending out circulars and offering marvelous bargains to perfect strangers is always adopted by swindlers and never by trustworthy dealers. The greater the bargain offered by these knaves, the stronger the certainty of a complete swindle. Often they hint that it is through underhand or dishonest means they are enabled to make such offers. Yet even then they find fools enough to trust them with remittances, despite their self-confessed roguery; and in such a case an honest man can only rejoice at the certain loss and disappointment of the swindled greenhorn. Sometimes they go further, and offer to make their intended dupe an accomplice of theirs in some dishonesty—chiefly in passing counterfeit notes or coin—and in all such cases the unscrupulous rascal thoroughly deserves the loss he is certain to incur. We trust our readers will never invest a dollar or a cent in any of the swindling enterprises that fatten upon the folly, credulity or greed of the community, whether they are lotteries that guarantee prizes, mining companies extravagantly generous with their hidden treasures; land companies offering homes in the finest locations for a mere song, or art associations promising oil paintings for the price of lithographs

Stubborn Sweet-Scented Shrub Seed.

J. H. S. East Randolph, N. Y., has trouble with a seed of the Sweet Scented Shrub, Calycanthus floridus. She planted six seeds of this lovely shrub, five of which went to the dogs,—at least, they have mysteriously disappeared—but one still remains, and being anxious to raise a plant, she has coaxed that one to germinate by all the conceivable methods and means that her inventive faculties could suggest. She has put it in rich black loam, and then again changed it to a sandy soil, watered it freely and kept it dry, planted it indoors and out-of-doors, given it heat and cold, shade and sunshine, and still its temper remains unruffled. It has not even been provoked into swelling beyond its ordinary proportions, but obstinately continues the same as ever, round, fat, chunky and cheerful, its cool, shining, black coat scowling defiance at her whenever she takes it out of the ground to look at it (as she does quite often, we understand). Being at a loss how next to proceed, the seige suffers a temporary suspension and meanwhile she calls upon us for suggestions as to how to make it sprout.

ANS.—Indeed it is no ordinary seed that can with such hardihood baffle those persuasive attempts to make it grow, and what we can offer may be of little avail. In the case of people, we find, however, that coaxing is a poor means with which to persuade obstinate boys or whimsical persons of any age, and this is an analogous case. Since there is but a solitary seed, we would, in order not to loose it, put it in a small flower pot in quite ordinary soil, sink the pot in the ground to the rim in a shaded place, lay some moss over the pot, keep it moist and leave it alone; then, if the seed has not exhausted all vitality under its previous novel treatment, it will sprout in due time.

The Old Potato Beetle.

W. C. W., East Aurora, N. Y., sends us two specimens of a beetle, which he states is a new enemy to the potatoes in that section, and he would like to know what it is. It is a heavy feeder and quite destructive.

ANS.—It is Lytta vittata, the old potato beetle or the striped blister beetle. Pests of the kind are quite abundant in the Southern and Middle States, but their visits to the North are only occasional. The female lays her eggs in the ground from July to October; they hatch in about ten days and the larvæ, which Prof. Riley states feed principally on grasshopper eggs, undergo five moltings before they pupate, and having pupated, they remain in this state but five or six days, when they emerge perfect insects. There is but one brood a year. The beetle is from five-tenths to six-tenths of an inch in length and rather slim. The black wing-covers have a yellow stripe along the middle and are margined with the same color. The thorax is longer than broad, tapering a little forward and ornamented with three yellow stripes. The antennæ and legs are black and the body black, covered with a grayish down. They are quickly destroyed by Paris-green, and it is even stated that fine lime or plaster-of-Paris will drive them off.

Cultivating Corn in the Tassel and Silk.

H. W., Richmondville, Schoharie Co., N. Y., asks is there any danger in "working" corn when the tassel is in blow and the silk just coming out, lest the pollen should be jarred off, and fertilization be in this way prevented by the loss of the proper connection between the tassel and the silk; is there any other reason why corn should not be worked while in the above condition; his is grassy and he wants to cultivate it with a horse.

ANS.—The silk (female) is ready to receive the pollen from the tassel (male) when it matures. Jarring, therefore, is rather advantageous than otherwise. Corn may be cultivated even up to the time of the first stage of ripening of the ears. But it would in any stage after the silk appears be injured by any interference with the roots. Horse cultivation would, therefore, be injurious. Better let the grass remain.

Gone Where the Woodbine Twineth.

J. L. T., Mecklenburg Co., Virginia, wishes to know what has become of the New York Day Book Co. They advertised largely, offering great inducements to subscribers, and obtained a goodly number from his section, but the paper very soon stopped and the subscribers have seen nothing of it since.

ANS.—So far as we can learn, The New York Day Book Co. had an office at 96 Reade St., from which a few numbers of a weekly journal were published, but it has not been issued for a couple of months, and we understand that the company is broken up, so it will be useless for subscribers to expect the paper.

Miscellaneous.

D. M., Hawleyton, Broome Co., N. Y., asks, 1. what kinds of Magnolia would be likely to prove hardy in that part of the country; 2. where can they be procured; 3, when should they be planted; 4, how near can pumpkins be planted to squashes without danger of their mixing.

ANS.—1, Magnolias glauca, Fraseri, acuminata, tripetala, macrophylla, cordata. M. Lennei, which is hardier with us than any other of the Japan or Chinese species thus far fairly tested, might be tried. 2. All extensive nurserymen offer Magnolias. 3. Spring. 4. They cannot mix the first season, that is, the edible part. If it is desired to plant both near together, so as to save seed of but one kind, it would only be necessary to plant it earlier than the other and then save the first fruit that ripened. Of course, the flowers of the later planted would stand a chance of being fertilized by the other, so that seeds of it might prove to be "mixed." Bees etc. carry the pollen from one flower to another, so that a considerable distance must intervene to insure purity—at least 100 yards.

W. S. T., Upper Red Hook, N. Y., asks if there is any market for wild cherries, and the price of them.

ANS.—There is no general market for wild cherries, although they are used to some extent for medicinal purposes. The demand thus being local, there is no established price.

J. L. D., Meridian, Basque Co., Texas, sends a grass and asks its name. He describes it as growing from six to ten feet high, branching from every joint, making a heavy sod and that hogs fatten on the roots.

ANS.—Guinea Grass,—Sorghum halepense.

Various.

CIRCULATION OF AIR IN THE EARTH.

S. RUFUS MASON.

HAVING shown how moisture circulates through loosened soil, it remains to explain the aerification of the same. Upon the perfectly unobstructed circulation of water and air through the soil, depends almost entirely its ability to give up its fertilizing properties at the demand of the plant. All water contains, in a greater or less degree, some air, but this quantity will not be considered in this article, because it is never in sufficient volume to be of much value to the process of germination and fructification.

Supposing a soil in early spring to be saturated with water, there can be no air in it, because the two cannot both occupy one space at the same time. As the water subsides, the atmosphere must follow it, or there would be a vacuum. As the air occupies the space thus vacated, it acts chemically upon the soil, and thus evolves heat, and at the same time imparts its own natural heat to the soil.

Here we have the first effort to bring the earth into a condition favorble to plant life. If at this time cultivation takes place, a greater volume of air is admitted, and the soil becomes warm proportionably faster. At this time the moisture from below rises, and is, in the shape of what might be called a subterranean dew, mingled with the air from above, and by a chemical exchange, it is at once rendered a perfect solvent of the earth's fertilizing constituents.

Constant changes of temperature above ground, cause a circulation perpendicularly of moisture and air, each refreshing and invigorating the other—there can be no stagnant water, no stagnant air, as long as the sun's heat exerts its usual power. It is evident that in a solidly-packed soil, this circulation could not take place; that the earth would soon become dead, sour and totally unfit for living herbage. It is also evident that the unobstructed circulation of air and moisture in soils is absolutely essential to healthy growth.

As a proof of this, stop up the hole at the bottom of a flower pot, continue to water the plant *as usual;* and note how soon the roots are destroyed by dead water. Again, place a glass shade over a pot full of earth, having the hole at the bottom open; water from below, and note how soon the shade is filled with a fungus growth which will smother any plant growing in it.

Cultivation of the soil is the key to successful farming, and if applied at the time of need, never fails to pay amply for the labor spent. The time to cultivate (without having reference to the destruction of weeds), is whenever any cause so packs the soil that it cannot breathe freely. From the reasons given, it is also evident that frequently cultivated soil is both warmer and more moist, than that which is allowed to pack and bake.

Dodge Co., Feb.

WHAT OTHERS SAY.

FARMING DOES PAY.—When I learn, says a writer in the New England Farmer, that only one farm in twenty-five is paid for when bought, the wonder to me is, not that so many fail, but that so many succeed. When Richard Roe buys John Doe's farm for $7,500, pays $3,000 down, and gives a mortgage for $4,500 at eight per cent., expecting to make a living for himself and family, pay Mr. Doe $30 a month interest, and have a net three or four per cent. at the end of the year on $7,500, it brings no surprise to me that Mr. Roe finds such farming don't pay. What does the man own in fact? Just $3,000. That figure represents his capital. There is no kind of business to be found to-day, other than farming, in which $3,000 can be made to yield any kind of a living to a family without drawing on the principal. Men undertake too much on too little capital, and inevitably fail. It is not for the general good that farmers of this class should parade their misfortunes at every opportunity, misleading public opinion on a matter that lies at the very foundation of our national prosperity. Farming does pay, and pays well on the capital actually invested, with such general intelligent management as would be necessary in any other business. There is no other business which offers as good security for the investment; there is no other business which brings more contentment and less wearying anxiety of mind. The man who *owns* his farm and has three or four per cent. at the end of a year on the paid-up capital, after supporting his family, is actually in better condition than nine-tenths of the men in any other calling.

INFLUENCE OF MILK-COOLING.—In the Milch-Zeitung, M. A. Kirchner communicates the result of his recent observations on this point. He sets his milk for cream in two portions, one of which was uncooled and the other had been passed through a milk-cooler. Each portion was set partly in wooden troughs and partly in tinned-iron pans, and the experiments were carried on in winter, spring, and summer alike. The general conclusions arrived at were as follows:—1. There is no *essential* difference between cooled milk and uncooled milk, so far as cream-raising capacity is concerned. 2. The tinned-iron pans give a higher percentage of fat than the wooden receptacles. 3. In summer the yield of cream from the cooled milk is greater than that of the uncooled, because its souring is longer retarded. It is at this time of the year that the tin pans serve better than wooden troughs. The butter made from cooled milk keeps far better than that from the uncooled.

TENDENCY OF THE HIGH BREEDING OF FOWLS.—So things are coming to this pass, says a writer in the London Gardeners' Chronicle, that we are likely soon to have in England beautiful birds, "too good to be eaten," kept like race-horses, not for their utility, but to gain prizes—while our markets will be supplied with birds of no breed at all. For if, as I suspect, exhibitions tend to produce pampered, tender birds, whose eggs and chickens cannot be depended on in a bad winter like our last, those who rear fowls for market will gradually cease to buy their eggs, and will content themselves with hardier, commoner birds; and the fine birds, of superior size and excellence, which were to have been introduced into every farm-yard and cottage-garden when exhibitions had drawn attention to them, will but find their way to our tables.

CAPT. JACK STRAWBERRY.—Of all the different sorts on our grounds, this passed the winter and appeared the freshest and greenest in spring. The deep green of the leaves continued all through spring and afterwards. It bears profuse crops—more so than any sort except the Wilson, and is fully equal to that variety at its best. It has two defects—the berries are hardly large enough to be popular in market, and it is rather acid and not high flavored. Perhaps the Crescent may come up to it in bearing another year, but it has not yet, while it is larger and better in quality, judging from this year's trial. So says the Editor of the Country Gentleman. Capt. Jack is worthless with us—small, sour *and* unproductive.

ENCOURAGEMENT OF DAIRY WORKS.—With a view of encouraging the native dairy industries in Germany, the Minister for War decided some weeks ago, that cheese should henceforth form a part of the soldier's ordinary ration. It is also stated by the London Farmer that similar arrangements have been made by the Minister of the Interior in the dietary of prisoners under confinement, and that the various agricultural societies have been requested to point out to the authorities the dairies in different parts of the country which are prepared to supply cheeses for prison use at low prices.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, AUG. 16, 1879.

TO WHOM IT MAY CONCERN.

INSTEAD of 50,000 extra numbers of the RURAL NEW-YORKER, as heretofore stated, we now *guarantee* an extra issue of 60,000 for our Fair number. It will be made up of 28 pages, including the cover. Many original engravings and articles from the following writers are either received or promised: Dr. J. B. Lawes, of Rothamsted, Eng.; Professor J. P. Sheldon, of Cirencester, Eng.; Professors I. P. Roberts and G. C. Caldwell, James Taplin, Henry Stewart, Pres. T. T. Lyon, M. B. Batcham, M. B. Prince, M. C. Weld, Professor L. B. Arnold, W. I. Chamberlain, J. B. Armstrong, William Falconer, J. T. Lovett, Col. F. D. Curtis, S. Parsons and others.

We may also state that our next Free Seed Distribution will be fully and definitely announced. In reply to many inquiries, it may be said that our rates for advertising in the Fair Number will be the same as in any other number. Advertising copy must be received prior to the 25th inst.

We again invite agents, secretaries and our readers to send for as many copies as they may be willing to distribute or to hand to their friends. They will be promptly forwarded free of charge.

POTATO PROSPECTS IN ENGLAND—THE POTATO BEETLE.

The probabilities of our crop returns, (RURAL NEW-YORKER, June 21st,) which so far as we know were the most voluminous of any ever before gathered together in this country, are fast becoming certainties. The truth of our summaries as regards wheat, rye, oats, grass, etc., has already been attested. We predicted that "Potatoes will be cheap"—and that prediction seems very likely of realization too. At all events, it is probable that the crop will be an abundant one, and if the price should rule high, it will be because the potato crop in other countries will prove insufficient for home use. There seems to be no longer a question that this will prove to be the case in Great Britain. The London Garden of latest date has the following:

"THE POTATO DISEASE—This sad visitation is now affecting early sorts of potatoes generally, and a continuance of the present weather can but lead to its wholesale appearance amongst all kinds, and in all parts of the kingdom. * * * It seems useless to hope for better weather, as summer is passing away so fast, that even should it come, it will be too late to benefit many things. The disease would appear to have struck potatoes on the Continent even before it has appeared here, and if the crops are as largely affected there as has been stated in the daily papers, there will be but few foreign potatoes to import. This fact should induce importers to look to America where they have had some hot weather, and whence, perchance, may be found a fairly healthy crop." Fears are then expressed, that the "regulations regarding the Colorado Potato Beetle may interfere with our imports from that quarter." "Should prices reach the high figure during the winter that is anticipated, there will be a great outcry if it is found that the American crop is practically excluded from our markets."

It is time that European people gave themselves some rest as regards the potato beetle. Years ago, its depredations were great enough to justify the gravest fears. But that is past, and the potato beetle has in truth become one of the most harmless of all our common insects injurious to vegetation—because so easily controllable. We have no doubt that the preventive measures adopted by foreign countries will cost them more than the potato beetle, even should it obtain a foothold upon their soils.

COST OF FIRE INSURANCE.

In the RURAL for August 2d, we printed an article from L. A. R., relative to the cost of insurance, arguing that the expenses of conducting the business of fire insurance in New York, were much greater than they should be.

We have before us a table showing an abstract of the report of the joint stock fire and marine insurance companies of the State of New York doing business in this city. From this we learn there are 83 such companies with a total capital of $24,107,020, and a net surplus of $16,676-767.26, making a total of nearly 41 millions of dollars. The total income of these companies, including premiums for insurance in trust or capital invested, &c., was $10,029,118.86—and the cost of managing the business was $4,071,783,02. Thus it will be seen that of every dollar the companies have received, more than forty cents have been spent in getting and managing it.

Now, we believe that the insurance business in New York can be done for less than 25 per cent. of the receipts, and still pay good dividends to stockholders, by reducing the number of companies and increasing the capital of the remainder, employing only such official and clerical help as is needed, cutting off sinecures and breaking up rings, whether made up of families or friends; in a word, managing the business in a business way—the same as a good merchant or manufacturer manages.

Do you point us to lists of directors and note the names among them of some of the most intelligent and prosperous business men in the country? We reply that not one in fifty of them attends the meetings of the board at all, and when they do, they know little more of the business of the company than the stockholders at home. The directors, as a rule, do not direct at all, except perhaps two or three who, with the President and Secretary, run the concern. Shall we give an idea of these Board meetings?

Called to order by the President—Roll call—Payment for attendance—Minutes of last meeting read—Statement of business since the last meeting,—Adjournment—all occupying, we venture to say, not more than half an hour. This, we think, will be a full average of time spent in the boards of all the companies in New York.

Perhaps the average amount of salaries paid to officers is not too great, although, we think, in many cases more and better service could be obtained for the money paid. We have in mind one instance in which a large sum is paid to a President, who could not, if the company should be discontinued, get a clerk's position elsewhere on account of age and infirmities. He has been with the company many years, and has outgrown his usefulness. But the Board of Directors of that company is made up of his relatives and friends—one of the board told us that any member who should move a reduction of salary would be left off the list at the next election. We hold the laborer is worthy of his hire, and one who has learned the insurance business after years of experience, should be well paid, but the barnacles and other obstructions to the ship's motion, should be cleared off. The fire insurance business needs overhauling.

HARDINESS OF THE JAPAN PERSIMMON.

"At a late meeting of horticulturists at Cleveland, Ohio, the Japan Persimmon was alluded to as of 'doubtful hardiness,' which, perhaps, was a safe expression, considering our present knowledge of this fruit. But one of our contemporaries, published in this city, in noticing the above expression of opinion, says: 'There need be no doubt about it. It is not hardy or any approach to it.' This is what we call a decided and positive opinion, given without positive knowledge, for there are trees of the Japan Persimmon growing near this city which withstood the severe cold of last winter without the least protection, and are now healthy and making a vigorous growth. We call this at least an 'approach' to hardiness, and it is quite possible as well as probable that among the scores of varieties of the Japan Persimmon there are some as hardy as our native species. It would certainly be well to at least give them a trial before asserting that they are worthless."

The above is from the agricultural editor of the N. Y. Sun, and the RURAL NEW-YORKER is the criticised journal. Diospyros Kaki was advertised in our columns by one of our first nursery firms, viz., The Parsons & Sons' Co., of Flushing, L. I. It was, therefore, to our interest to say all the good that could be truthfully said of it. It was at first supposed that it would prove hardy. It has since been so injured in Flushing, as we learn from the Messrs. P. themselves, as to make it very apparent that it can never be trusted to mature fruit in this latitude — or, rather, in this climate. Hence we say it is not hardy. The opinion was "decided and positive," and we hope it has guarded our Northern readers against spending their money for fruit trees which, if cultivated without protection, will never yield them fruit. There may be varieties of the Japan Persimmon that will prove hardy here. We do not know anything about that. There may be varieties of figs that will stand our winters without protection. As soon as "positive knowledge" exists to that effect, we shall naturally hasten to publish it. We are under the impression that Mr. James Hogg told us that Kaki had endured several winters in his *garden*, which is in the suburbs of New York city. Perhaps it fruited there. We could mention instances, however, where many plants were injured and many killed outright by the vicissitudes of last winter, which were not remarkably trying vicissitudes, either.

A SOFT ANSWER.

W—was a well-to-do merchant in the village, and owned a large but good-natured cow. C—was a farmer living near town, who, with the aid of his children had raised a fine crop of corn to the stage to be tempting to mischievous stock. C—was very poor and quick-tempered. Seeing W—'s fine cow, with many others, grazing near his fence, he imagined that she would some day break in and destroy his chance for bread. He hastened to W. and excitedly said: "Have you a large, white-spotted cow?" "Yes," answered W. "Well, you *must put her up*!" "Why?" asked W. "Because, if she gets into my corn field and turns other cows in, *I'll kill her*," said C. angrily. "Very well," said W., "if she gets in, kill her." "I WILL kill her if she gets in," said C. still more angrily. "All right," said W. "I have nowhere to put her, and do you kill her if she gets in. But what are you so mad about?" "Because you tell me to kill the cow," said C. Then W. told him to sit down and hear him a moment, and said: "Mr. C., though I'm not rich, the loss of my cow will not be very serious to me. I can get another, and my wife and children would not go to bed hungry on account of such a loss; but you depend on your corn for bread and you can't afford to lose it. So, if my cow breaks in, kill her; let me know so that I may save the hide, and I'll never say a word about it." "Is that what you meant?" asked C. "Yes." C. was touched and humbled; and he said that he would not hurt that cow for anything; but that, if she should break in, they would try to hobble her, or in some way keep her out without injury. Verily "a soft answer turneth away wrath."

MR. CHARLES DOWNING.

The life of this venerable gentleman has been an uneventful one. He has never startled the world by any great discoveries, inventions or even by his writings. And yet there are few who, by their perseverance, industry and study, have added more to the world's knowledge in any branch of information than Mr. Downing has added to our knowledge of fruits. And this he has accomplished in a manner so unobtrusive of self; so destitute of the vanity that marks the career of many men who aspire to fame's proud hights, that all who know him, or know of him, entertain an unqualified respect for his character as well as an appreciation of his good works. The portrait upon our first page is drawn from a recent photograph, which Mr. Downing presented to the writer. "Will you give us permission to publish it," we asked. "No," was Mr. Downing's prompt and emphatic reply. And, yet, we have presented it to our readers. We do not believe that any man who has striven to render so much service to mankind, is altogether justifiable in shrinking from the natural curiosity as to his personality, which his life's work has created.

Destroying Plantain.—It is worthy of remark, that the common Plantain—Plantago major—may at this season of the year be easily pulled up, and lawns may be rid of it with comparative ease. Its roots suffer by drought, so that by this time they form a compact bundle, but an inch or so in length. Take *all* of the leaves and flower spikes in the hand and with as low a hold as possible, and the roots will offer but little resistance. This method, if adopted *now*, will be found far more efficacious than cutting them out or applying sulphuric or any other acid to the leaves or "heart." This last measure is, in practice, one of the vagaries of the horticultural mind. One day last week we pulled up not less than 200 plants in an hour or less.

England's Crop Prospects.—Dr. J. B. Lawes, of Rothamsted, in a private letter to one of the editors, makes the following statement:

"We have had a season so unusual that no records can be found to compare with it. Since April 1st, a period of 111 days, we have measured rain on every day except seven. The consequences are becoming very serious in regard to the harvest."

BREVITIES.

A NEIGHBOR tells us the best crop of Rutabagas he ever harvested was sown August 14.

THE Gardeners' Monthly notes that an insect similar in its effects to the phylloxera upon grape-vine roots, causes many Clematises to "dwindle away."

THERE is a great deal of dissatisfaction expressed that Anchor instead of Telemachus 9th did not take the Champion prize among Shorthorn bulls of Kilburn.

WE hope some of the RURAL readers will win the $150 silver cup offered by the Massachusetts Horticultural Society for the best twenty-four hybrid perpetual Roses.

A BRITISHER, with whose prosperity the sale of American products had specially interfered, was wicked enough to express his regrets to John Bright that "the cursed country had ever been discovered."

OUR occasional contributor, L. S. Hurdin, tells the London Agricultural Gazette that he has met many successful farmers who believed in the moon, but has yet to meet the successful dairyman who buys his cows by the escutcheon.

THE transposition of a single letter or figure sometimes makes an appalling difference. We stated last week that the Prince of Wales was married in 1836, which was about four years before he was born. Instead of 36, it ought to have been 63.

WE learn that Professor C. L. Ingersoll of Michigan State Agricultural College, who for three years past has most efficiently filled the important chair of Professor of Agriculture in that institution, has resigned that position and accepted a similar chair in Purdue University at La Fayette, Indiana, the change to take place September 1st, 1879.

OF late we have seen a great many boxes of flowers in the windows of stores and dwellings. After a while we detected a striking resemblance both in the boxes and the plants with which they were filled. Finally we read upon these boxes in red and blue letters a *soap* advertisement. Surely this is a novel and excellent, though costly method of advertising.

WE call attention to the reports of our subscribers who are testing our Blunt's corn. Up to within a week or so, all have spoken of its surprising hight and vigor. Now many report that each stalk is setting several ears. We need not anticipate by any guesses or by the expression of sanguine hopes. A few weeks will determine just what Blunt's White Prolific Corn is.

MR. WILLIAMS, of Montclair, brought us half-a-dozen each of the Beauty of Hebron and Early Ohio potatoes, all of large size. He requested that we should cook and eat each kind separately and report which we liked better. By mistake all were cooked together. They were eaten by six persons, not one of whom could detect any difference in the quality or flavor.

REV. A. J. HOUGH, in a poem read at Woodstock, Conn., upon the Fourth of July, thus nominates a farmer for President:

By right of service duly paid;
By right of worth, if justly weighed;
By right of numbers, fairly told;
By right of fitness, grit, and gold;
A *farmer*, blunt, outspoken, shrewd,
Ambitious for his country's good,
The bells with ringing peals present
As candidate for President!

We could mention a score of names that contribute to the RURAL's columns that we should vote for if nominated. Let's have a farmer for our next President! But shall he be a practical or scientific farmer? Here is where the party might split. We should only ask that he be a *good* farmer and an *educated* man.

WE may now promise positively that the announcement of our next Free SEED DISTRIBUTION will be published in our FAIR number to be issued in about three weeks. We handed the list to one of our prominent seedsmen with the request that he would estimate its value to those who desire the plants and seeds enumerated. His reply was: "They are nearly all novelties and would cost the purchaser at retail—if they could be purchased at all—not less than $2.50."

A GREAT deal has been said about Mr. Mechi and his Tiptree-Hall farm. It is well known that it was a poor farm when he bought it in 1841. It has been thought that Mr. Mechi's system of agriculture has much increased it in value. But Mr. Clare Sewell Read, M. P., says that he was told by a local agent that if the land were sold to-morrow, it would not realize above $25 an acre more than what Mr. Mechi calls the unimproved farms of the neighborhood, notwithstanding the small fortune that has been spent upon it. "Is high farming a remedy for low prices?"

THE New York Herald copies, with complimentary comments, an article from the RURAL and gives credit to the Lancaster Farmer, upon the subject of hide-bound trees. The article in question appeared on this page in our issue of Dec. 1st, 1877, page 358, and the credit is therefore due to us. The Herald, in its farm department, at least, is careful—so far as we know—to give due credit wherever it has occasion to copy from other journals. Our reproach is against the Lancaster Farmer. The Herald says that the Lancaster Farmer's "suggestions on agricultural topics are always valuable." Very likely!

H. F. H. Lexington, Ky., makes the following statement in the Gardeners' Monthly respecting Japan Persimmons: "They are certainly a failure. Trees planted here last fall are dead mostly, winter-killed root and branch. The sooner the public are aware of the unhardy character of the tree, the better. Agents will sell at least one thousand dollars' worth of the stock in this country this season, from which unadvised purchasers are not likely ever to realize aught but disappointment." If anybody has counter evidence as to the hardiness of the Japan Persimmons, we shall be glad to place it before our readers.

Literary Miscellany.

TYPOGRAPHICAL ERRORS OF MY FIRST POEM.

Ah, here it is! I'm famous now—
  An author and a poet!
It really is in print! ye gods!
  How proud I'll be to show it!
And gentle Annie! What a thrill
  Will animate her breast,
To read those ardent lines and know
  To whom they are addressed.

Why, bless my soul!—here's something strange,
  What can the paper mean
By talking of the "graceful brooks
  That gander o'er the green."
And here's a T instead of R,
  Which makes it "tippling rill;"
"We'll seek the shad," instead of "shade;"
  And "hell," instead of "hill."

"They look so"—what! I recollect,
  'Twas "sweet" and then 'twas "kind;"
And now to think the stupid fool
  For "bland" has printed "blind."
Was ever such provoking work—
  'Tis curious, by the by,
How anything is rendered blind
  By giving it an eye.

"Hast thou no tears," the T's left out,
  "Hast thou no ears," instead.
"I hope that thou art dear" is put
  "I hope that thou art dead."
Who ever saw in such a space
  So many blunders crammed?
"Those gentle eyes bedimmed," is spelt
  "Those gentle eyes bedammed."

"The color of the rose" is "nose."
  "Affection" is "affliction:"
I wonder if the likeness holds
  In fact as well as fiction.
Thou art a friend," the R is gone;
  Who ever would have deemed
That such a trifling thing could change
  A "friend" into a "fiend!"

"Thou art the same" is rendered "lame!"
  It really is too bad;
And here, because an I is out,
  My "lovely maid" is "mad."
They drove her blind by poking in
  An eye—a process new;
And now they've gouged it out again
  And made it crazy, too.

"Where have the muses fled, that thou
  Shouldst live so long unsung;"
Thus read my version—here it is—
  "Shouldst live so long unhung."
"The fate of woman's love is thine,"
  And H commences "fate;"
How small a circumstance will turn
  A woman's love to hate.

I'll read no more! What shall I do!
  I'll never dare to send it!—
The paper's scattered far and wide—
  'Tis now too late to mend it.
Oh Fame! thou cheat of human bliss!
  Why did I ever write!
I wish my poem had been burnt
  Before it saw the light.

Let's stop and recapitulate:—
  I've dam'd her eyes, that's plain;
I've told her she's a lunatic,
  And blind, and deaf, and lame.
Was ever such a horrid lash
  In poetry or in prose?
I've said she was a fiend, and praised
  The color of her nose.

I wish I had that editor
  About a half a minute,
I'd BANG him to his heart's content
  And with an H begin it.
I'd JAM his body, eyes and bones
  And spell it with a D.
And send him to that hill of his—
  He spelt it with an E.

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER V.—(CONTINUED.)

As she spoke Miss Carew turned her back on the astonished woman and swept across the room, leaving her visitor to make as dignified an exit as circumstances would permit. A vigorous slam of the street-door was Elizabeth Yorke's parting salutation to the actress, who had stood white and rigid as marble till the sound aroused her. Then the girl broke down, and, sinking on to the hard, little lodging-house sofa, she buried her face in her hands and burst into an agony of tears.

"Oh, I cannot bear it!" she sobbed. "The cruel woman! Why did she come here to-day of all days in the year? Was not my fate hard enough already? Oh, Jack, Jack, if you could see your poor child now!" and Miss Carew's slender shape was convulsed by the force of her bitter weeping.

"Will he be at the theatre to-night?" she thought suddenly, as she started up and with trembling hands pushed the damp hair back from her face. "Did he recognize me yesterday, and will he be cruel enough to come and look at me across the great gulf that divides us, knowing that I may not stretch out my arms to him and ask him to take me away—away from this narrow miserable stifling existence and these dreadful people—from the mean hopeless future I have sold myself to? Oh, if I only dared cry to him to come and take care of me! But I must not. Oh, Jack, my darling, I pray that you may go away, and never know how near you stood last night to your poor Olive—that I may never see your dear face again—never, never!"

And again the bitter sobs swelled in the girl's throat as she tried vainly to control herself.

"Ah, I shall have all my life to cry in!" she thought at last, rising and beginning to tidy the room with a few rapid touches, and to remove the traces of agitation from her face. "Let me try to do my duty with as little complaining or fuss as possible. It is for Nelson's sake. I must remember that!"

And Nelson, coming in at that moment to call his sister to her long-delayed dinner, was caught in her arms and held to her breast with an anguish of devotion that the boy almost divined.

"Has any one vexed you, dear?" he asked, looking up into her face with his eager unnaturally-bright eyes. "I wish I could bear all your troubles for you, Olive."

Then Olive had to laugh, and to declare that her trouble was nothing more serious than a headache brought on by her long rehearsal and the stage-manager's bad temper, and to eat her dinner and "make talk" as though there were no such things as love and pain and parting in the world. Then there was still her meeting with the Doctor to be gone through before she set off for her work. Robert would be sure to look in, she remembered, as he had not seen her all day; and the poor child prepared to receive her middle-aged lover with even a prettier welcome than usual, smoothing her hair, and fastening a knot of violets in her belt, and stirring the fire into a pleasant blaze.

"It will be dusk," she thought, as she peered anxiously into the dim oblong mirror that adorned the mantlepiece. "He will not see that I have been crying. Men do not like crying girls, I think. And how could I tell him the cause of my tears? It is not his fault that Miss Yorke has been so cruel and so coarse. I will never let him know what has occurred to-day." And with this brave resolve Olive sat down to await her lover's knock.

There was silence in the little parlor, for Nelson, who had not been deceived by his sister's light words and laughter, had seen that she was suffering, and had left her to rest quietly by herself—silence, but no repose for the girl whose heart was thrilling with vague longing and doubt and dread, as she recalled the events of the last twenty-four hours. In vain she pressed her hands upon her eyes, trying to shut out the face that had been looking through her dreams all night; in vain with such thoughts as were making her veins throb and her cheeks burn, as she sat all alone in the dusk, she told herself that it was wicked to think of any man but the one she had promised to marry. She was so young. The life she accepted stretched before her so cold, dreary, endless; the life that might have been glowed in such happy colors before her yearning eyes. Many changing pictures she saw in the red heart of the fire; many a remembrance they awoke, many a regret; swiftly and surely they carried her back to the days before she had known Woolchester, Dr. Yorke, and trouble and care—carried her back to the unclouded summer of three years since, when she had fulfilled her first engagement at the pretty sea-side town of Yarborough.

Once more she saw herself walking on the level sunshiny sands, a budding girl, conscious down to her very finger-tips of her beauty and charm and power of pleasing, walking in the sunshine that had faded for ever. Once more the fresh sea-wind was whistling keenly in her ears; once more kind glances were meeting hers, and filling the world with happiness and light—glances that seemed to follow the young actress everywhere—glances of respectful mute admiration, of grave and tender interest, and of something warmer still. The handsome bearded man who met her so often in her walks came to the little bandbox of a theatre every evening, and Miss Carew's gorgeous bouquets were an object of much comment and much good-natured envy on the part of the other girls in the company. Yet Olive did not even know her admirer's name, and scarcely cared to know it. She was happy, filled full of life and hope and health; her soul was in her work: her heart—ah, her heart was not awake just yet!

Then came a day—oh, how well remembered!—when Miss Carew put on her crisp white muslin gown, and fastened a creamy rose in her bright hair, and went—very proud of the honor—to dine with her manager. And somehow it was not a surprise to her to find that even here she met the tall handsome man with the gray eyes and heavy moustache, who was introduced to her as Colonel Dacre, and who had brought another bouquet—all creamy roses and cool-tinted heliotropes, which completed the actress's simple toilette to perfection, and which he begged her in a very low voice to accept.

After some time they were engaged. The season was drawing to a close. Olive had a winter engagement to fulfil, but Colonel Dacre declared that he would not part with her—that he was jealous of every hour she devoted to the stage. He had money enough; his mother would love Olive, he assured her; there was nothing at all to hinder their marriage. But, as they were walking one evening towards the theatre—where Colonel Dacre would leave Miss Carew at the stage-door before he went to bury himself for the evening in his box—as they were walking along like two children, hand in hand, and Jack was telling Olive for the hundredth time what she wore and how she looked and what he felt on the day he first saw her on the sands, they were met by two ladies in a carriage—a handsome dignified woman with Jack's clear-cut profile, and a saucy little blonde dressed in bright blue from head to foot, who beamed all sorts of pretty mischief at Colonel Dacre, as they drove by, and who looked with undisguised interest at the beautiful pale girl by his side. Then Olive felt somehow that she was beginning to wake out of a dream, and that the golden September evening was turning bleak and cold. And before long the story had to come out.

The blonde young lady was Colonel Dacre's cousin. They had been betrothed since childhood by their parents' wishes; neither cared one bit for the other, but to break their engagement was to forfeit a large property. "That is all!" Jack pleaded in his loving kind old voice, and with his adoring longing eyes; and again he swore that Olive should be his wife—he would never give her up—he would die without her! But Miss Carew was proud, and, though her heart was breaking, she would not listen to any more words of love from another woman's promised husband. She could give no answer but tears and sobs to all his desperate prayers and entreaties; she would never see him again till he was free—released by his cousin—from his promise. And so, having taken the friendly old manager into her counsel, without a last word, without a last look at Jack Dacre's beloved wretched face, the actress stole away one day from Yarborough, and left her heart behind. For three long years she heard nothing of the man she could not help loving still. She believed he had forgotten her, but she prayed for his happiness, after her prayer for Nelson, every day. Then some one spoke of him as winning honors in Africa, and she read his name in the newspapers, and knew that he had been in danger. After that she could think of nothing but his safe return, even though he might have come back to marry his pretty blonde cousin, and could never be anything to Olive Carew again. But now!

"Oh, why does not Robert come?" thought the girl, getting up restlessly and going to the window. "Why does he leave me here to think such thoughts, and to remember what it must be the work of my life to forget? When he comes," she added, as she stood with her flushed cheek pressed to the pane, "I will tell him everything, and I shall ask him to let our marriage be soon. I will give up the rest of my engagement if he wishes it, for when I am really his wife I shall be stronger. Oh, I do want to do what is right, but it is very hard!"

The evening was wearing away, and still Dr. Yorke did not come. It would soon be time for Miss Carew to go to the theater; she looked anxiously at the little clock.

"I can wait half an hour longer," she thought, nervously clasping and unclasping her fingers. "What can be delaying him?"

There was no answer but the ticking of the clock and the light fall of the ashes on the hearth. Olive went back to the fire and sat down. But the stillness of the room oppressed her—a kind of terror seized upon her.

"I cannot stay here!" she cried, beginning to tie on her bonnet in feverish haste. "Robert is not coming; I must go alone. Oh, Jack, I wonder if you are thinking of me now! What would you say if you knew that your 'little child' was walking through the streets all by herself at night—you who would not let the wind blow too roughly on me, my darling, in the dear old days? How happy I was then! How strong and kind he was! How close and warm he used to wrap my shawl round me when the nights were chilly! Ah, I must not remember any more! Only Robert may take care of me now. And he is very good; he will come to-morrow, no doubt—very likely he is busy to-day. Ah!" A knock at the street door shook the little house at that moment, and Olive started, in mingled relief and dread. "There he is!" she cried. "I knew he would not forget me."

She was tearing off her bonnet and shawl and running to the fire, which was getting low, as footsteps were heard on the stairs. Obedient to her touch, a brilliant light went dancing through the room. The door opened.

"Ah, you are late, sir!" she said gaily. "I shall scold you, I——" She turned round. "Jack!"

The tall figure at the door opened his arms, and, with a low sobbing cry, Olive Carew ran to him and fell upon his breast.

CHAPTER VI.

Dr. Yorke brought the same gloomy face to dinner that he had worn, after his sleepless night, at breakfast. He had had a very hard day's work, and had been prevented by many engagements from paying his usual afternoon visit at his *fiance's* lodgings. But, in spite of his failure that morning, he had called again on Miss Carew as he came home, and he had been told again that Miss Carew was not at home. The doubt of the day before was now becoming a certainty. Perhaps a look into Olive's face and a few words in her sincere voice would have saved him from the thought; but, as it was, he told himself that she had gone to meet that man—her lover—and that she was trying to deceive him, whose promised wife she was. Jealous rage burned in the Doctor's heart as he dispensed the soup and carved the fowls. His food tasted bitter. The good wine almost choked him.

Poor Gertrude, after one or two timid attempts at conversation, shrank back frightened at his melancholy face, and was not reassured by the unusual liveliness of Aunt Elizabeth's manner, or the nods and becks in which that lady indulged from time to time. The meal was like a nightmare to two of those who sat at the table, and it was a relief to all when Miss Yorke, having finished her glass of claret, rose and went away with her hand on Gertrude's plump waist, leaving the Doctor to his own gloomy reflections. But no sooner was Gertrude seated at the piano than Miss Elizabeth, announcing that she had left her key-basket in the dining-room, returned to the scene of torture.

The Doctor was sitting with his elbow on the table and his hands thrust into his hair. The wine stood untasted at his side; he looked up with such a haggard face, when the door opened, that Miss Yorke almost lost courage.

"Robert," she said, with unwonted gentleness, and laying her hand on his shoulder, "what ails you to-day? Is there anything wrong? What have Gertrude and I done that you shun us and have not a word to say?"

The kind tone went to the Doctor's heart, which was very sore just then. He touched her hand gratefully in reply.

"You look tired," she continued. "You are working too hard, Robert. What is the use of toiling and slaving and making yourself old before your time, as you are doing?"

The Doctor's dark face flushed.

"Why, aunt, what am I but an old sober fellow?" he said, sadly. "Hard work is what I am fit for. But I believe I am a little over-tired to-day."

"Do you think I can't read you better than that, Robert Yorke, after living in this house for twelve years? I know very well what is in your mind, although you try to hide it from me—your own mother's sister."

"What do you mean, my dear aunt?"

"I mean that you are unhappy about that—about Miss Carew—and you have good reason, my poor boy!"

"Who dares to say a word against Olive?" the Doctor exclaimed, springing up, and facing his tormentor. "I will listen to——"

"You are accusing her yourself, you poor fellow," Miss Elizabeth returned, with a touch of pity in her voice. "What did I say against her?"

"You said she had given me cause for unhappiness. What did you mean?"

"I'll tell you. No—I won't! She shall tell you herself—perhaps you'll believe it then!"

Pale and fierce the Doctor stood, while Miss Yorke produced the letter she had stolen and held it out.

"Read that, Robert," she said, with ill-suppressed eagerness, "and you will find—written in her own hand—that the reason she could not see you to-day was that she had an appointment with—another man, who is her lover!"

Smothering an exceration, Robert Yorke snatched the paper and turned away.

"Leave me alone," he muttered hoarsely. "For Heaven's sake leave me to myself!"

And so Miss Elizabeth shut the door softly upon his misery, and went up-stairs. For a long while the Doctor sat and looked at the letter which was to wreck his happiness, struggling manfully with the temptation which bade him prove for himself the faithfulness and deceit of the fair woman who had seemed to him so high above other women in her fearless candor.

"I have a right to read it," he repeated desperately, over and over again, as his heavy eyes turned towards the crumpled paper that lay far off on the carpet, where he had flung it from him in his first burst of self-contempt. "I have a right to read it." But still he sat on in the deserted dining-room, staring blankly at the letter, and did not touch it.

Doubtless, he assured himself, the contents would prove Olive's innocence of anything beyond a mere imprudence—to him, at least, if not to Miss Elizabeth, who was prejudiced against her—so that, for his darling's sake, it was even his duty to read what must clear her from any further suspicion. But still he did not pick up the letter. A thousand wild thoughts were chasing each other through his brain meanwhile. He would wait for her at the little iron gate, and fling her perfidy in her teeth. He would burn the hateful scrawl, and take Olive away from Woolchester on the morrow, and let who dare say one word against her when she came home—his beloved, honored wife! He would give back the letter unread, and her promise with it, and never see her again. But that man—the man who had followed them last night—the man at the sight of whom her face had blanched and her voice faltered! Was it to seek out Olive that he had come to Woolchester? And should he, Robert Yorke, abandon the girl who would in so few weeks have borne his name, to the tender mercies of a villain who had won her heart and cast it from him, since Olive had herself admitted that she loved a man whom she could never marry? Great drops started to the Doctor's brow as he remembered this.

"It is to that man the letter is addressed," he muttered fiercely. "I must know what she has written to him." And he strode across the room and picked up the letter. "It is too late in the day for scruples or hesitation."

Smoothing out the little crumpled ball, the unhappy man tore the letter open, and read it hurriedly through—he did not spare himself one word; then the pretty familiar handwriting swam before his eyes, and the paper dropped from his hands, as he flung himself down on the table with a cry of despair. It was all true then—there was no longer any doubt—and that girl's calm, sweet face was nothing but a mask.

Robert Yorke writhed under the blow. The passionate words addressed to another, the ridicule of the writer's elderly suitor, the assignation at an hour when his ungainly presence could cast no shadow on the delight of the lovers' reunion—how it all seemed burnt into his jealous heart! And Olive Carew was false—false—false!

"I will not sleep to-night until I have given her back her word," he thought at last, lifting his haggard face, and wiping his forehead with feverish shaking hands. "The few short weeks of our engagement that were so happy to me—such a torture to her, poor child—I cannot give these back, nor the kiss I took from her cold sweet lips last night, but she shall be free henceforth. I will trouble her with my ridiculous importunities no more."

A few moments later the Doctor was on his way through the deserted streets to Olive's lodgings, the April stars shining in the dark and tranquil sky, and the night air feeling like a cool hand laid on his aching head. He could not trust himself to call for her as usual at the stage door, to face the friendly words and jests of the company, the false pretty smiles of the girl who had so wronged him. But he would wait for her at the same spot where they said good-bye every night—only now it would be good-bye forever. The time he had so often dreamt of, when, by patient striving, he should win his wife's love, and should feel her strange, bewitching coldness melt before his man's ardor and devotion, would never come to him now. Hope and joy were dead since Olive Carew was false. Nothing but memories was left him.

Thinking thus, and puffing drearily at his cigar, Dr. Yorke found himself approaching the little iron gate, against one of the pillars of which he saw, with some irritation, that there was a man's figure lounging, motionless and dark, his arms folded, his hat drawn down over his brows.

"Confound the fellow!" thought the Doctor, throwing away his cigar. "Why does not he go into the house if he belongs to it? What business has he to be prowling about just when Miss Carew is expected back? She must not walk home alone any more. I——"

Here the man who was waiting at the gate turned and looked wistfully up and down the

obscure street, and the light of a lamp close by falling on his face revealed the long red beard and gray garments that the Doctor had seen before on the club-house steps. Robert Yorke recoiled. Could it be possible that Olive had so insulted him as to choose that spot of all others for the rendezvous she had given her lover? Would she be vile enough to stand there, where only last night she had of her own accord lifted her lips to his, and let another man talk to her of love—kiss her? What manner of man could he be who could thus endanger the actress's reputation?

Poor tortured Robert Yorke did not wait to remember that the stranger might fairly have asked the same question of him; already he was striding back by the way he had come. "She is not worth the anger I have wasted on her!" he groaned, clenching his hands as he walked. "She is utterly heartless, faithless, disloyal! Why does Heaven make such women beautiful that they may wreck the lives of honest men? How shall I live the years that are left to me, knowing that Olive Carew is false?"

He was so absorbed in his own miserable thoughts that he did not see Miss Carew, when presently she passed him under the fatherly care of the old prompter, who lived in the same street, and who felt very proud when the pretty girl asked him occasionally to see her safely home.

"Surely that was Dr. Yorke, my dear?" the old man said, using the friendly theatrical privilege in so addressing his charge.

Olive started, and, turning round, called softly after the retreating figure of her lover. But he did not hear her—he was listening to harsher voices that were making an angry tumult in his breast.

"No, it cannot have been Dr. Yorke," sighed Olive. "Here I am at home, Mr. Wright, and I am so much obliged to you—good-night!"

"My dear, the obligation is mine," returned the little prompter, with his best bow. "Don't forget the 'call' is ten o'clock to-morrow."

As Miss Carew opened the little iron gate the man who had been waiting there advanced and spoke her name.

"Don't go in yet," he said in a low voice, as she made a gesture of dismissal, and he caught her hand and held it to him. "Olive, give me one word before I go away."

Olive stopped, trembling from head to foot.

"Why are you here, Colonel Dacre?" she asked hurriedly. "It is unkind after what I have told you. Let me pass; I have nothing else to say."

"Unkind!" echoed the man with a short unmirthful laugh. "Olive, you are going to kill me, as surely as if you put a bullet into my heart—to kill the good that is in me—and you talk of my being unkind because I ask you for a word at parting!" The uncertain lamplight fell on his face as he spoke, and showed it to be distorted with suffering and passion.

"What is it you want me to say?" asked Olive, hopelessly. "I must not stay here talking to you—you have no right to waylay me in the dark."

"You have forbidden me your house—what else can I do?"

"You must go away," answered the girl hurriedly—"away from Woolchester; I must never see you again."

"Olive"—the young man crushed her trembling hand in his, and flung it from him with a groan—"Olive, can you speak of it so coldly? Never see me again? Oh, try to think, dear, what that means! Never to meet any more—never to hold each other's hands or hear each other speak—never to bring back the sweet old days—oh, Olive, can you speak of it so coldly?"

"Why should not I be cold, Colonel Dacre?" Oh, let me go—please let me go! If my—my lover were to see you here!"

"Your lover?" The young man laughed again dismally, and seized her two poor trembling hands in his. "Do you think I have forgotten how you ran to meet me last night? You have no lover but me. Oh, darling child, why will you torture me with such foolish words?"

He would have laid her head down on his breast, but Olive struggled from his clasp.

"I have a lover," she panted desperately, "and he is good and kind and true! I will never be false to him."

The young man drew back deadly white, and looked her fixedly in the face. Olive could not endure the silent misery of his gaze.

"Oh, Jack, Jack," she sobbed, melting suddenly into a great burst of tears, "can't you see that my heart is breaking, and that I must not listen to you, unless I want to prove myself the falsest, wickedest girl in all the world?"

"You are the truest and the sweetest Olive," said poor Jack Dacre, trying to speak as gently as though he were not on the rack of conflicting emotions; "and that is why you will not be led by any false idea of self-sacrifice to make us both utterly wretched for life."

"Oh, don't—don't, Jack!" sobbed Olive, rocking herself in uncontrollable agitation. "I am cowardly enough already. Oh, help me—don't make it harder for me, dear!"

"Listen to me, love," urged the young man passionately. "You gave me your promise long ago, and I have never given it back. You left me because you thought I was bound by a promise made for me before I was old enough to know my own mind. I have come back after three years of loneliness and misery to tell you that I am no longer bound by that promise, and you——"

"I am bound by a promise now," said Olive, growing calmer—"a promise made of my own free will in return for so much true kindness, so much generous goodness, that I will die rather than break it. Jack, is it you who are asking me to be false to my word? You would not wish surely to marry a woman you despised? Do you think I would come to you, my one dear love, with such a slur upon my honor?"

Jack Dacre could only gaze with his hungry heart in his eyes at the girl whose very nobleness of thought was making it all the harder for him to relinquish her to another man. There was a pause, in which they could hear the beating of their hearts and their hurrying breath. Then Olive held out her little shaking hand.

"Say good night now, Jack, and good-bye," she faltered, growing very pale. "I love you better than all the world, but I will marry Dr. Yorke."

The young man caught her in his arms, and looked with despairing passion into her sweet wet eyes.

"My poor little brave foolish child," he whispered hoarsely, "if you could only understand the doom to which you are devoting yourself! Olive"—he stooped and pressed kiss after kiss upon her white quivering lips—"you send me away from you, but I will come back! I will bring some one who will persuade you better than I can. This is not good-bye, my dearest—it is only good night."

He has gone. Olive, her pulses throbbing with blended pleasure and pain, stood and listened to his footsteps dying away along the dimly-lit street; the lamps were flickering in the light wind; the branches stirred overhead with a low unhappy sound.

"No—it is good-by," she said, opening the little gate, and walking slowly towards the house. "It is good-by to Jack and love and joy for ever."

(To be continued.)

H. M. S. PINAFORE.

The Opera in Providence—A Real Ship on Real Water—An Enjoyable Performance.

An audience of between 2,000 and 3,000 assembled at the Park Garden last evening to witness the opening performance of the comic opera "H. M. S. Pinafore" in the open air and "on a real ship on real water." There had been a fear that the singing, and especially the dialogue, might not be distinctly heard, even by those of the audience nearest the ship, but this fear was almost entirely dispelled. With one or two exceptions, after they got fairly into it, both singing and dialogue were heard easily to the furthermost portions of the audience. The chorus of the sisters, cousins and aunts, as they left the landing in the small boats to board the ship, was very pretty. The good ship Pinafore, moored in the lake, is 110 feet long. She was fully rigged, and a man-of-wars-man present pronounced her exceedingly well gotten up. Her sails were "loosed to a bunt-line," her gun-deck ports were closed, but on the main deck were four broadside and two boat-howitzers; there was the wheel in front of the cabin, the capstan, the ropes coiled up around the fife rail, the starboard anchor down—in short, it was a good representation of a ship of war. The orchestra was out of sight, in the forecastle, but not "out of sound." The action was in the center of the main deck, and when the sailors departed they went down the fore-hatch, while the Admiral, the Captain and his lovely daughter, and the sisters, cousins and aunts disappeared at the proper times into the cabin. When Little Buttercup came on board she came in a boat alone, was met at the starboard gangway by a gallant tar, and sang the first stanza while in the boat. The sisters, cousins and aunts arrived in the same way. When the boat containing Sir Joseph and Hebe arrived there was a commotion on board. There was a salute, and the yards were manned by men who were as agile and evidently understood what they were about as though they were real man-of-wars-men. Then there was a file of marines who did their duty, notably the silent drill, so well as to win merited applause. When the Admiral left the ship with Hebe he sang his "I'm Monarch of the Sea" after he had boarded the small boat and while preparing to start. And over all and above all was the strangeness of the surroundings, the water and the sky, the reflection of the opera in the lake, the trees, the immense audience scattered around the shore of the lake, giving a novel, not to say wierd, appearance.

And there was an element which it is no risk to say never before entered into a representation of "Pinafore," and one which created a good deal of amusement in a quiet way. This was a couple of frogs—perhaps more, but two at least—who played their little part. One was the father of all frogs, or, better, grandfather, whose position was at the left of the lake, and the other was a fellow of no mean voice at the right of the lake. They had evidently not been at all the rehearsals and didn't always come in just at the right time. (By the way, why not train these frogs and utilize them in the Frog Opera? No charge for this suggestion, Mr. Reeves). For instance, when Ralph was pouring his "simple eloquence" into the ears of Josephine, Grandfather rang out "chuur-ur-rough!" three or four times, which might have meant to suggest to Ralph that he knew he was giving "taffy." The presence of the frog chorus at some of the tender passages was decidedly novel; and at one time, while Josephine was singing a solo, it was a matter of doubt whether she or the frogs would come out best, and bets were offered quite as freely on the frogs as on her. It was funny to hear Little Buttercup sing:

"Bulls are but inflated frogs,"

and then "chur-ur-r-ungh!" in disgust from the grandfather, or to hear Sir Joseph say, "Love levels all ranks," to be met with "e-r-r-r-a-euck" from the frog at the right; or to hear the frog chorus mingled with

"Never mind the why or wherefore,"

or Sir Joseph sing:

"And the lord that rules the water,"

with the disdainful rejoinder—"jug-o-rum, jug-o-rum," or Josephine,

"And the tar that ploughs the water,"

with the congratulatory "chur-ur-r-ungh." But these examples are enough to give an idea of the fun that was not on the programme. "H. M. S. Pinafore," after the same form and manner, will be given at the Park Garden until further notice. —*Providence Journal.*

If you are ambitious to move in the highest circles join the next expedition to the Artic circles.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

BIRDS OF NO FEATHER.

BY MARY B. PEEKE.

Four little birds in a nest too small,
Only one mamma to care for all:
'Twas chirp and twitter the live-long day,
No wonder the mamma soon grew grey.

Papa-bird was a dashing fellow,
Coat of black with a flash of yellow:
Never a bird in the early spring
Could rival him when he chose to sing.

He helped the mamma-bird hang the nest
Where the winds would rock it the very best;
And while she sat on her eggs all day,
He'd cheer her up with a roundelay.

But when from each egg in the swinging bed,
A little birdie popped its head,
He said to his wife, "I've done my share
Of household duties, they're now your care."

Then off he'd go to a concert fine
In the apple-trees and bright sunshine
Without a thought of the stupid way
His poor little wife must pass her day.

At last the mamma-bird fell ill,
And the papa forced, against his will,
To take her place with the birdies small,
Ready to answer their chirp and call.

Sorry day for the wretched fellow,
Dressed so gay with a scarf of yellow!
Shut in the house from morning till night,
Was ever a bird in such a plight?

* * * * *

At eve he said, "Another day
Would turn my goldenest plume to grey;
Or else in a fit of grim despair,
I'd fling these children into the air!"

Have I mixed up birds with human folks?
And homes with nests in the lofty oaks?
The story is true, and I overheard
Those very words of the papa-bird.

But who he was, and where he did dwell,
I'll never, *no never*, NO NEVER tell!
The truth for once is truth for aye,
And this is the reason why mammas grow grey.

[*Wide Awake.*

"HOME PROTECTION."

An Argument for Woman's Temperance Ballot.

BY FRANCES E. WILLARD,
PRESIDENT OF ILLINOIS W. C. T. U.

THE CATHOLIC CHURCH, GERMANS, ETC.

The attitude of the Catholic Church was friendly to our petition, many priests urging their people to sign. Irish women, as a rule, gave us their names, and saloon-keepers' wives often secretly did so. Scandinavians were generally enthusiastic for the petition. Germans opposed us; but the reply of one of them indicates the chivalric nature which will come to our aid when our invincible argument against beer shall be brought in contact with German brain and German conscience. He said: "If it is not the pledge, I will sign it. I cannot give up my beer; but I want to help the ladies." To be sure, German saloon-keepers were universally and bitterly antagonistic, and had much to say about "women keeping inside their proper sphere."

ARGUMENT FROM THE NATURE OF THE CASE.

But the convictions which supply me with unalterable courage and unflagging enthusiasm in the Home Protection work are not based upon any proof I have yet given. No argument is impregnable unless founded on the nature of things.

The deepest instincts and the dearest interests of those who have the power to enforce a law must be enlisted for its enforcement before it will achieve success. For instance, the 15th Amendment to the Constitution of the United States is going to be enforced by the ballots of colored men who once were slaves, just so long as those men retain their reason and their color. By parity of reasoning, if you can enlist in favor of a local option or prohibition law the dearest interests of a class in the community which in all the ages of wine and beer and brandy drinking has not developed (as a class) the appetite for them nor formed the habit of their use, you will have something trustworthy on which to base your law. We temperance people have looked over at the rum power very much as the soldiers of Israel did at Goliath of Gath. We have said: "He has upon his side two of the most deeply-rooted instincts of human nature—in the dealer the appetite for gain, and in the drinker the appetite for stimulants—and we have nothing adequate to match against this frightful pair."

But, looking deeper, we perceive that, as God has provided in Nature an antidote for every poison, and in the Kingdom of His Grace a compensation for every loss, so in human society he has ordained against King Alcohol, that worst foe of the social state, an enemy beneath whose blows he is to bite the dust. Take the instinct of self-protection (and there is none more deeply seated.) What will be its action in woman when the question comes up of licensing the sale of a stimulant which nerves with dangerous strength the arm already so much stronger than her own, and which at the same time so crazes the brain God meant to guide that manly arm that it strikes down the wife a man loves and the little children for whom when sober he would die? Dependent for the support of herself and little ones, and for the maintenance of her home, upon the strength which alcohol masters and the skill it renders futile, will the wife and the mother cast her vote to open or close the rum-shop door over against that home?

Then there is a second instinct, so much higher and more sacred that I would not speak of it too near the first. It is as deep, but how high it reaches up towards Heaven—the instinct of a mother's love, a wife's devotion, a sister's faithfulness, a daughter's loyalty! Friends, this love of women's hearts was given for purposes of wider blessing to poor humanity than some of us have dreamed. Before this century shall end the rays of love which shine out from woman's heart shall no longer be divergent; but through that magic lens, that powerful sunglass which we term the ballot, they shall all converge their power, and burn and blaze on the saloon, till it shrivels up and in lurid vapors curls away like mist under the hot gaze of sunshine. Ere long our brothers, hedged about by temptations, even as we are by safeguards, shall thus match force with force; shall set over against the dealer's avarice our timid instinct of self-protection, and match the drinker's love of liquor by our love of him. When this is done you will have doomed the rum power in America, even as you doomed the slave power when you gave the ballot to the slave.

OBJECTIONS.—WOMAN'S INFLUENCE.

"But women should content themselves with educating public sentiment," says one. Nay, we can shorten the process; for we have the sentiment all educated and stored away, ready for use in brain and heart. Only give us the opportunity to turn it to account where in the least time it can achieve the most! "No; but she should train her son to vote aright," suggests another. But if she could go along with him, and thus make one vote two, should we then have a superfluous majority in a struggle intense as this one is to be? And then how unequal is her combat for her right to train her boy! Enter yonder saloon. See them gathered around their fiery or their foamy cups, according to the predominance in their veins of Celtic or Teuton blood. What are they talking of, those sovereign citizens? The times have changed. It is no longer tariff or no tariff, resumption of specie payments, or even the behavior of our Southern brethren that occupies their thought. No. Home questions have come elbowing their way to the front. The child in the midst is also in the market-place, and they are bidding for him there, the politicians of the saloon. So skillfully will they make out the slate, so vigorously turn the crank of the machine, that measures dear to them will triumph, and measures dear to the fond mother's heart will fail. Give her, at least, a fair chance to offset by her ballot the machinations which imperil her son.

WOMEN CANNOT FIGHT.

"But women cannot fight," you say, "and for every ballot cast we must tally with a bayonet." Pray tell us when the law was promulgated that we must analyze the vote at an election, and throw out the balance of all men aged and decrepit, halt and blind? Do not let the colossal example of Judge David Davis so fill our field of vision that we cannot perceive brain and not bulk, to be the rational basis of citizenship. Avoirdupois counts greatly among the Zulus; but is a consideration far less weighty with the Americans than it was before the Geneva Arbitration. I venture the prediction that this Republic will prove herself the greatest fighter of the nineteenth and twentieth centuries; but her bullets will be molded into printers' type, her war will be a war of words, and underneath the white storm of men's and women's ballots her enemies—state rights, the saloon, and the commune—shall find their only shroud.

"WOMAN'S RIGHT."

Of the right of women to the ballot I shall say nothing. All persons of intelligence, whose prejudices have not become indurated beyond the power of logic's sledge-hammer to break them, are convinced already. For the rest there is no cure save one—the death-cure—which comes soon or late and will open more eyes than it closes. Of the Republic's right to woman's ballot I might say much.

(To be continued.)

LETTERS FROM A COUNTRY GIRL—No. 16.

MARGARET B. HARVEY.

If, as my fair friends remember, I have confessed to having the "art craze," I form by no means an exceptional case. This universal interest in art matters is a good thing for our land. To-day, instead of talking about Huxley and Darwin, as our people did three years ago, they are discussing Morris and Eastlake; instead of gravely speculating over the philosophy of the unknown and the unknowable, they are actually making for themselves discoveries in the realms of the beautiful. And the result of it all is going to be lovely homes everywhere—our hearth-worship will soon be conducted within worthy temples. And I want to be one of the messengers to carry this good news to the women far away from the centers of artistic influence.

I was hesitating whether to tell first about the old masters, or to talk of art as regards some of its manifestations to-day; and I have come to the conclusion that I will, so to speak, give my pupils something to do, and let them out of their doing evolve a desire to learn of persons and principles preceding their performance. It is well enough to read and talk about art, but what you, my friends, really want is art in your homes. If you have been able to follow any of my suggestions about decoration, you are already in a fair way to obtain what you desire.

I used to think it impossible for those in ordinary circumstances to derive much profit from the modern school of artistic adornment. In one sense, I still think so—that is, so far as concerns costly materials; but in another, I think they may be greatly benefited—when it comes to the consideration of *effect*, aside from the means employed. And as my friends have been very indulgent in listening to my experiences from time to time, perhaps they will be equally so now if I tell them how I furnished a parlor this summer,

An Artistic Room.

As in many country houses, the room had simply a whitewashed wall. This I brushed over very carefully, filling in the cracks with the thick paste from the bottom of the lime-bucket and smoothing them over with an old knife. Then out of the barn I got a great quantity of the beautiful thick heads of the Hungarian grass, and with them I made a long wreath, tying them together with ravelings which I had saved from my coffee-bags, of which last more anon. (Save everything you can). This extensive garland I fastened along the top of the wall with lath-nails, thus forming a beautiful frieze. For a center-piece, I arranged in the middle of the ceiling a bunch of Hungarian grass, from the midst of which, suspended downwards and the handle mostly cut off, was a large, gay Japanese umbrella.

The paint on the wood-work, of a soft grayish white tint, was in tolerably good condition, so there was nothing for me to do here. The next step in order was a dado to correspond with the frieze, and this I made by tacking all around the walls, immediately above the washboard, white straw matting a yard wide. Thus I had a beautiful wall, the pure white contrasting exquisitely with the *ecru* straw above and below. And as the carpet must correspond with frieze and dado in general tone, and contrast strongly with the upper wall and ceiling, I covered the floor also with straw matting.

There should also be a general correspondence throughout hangings and furniture though anything like "matches." or "sets" are strongly tabooed. So don't be surprised to be told that I used a great deal of coffee-bag, which, aside from its being a truly artistic material, (we will not mention its *cheapness*) was of the same order as my straw wall-decoration and floor covering. I next put in each of the four corners of the room a bracket made merely of pine wood and covered completely with a coffee-bag lambrequin fringed out and bordered in double coral stitch worked with pale-blue zephyr. The lambrequins for the curtains consisted of deep flounces laid in shallow plaits, fringed out also, and edged with the pale-blue. The curtains themselves were plain lengths of unbleached muslin, looped back on each side with bands of the bagging worked in the blue, (N. B. Unbleached muslin curtains may be bordered in crewels, edged with torchon lace, or bound with strips of bright-colored cretonne). To complete the effect around the sides of the room and to correspond with the center piece of the ceiling, in each of the three vacant spaces on the walls—at the back of the room, and at the two sides—I tacked up two Japanese fans, with their handles crossed and tied with blue ribbon.

I next looked about me to see what I had available in the way of furniture,—and you, my friends, if you look, will probably find more than you thought. Well, I found a beautiful old side-board, or pier-table,—neither, in fact, but half-and-half, with a marble slab on top, a number of mahogany curves, inlaid with wreaths and harps of satin wood, and a shelf underneath. It would just stand between the two windows. And then I found a plain, dark wood table, which a few strokes of my brush weighted with Vandyke brown, applied about the legs rendered quite respectable. Besides I lighted on a very pretty camp-chair, with blue carpet back and seat, another camp-chair, quite different, being old and worn, and furnished with a bottom of dingy, faded brown; and a cane rocker.

The first thing taken in hand was the plain table, for which I made a cover of a large piece of coffee-bag, fringed also, like the lambrequins and bordered with blue. In the center of it I laid a heavy moss-mat for the lamp, and this is how I made it. I cut a round foundation of cardboard and covered it, on the top with bag-stuff, on the bottom with muslin. Then I got three ounces of blue zephyr, each ounce a different shade.

The Moss Stitch.

—If it is a stitch—is exceedingly simple, though the effect is magnificent. First thread your needle with the zephyr, knot, and pass it through the edge of the card-board. Have ready in your left hand a long bunch of zephyr, consisting of three or four strands. Pass the needle through about half an inch from the end nearest you, knot around it, and then cut the running bunch half an inch from the thread, so that you will have taken upon your needle and secured in place a bunch of strands about an inch long. Upon the same thread, still held in your right hand, take up another bunch in the same manner, about an inch higher than the last, and so continue until you have sewn upon one string five bunches, then cut the thread itself. Put the needle through the card-board for the second time, very near the first thread, and proceed as before. Keep on until you have gone all the way around, when perhaps you will be surprised to find that only one row has used up an entire ounce. The second row should be placed a good inch within the first, and the third within the second, forming three concentric circles. The richness of the completed work must be seen to be appreciated.

I made another mat for the under part of the other table. This was a daisy mat, more beautiful, perhaps, than the other. The border was blue fringe, and immediately overlapping it was a row of white daisies, alternating with blue rosettes. These latter were made simply by winding the zephyr over the fingers, tying it tightly in the center, cutting the ends and pulling them out. The daisies were made in the same way, but of white, a small yellow rosette being fastened in the middle. This mat, however, pretty as it was, was only a foundation for something better, for upon it I placed a pot which I had decorated in the Japanese style. It was a graceful, curved vessel, somewhat like a butter-crock. The bottom was pure white, shading gradually downward as the pot swelled upward, into a soft gray, darkening into a greenish black, reaching an absolute black around the rim, relieved however here by a thin band of bright vermilion. Around the greenish part ran a row of tiny, brilliant Japanese fans. And within this receptacle I placed a large bouquet of dried grasses.

Upon the marble top of the stand were laid a few books, beside which appeared a dainty, rustic vase containing fresh-cut flowers. Also, a fair silver easel, suspended upon which by loops of light blue and garnet ribbon, was a horseshoe,—decorated by sprays of buttercups painted upon a black ground.

The blue camp chair did very well as it was. So did an old lounge-frame, it being an easy task to give it new youth and beauty by a covering of blue chintz,—a lovely fabric of a delicate shade overrun by roses and doves and daisies and Cupids and Apollos and arches and arabesques, in soft grays and clear whites. To lay on the floor in front of it, I worked a long sofa strip of the bag-stuff, with shaded blue in large cross-stitch, lining it with the same material,—coffee-bag mats should always be lined, otherwise they will not lie nicely. —The faded camp-chair, I transformed by a bag-seat, bordered on each side by a broad band of perpendicular and horizontal diamonds, in shaded blue. I tacked to the back of the cane rocker a daisy tidy, made by threading together five rows of rosettes, each containing five,—a daisy, a blue, a daisy, etc., alternately. This, of course, was sewed fast diagonally.

Now, I wanted three more chairs. So I bought a camp-chair of still a different pattern, and two light wood rockers, without backs and seats. I covered the first with a most elaborate piece of the bagging material, transformed "so fashion:" down the middle I basted first a broad band of garnet poplin, and then upon it, along each side, I worked a row of conventional asters in pale-blue split zephyr. These I enclosed with converging and diverging stiches in yellow silk. Out upon the bag I worked two stripes of blue and yellow, in cross-stitch, finishing the front by deep knotted fringe in the same blue and yellow wool.

Of the two rockers, I finished one with the plain bag, bordered in cross-stitch with pale blue. For the other, I used up all the scraps left from the bags I had used, cutting them into strips, hemming them and resewing them together, over and under. Then upon every other of the squares so formed, I worked a large star in shaded blue.

Lastly, I believe I shall tell what I had upon the four-corner brackets. First of all, though, I shall say how I covered up the old stove pipe hole. I stretched over it a square of white muslin, and then in the middle, so as to hide the round part, I tacked a blue tile, painted with a spray of daisies. To return to the brackets. In one corner I had a little wooden placque adorned with a yellow dandelion; diagonally opposite was another placque with a bunch of apple blossoms. Upon each of the others was a pearl shell, upon which I had painted little landscapes—one, a gnarled apple tree laden with sunny blooms, with a background of woodland and sky and cloud; the other, a bit of the woods in spring time, showing the emerald green of the budding beeches, the deep malachite of the cedar, and the red and silver of the oak, with here and there a dash of the pure white dogwood.

And oh! the room was sweet! Sweet, sweet, sweet beyond description. I wish you could have seen it, but alas! it exists no longer. However, I shall never forget it, and I hope to create it all again some day. One item I must not omit to state—the whole cost only *sixteen dollars!* Don't you believe now that you can have lovely things if you try? To be sure, I did everything myself from the painting down to the whitewashing and tacking and scrubbing. But don't be discouraged if you can't paint—there are ferns, and corals, and shells, and Japanese fans, and Florida moss, and butterflies, and birds' nests, and ever so many things. I know you can put your knowledge of art to an every-day use if you will.

ADVICE TO GIRLS.

Now, girls, do not be disgusted and say, "We've had too much advice already." Please give this a careful perusal and some earnest thought. The whole matter "in a nut-shell" is simply this: men are what you make them, therefore be careful how and what you make. For instance, a young man, a near neighbor of mine, was much given to bad habits, especially that of intemperance. He belonged to a family of means and respectability, and when not actually intoxicated, was admitted into the best society in the neighborhood. Being naturally kind-hearted and agreeable, he was quite a favorite. He visited some friends in a distant town, and when he returned, he talked much of the pleasant society he met—said there was not an intemperate young man in the place, and gave as a reason for this much-to-be-wished-for state of affairs, "The girls there would not look at a fellow who would drink."

He had not strength to resist the temptation to drink in a place where the girls *would* look at him, and, in fact, pay as much attention to him as if he were all that a young man should be; and he continued to degenerate. Now I firmly believe if the girls with whom he associated had not tolerated such behavior, he would have been won to virtue and truth, and would now be an honored and useful member of society.

I know a young lady of good character and respectable family, who is fond of society, recreation, and a good time generally, (which, of course, is all right; I want all, and especially the young, to thoroughly enjoy life); but here is the trouble. She is receiving the attentions of a young man who is *fast* in the broadest sense of the word. He has plenty of money, fine horses and buggies, and she does love to ride, in short, delights in having a beau.

Girls, let me entreat you not to sacrifice principle for a little pleasure. You have an almost unbounded influence over your gentlemen friends, and you can do them an untold amount of good, both for time and eternity, if you will but make an effort in the right direction.

Cultivate a winning agreeableness of manner by all means. Be firm in your principles of right, and let them be known. Let the boys know you abhor profane and impure language, intemperance, any kind of dishonesty or bad behavior, and, may I add, the use of tobacco? Do this earnestly, prayerfully, and be assured it will result in good to your friends.

Remember, this life is but short, and we each have a work to do. Let us do it so well that it may be said of us, when the end cometh, "She hath done what she could." FAITH.

A FLORIDA LETTER.

DEAR MISS RIPLEY:—I have been for weeks trying to find time to pen a few lines for your department of the RURAL. I read the contributions of others with much pleasure, and would be glad to add my mite to the general entertainment, but what can I write about away off here in the pine woods of Florida living in a very primitive style, and entirely untrammelled by the fashions and follies of modern civilized life? Coming from a busy bustling northern town only three hours ride from Chicago, we feel almost out of the world, and unless something about life here would prove interesting, I fear you will not care for my letters. I used to think myself quite a housekeeper, and fully able to give many a useful hint to others with less experience, but here all my old methods are completely upset, and I have to learn new ways, and resort to many strange devices, and although we have only been here eighteen months we have been so fully occupied in making a new home and so fascinated with the study of nature in such entirely new forms and phases, that the old life seems like a dream long past and half forgotten and I do not feel competent to take part in any discussions or present any ideas whatever referring to social life. There is no society here only as northern people make it among themselves, and as we are scattered miles apart, of course we can only meet at long intervals. When we do meet all our time is taken up in discussing and trying to solve the many problems that are constantly arising to perplex us in our new life here. I think it would amuse northern ladies somewhat to be present at a gathering of women here, and listen to the topics we discuss. One thing is certain our time is too precious to spend any of it in gossip, or in discussing the fashions. We have to put up with many inconviences and learn to do without many things which we thought absolutely necessary to our happiness while we were at the North, but there are also many pleasures and comforts here which we could not have there and on the whole I would not exchange the new life for the old. Of course one good reason for it, is that I, as well as my husband came here sick; he suffering so much from catarrh that northern winters were killing him. The climate has nearly cured him, and I enjoy almost perfect health here. I find that almost anything seems possible to me when well, and I have set myself diligently to work to beautify our home as that is my especial department of the labor. What I am doing and how I am doing it I will try to tell the ladies of the RURAL from time to time, (that is, if Miss Ripley does not deposit this in the waste basket as I am somewhat inclined to fear she will.) L. B. S.

Starke, Bradford Co., Fla.

TALKS ABOUT MY JEWELS.—No. 5.

BY MARGUERITE.

LET the day be ever so full of vexations and little naughtinesses, one forgets them all when the small white-robed forms kneel at one's side for their evening prayers. Something, perhaps the protecting angel hovering near, bestows peace on the mother, while her great heart's love unites with the little ones in asking for blessings on her soul's jewels.

They are quieted, too, and add the petition, "God bless Papa and Mamma and everybody. Make Mamma well right away and fill all our hearts full of love to Jesus."

Papa carried them off to their room last night in the midst of their romp, while eyes were so bright and bodies so active, that sleep seemed to be hours distant.

But "Mamma couldn't stand it," and besides it was their bed-time. Anything but a quiet report was expected, for they seemed on mischief bent, and the foot-board of the bed is Fred's favorite jumping block. Papa returned saying, "The precious dears! I kissed them 'good night,' came out, closed the door, and listened. Gertie said, 'Well, Fred, let us kiss each other 'good night' and go to sleep,' so the report was a *smack*, and our four-year old Gertie was soon asleep, while Fred, who is past two, lay still, but wide awake, calling 'Papa' gleefully every time he heard his father in that part of the house.

Gertie said one morning at breakfast, "I asked Jesus to make my Mamma well, but I guess He did not hear me." God forbid that doubt should ever enter her heart, but may she early learn "Thy will, not mine be done," and also to wait patiently on the Lord.

She attends church but generally comes home without a crumb that I can find, although I trust seed is sown that may bear fruit in the future. One day she returned with her dark eyes radiant. The minister had dropped a precious crumb, and she was not slow in claiming it. She told me that "he said to be good to the children; to be good to the little boys and girls, and I said," she continued, "that if they would be good to me, that I would be good to them."

How quick a child is to return kindness for kindness, love for love, and is not infancy the surest time to teach them to love the Lord? Are we mothers always as good to the little ones as we ought to be? Is our love wisely given? Do not some of us stitch, stitch, over pretty dresses because we love to see them look well, while their little hearts ache for Mamma to amuse them? May God teach us how to let the sunlight into the windows of their souls, and at the same time take proper care of their bodies, for these are the souls' houses.

A CHAT ABOUT VARIOUS MATTERS.

I AM at the present time living in a secluded place, in a sort of gap in the coast range of mountains near the Pacific. We only get our mail once a week, so you see my chances for writing are few. I am afraid it will be out of my power to write anything instructive to your readers. I might interest them by telling something of life in Oregon—an as yet unwritten page; or a description of blackberrying in the Cascade mountains might not be without interest; but whether they will be suitable subjects for an agricultural paper, or more particularly for your department of it, is a question I cannot answer.

Coming to Oregon at an early day, I have experienced many of the trials and privations incident to pioneer life. In the first place, I am not a model housekeeper, and not having the modern conveniences for housekeeping—probably considered necessities in the Eastern States—I should expose myself to ridicule in saying anything on the subject. If, however, I could write you a series of friendly letters, you might find something worth gleaning.

I would say a word to girls about plain sewing. In these days of sewing machines there is a tendency to slight the finishing up of garments. How untidy to have the ends of thread hanging just as left by the machine, or to have a garment disfigured by a zig-zag hem. Do your work neatly, finish it up nicely, and the habit once formed will never be regretted. Anything that is worth doing at all is worth doing well. Never be ashamed to have the wrong side of your work examined. I once heard a lady, who was looking at a dress a careless girl had made, say, "If that is the way she makes her dresses, I don't want her to make my boys' shirts, they wouldn't stay together until they were half worn out."

If agreeable, I will write, some time, a plea for old ladies; also tell how I have managed to decorate my house, and give you an account of my famous rosebush. For the present, I will subscribe myself, yours truly. AUNT ESTHER.

Lane Co., Oregon.

[Aunt Esther is heartily welcome to our circle. We shall be very glad to learn of Oregon life and of Cascade mountain blackberrying; also to hear what this new aunt has to say of old ladies—this rather piques our curiosity, for it is usually the *young* ladies who are written about—of the "famous rosebush" and the particulars of that house decorating.—EDS.]

USEFUL NOTES.

MY DEAR MISS RIPLEY.—Do your lady-readers know how easy it is to keep fruit and butter fresh by evaporation? It is a thing well worth knowing, in times when ice is hard to come by, and when one has no cellar. I have kept butter hard and firm in the hottest weather, simply by putting the vessel containing it, into another holding water, and, pressing a linen cloth *closely* over the butter, letting the ends hang into the water. It is very important that the cloth touch the butter at all points, leaving no room for the entrance of air. The more loosely woven the linen, the better, and it is a decided advantage to place the things to be kept cool in a current of air, as evaporation is thus made more rapid. Berries can be kept nicely in the same way.

A very nice sauce for boiled beef can be made with horse-radish. I never knew how good boiled fresh beef was, till I ate it in Germany. There it is the standard dish, and after five hours of slow simmering over the fire, it is really delicious when eaten with either one of the following sauces:

Have ready a large cupful of grated horse-radish. Melt two large spoonsful of butter in a skillet, stirring into it enough flour to thicken it well. Add the horse-radish, and dilute to the proper consistency with the pot liquor.

The second sauce is made in precisely the same manner, except that two spoonsful of dry mustard are used in place of the horse-radish. This makes beautiful, golden-hued gravy, much more delicious than one would think before tasting it. Both these two sauces should be slightly thicker than drawn butter. L. S. H.

Ithaca, N. Y.

WHAT SHALL BE DONE WITH THE PAPERS?

DEAR MISS RIPLEY:—Can you or any of your readers tell me what to do with my papers? We take several papers in our family that contain too much good reading matter to destroy. From some of them I cut the choice selections, poetry, etc., and paste them in a scrap-book, but such papers as the RURAL, for instance contain too much that is valuable to cut, though I have cut the Domestic Economy department out of some of the RURALS to have the recipes more convenient for reference. For scrap-books I use old account books; cut out a portion of the leaves and paste scraps on the others, paste a strip of cambric on the back and cut the letters forming the words "Scrap Book" out of gilt paper and paste on it. Another question I wished to ask but don't know whether it belongs to this department or not. What kind of strainers do you use for milk? Some object that the strainers allow hairs to pass through.

Woodlands, S. C. MYRTILA.

A CONVENIENT APRON for washing days, is a large apron made of ticking or strong gingham, with a roomy pocket on the hip to fill with clothes pins, when the washing is ready for the line.

AUNT EM.

THE CENTURY for August 2nd. contains an article, How to be Beautiful, by Agnes J. Burke, in which some interesting and useful toilet hints are given.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

We were busy stemming strawberries with a view to bottling and preserving, and my girl visitors were not in the least afraid of staining their fingers. "Wash them immediately in cold water without soap, and the stains will disappear," said one, and so we took the hulls off the splendid berries and piled them on flat dishes with alternate layers of sugar that by this method was soaked and melted by the time they were all ready for the preserving kettle. I was moralizing a little. "Look at poor Mrs. Rosecleaf," I said; "married at twenty, without any knowledge of the work before her, and her life since, one series of difficulties. Now, there were the Donal girls that you have heard me speak of; they could do any kind of work in the kitchen or garden, and were refined and lady-like in the parlor—quite at home in both spheres." "I wonder," I mused, "what has become of those of the family now living. Of one I know

'Dear girl, the grasses on her grave
Have (many) years been growing.'"

There was a silence for awhile, when the sound of carriage wheels broke the stillness. I am not given to affectation, so washed my hands and went to the front door in time to receive the oldest Miss Donal who had been my bridesmaid and whom I had not seen for fifteen years.

"Yes, we are sixty miles from home, and have driven over to see you," she said; "it has been a long-talked-of visit, and this year I determined not to wait any longer but to come and see you for old times' sake."

How we looked at each other, and thought of the changes since last we met; talked of our children, and sympathized with each other in our mutual sorrows for the baby forms we had both tenderly returned to mother earth.

But one cannot live on sentiment, nor yet on sorrow, and in a little while I found my thoughts wandering to the important subject, "What shall we have for dinner?" I mentally reviewed the facts of the case. There was a small piece of lamb—chops could be improvised; then we had, of course, peas and other vegetables. "Dessert?" said the cook of the day, as we hurried to prepare the meal for our weary and doubtless hungry friends. I gave a look of supreme indifference at—just then, seeing the question seemed to disturb the routine of the preparations, I said, "Who wants a better dessert than strawberries?" And so it proved, for they were appreciated, I observed, as the best part of that hurried dinner. And while the fruit season lasts I would impress upon housekeepers the importance of putting up a good supply of canned fruit. It is cheaply done, and in many ways proves useful in winter. A dish of canned fruit instead of pie or pudding, in a hurry, like that I have mentioned, will save work and be wholesomer as dessert. It is perhaps not generally known that common salt bottles will keep fruit in a good state of preservation, if properly heated. The cork that is put around the neck of the bottle, effectually keeping out the air. I have used them for the last eight years, and found them quite satisfactory. In filling hot bottles, if they are set upon a wet cloth, they will not be at all likely to burst. All corks and lids must be made equally hot. So with a little care and labor we can have a supply of summer fruit all the year round.

HOUSEKEEPING IN SUMMER.

When the mercury is up among the nineties, and air and earth are full of insect-life, the cares of the housewife are greatly increased. At that season, all of the apartments of the dwelling, especially the pantry, store-closet and cellar need the closest scrutiny.

Those who build and occupy their own houses, are less likely to be troubled with house-bugs than those who move annually into rented houses. However, due caution on the part of the housekeeper is always essential, in order to keep her house free from insect pests.

Without doubt, insects are much more interesting to the entomologist than to the housewife.

The surest way to keep clear of ants, is to leave nothing around that they like. In extreme cases, an old table can be put in the cellar to keep provisions on—each foot of the table to rest in a saucer of water, so that the ants cannot cross it. The food that is kept on the table should be in covered dishes to keep out dust and flies, although there need be no trouble from the latter, if the cellar windows have screens. The class of ants called "workers" that are disposed to visit the sugar barrel, cake box, etc., etc., fortunately have no wings.

Flies can be kept almost entirely out of the house, if movable wire screens be fitted to every window and door. Mosquito netting will answer, but is not so good as wire, which keeps in place better, and is not so soon injured by storms. But keep these pests at a distance, by not allowing anything to be thrown about the yard to attract them.

The sow-bug often seen near potatoes in the cellar, can be banished by sprinkling salt over all the vegetables.

Cockroaches can be driven away, if green cucumber parings be put near their haunts.

Moths may be kept out of carpets by shaking them thoroughly at house-cleaning time, after which the frequent use of the broom with an occasional sprinkling of camphor gum or insect-powder, and plenty of sunlight will exterminate them.

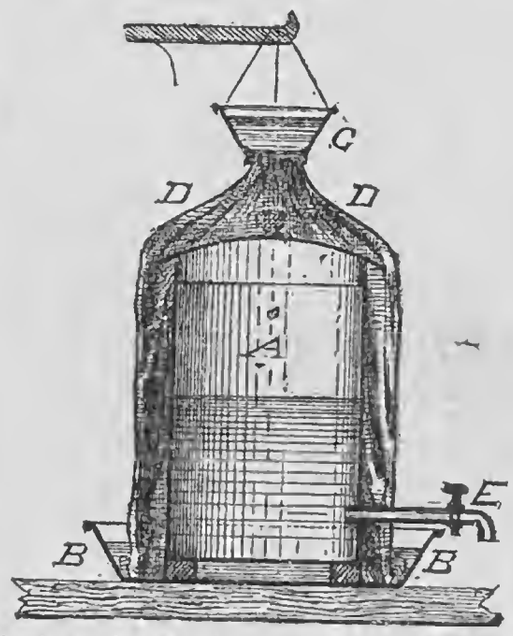
One of the annoyances of housekeeping in summer, is, that food, however carefully prepared, soon spoils. There is no economy in using food that is not perfectly fresh. Meats that have the least taint about them should not be made into hashes, and the evil disguised by high seasoning. Disease lurks in such food. Fresh meats are best kept in refrigerators with plenty of ice above them, while at meal times they should be covered with wire screens, that are made for the purpose.

Ice is a great preservative, and the woman who has a liberal supply of it, with a good refrigerator, will find that these articles lessen the perplexities of housekeeping in summer.

M. G. RAND.

A WATER COOLER WITHOUT ICE.

Cold water is not only a luxury but in many cases a necessity during the summer days, and yet multitudes of persons are unable to obtain ice to secure the desideratum. To such let me say it is not really necessary. This fact may be new to some persons yet the accompanying sketch shows a modification of a plan long in use in the East and in nearly all hot climates. It is based upon the fact that rapid evaporation of moisture from the outside of the containing vessel, keeps down the temperature therein.



A. shows the vessel containing the water or other articles to be kept cold. It sets upon wooden blocks in an ordinary pan B, shown in section. Suspended from a bracket or other convenient support, is a smaller dish C, in the bottom of which are punched a few small holes. Hanging from the under side of this dish is a woolen blanket D, completely enveloping the vessel A—it is cut away on the front side in the sketch. This is kept thoroughly wet by occasionally pouring cold water into the dish C, which trickles down the blanket and is caught in the large pan B. Water may be drawn out of A through the faucet E, as required without disturbing the apparatus. If it is preferred, butter, fruits, etc., may be placed in A, instead of water, and will be kept very nicely. The more rapid the evaporation of the water in the blanket, the cooler the contents of A will be kept.

Ontario Co., N. Y. WM. R. BROOKS.

HOUSEHOLD NOTES,

In picking sour fruit, if it is to stand in tin a few hours, put a sheet of brown paper in the pail. If obliged to cook in tin, empty immediately, when done, into a stone or earthen vessel. This summer, a family I knew were made very sick by eating of pie plant which had been left in the basin during the afternoon.

Let me give a word of caution to inexperienced housekeepers, and that is, *to keep things well covered.* Now is the time for cheese, vinegar, and green flies, to commit their depredations. They will lay their eggs in pickles, cooked potatoes, peas, beans or all vegetables, meat of any kind, mush, puddings, pies that have but one crust, dried fruits, when around the stove, in fact on almost everything. Pails without handles, jars, bowls or anything that can be covered *tight* are safest. Tie a cloth over or cover with a plate so as to make positively insect-proof and save waste. It's rather an unpleasant thought, but when I hear a woman say she never saw any flies' eggs, I think probably she has eaten a good many. Avoid this by taking good care of everything.

M. B. M'LOUTH.

DOMESTIC RECIPES.

Tomato Salad.

Take off the skins with a sharp knife, cut into thin slices and lay in a salad-bowl. Make a dressing by working a teaspoonful each of salt and made mustard, half a teaspoouful of pepper, the yolks of two hard-boiled eggs, with two tablespoonsful of melted butter; then whip in with a fork five tablespoonsful of good vinegar. Pour over the tomatoes and set on ice or where it is cool for an hour before serving. MRS. J. NEWTON.

Tomatoes and Corn.

Peel and cut into slices eight large tomatoes, cut and scrape the corn from half a dozen ears and mince one medium sized onion; mix together and stew half an hour. Season with butter, pepper and salt, and simmer 15 minutes longer. M. G. P.

Scalloped Tomatoes.

Peel and cut into slices one-fourth of an inch thick as many ripe tomatoes as you wish to fill your baking dish; put into the dish, first, a layer of tomatoes, seasoned with butter, pepper and salt, then a layer of bread crumbs, and so alternate until the dish is nearly full, having bread crumbs last; cover and bake half an hour, then remove the cover and bake brown. MRS. W.

Okra and Tomatoes.

Peel and slice eight good-sized tomatoes, cut into rings the same number of tender okra pods and chop fine two small green peppers; boil in a porcelain kettle—iron discolors the okra—for 20 or 25 minutes. Season with butter and salt.

Boiled Okra.

Boil the tender pods in salted water for 20 minutes, and serve with butter, pepper, salt and vinegar. G. W. B.

Lima Beans and Corn.

Boil a pint of shelled beans in water just to cover, for 10 or 15 minutes. Cut corn from half a dozen ears and add to the beans; boil 20 minutes or half an hour, adding hot water as needed to keep from burning. Season with pepper, salt and two tablespoonsful of butter.

Tough Steak.

Instead of pounding, cut it with a sharp knife, making fine parallel cuts on either side until every part has been crossed and recrossed. Press it together and lay on a wire broiler. Hold close to the fire until each side is seared to retain the juice, then turn and tend with the utmost care. Place the steak upon a hot platter and season with bits of butter, pepper and salt. MARY B.

Jelly Cake.

One cup of sugar; one-half cup of butter; three eggs; one teaspoonful of soda and two of cream-of-tartar; three tablespoonsful of sweet milk, and one cup of flour.

For Low Spirits.

Take one ounce of the seeds of resolution, mixed well with the oil of conscience, infuse it into a large spoonful of the salts of patience; distill very carefully a composing plant called "others' woes," which you will find in every part of the garden of life, growing under the broad leaves of disguise, add a small quantity and it will greatly assist the salts of patience in their operation. Gather a handful of the blossoms of hope, then sweeten them properly with the balm of prudence, and if you can get any of the seeds of true friendship, you will have the most valuable medicine that can be administered. Be careful to get the seeds of *true* friendship, as there is a seed very much like it called self-interest, which will spoil the whole composition. Make the ingredients into pills and take one night and morning, and the cure will be effected. MRS. L. GARDNER.

QUESTIONS ANSWERED.

Baked Indian Pudding.

Mrs. H. C. G., asks for a recipe for old-fashioned baked Indian-meal pudding.

Ans.—Take two quarts of sweet milk, scald and stir in one pint of Indian meal, a scant pint of molasses, a teaspoonful of salt and two tablespoonsful of butter. Season with ginger, if liked. Put into a *moderate* oven, and in half an hour stir up from the bottom and add a small teacupful of cold milk. Bake from two to three hours. Serve with liquid sauce. Should any of our readers know of a better recipe, we shall be pleased to publish it.

News of the Week.

MISCELLANEOUS.

Monday, August 11th, 1879.

The approaching election in California is exciting an unusual amount of interest in the Eastern States on account of the possible effect it may have on the next Presidential election, should that be thrown into the House of Representatives by the failure of the people to elect a President. For this purpose the successful candidate must have an absolute majority of all the votes cast, and if three or more candidates are in the field, this is often not easily obtained. Now there are four Congressmen to be elected in California, and the Republicans expect to elect the entire number. If they do, then the Democratic majority in the House will be reduced to one, and unless the Democrats decide the disputed election in the case of Goodlove S. Orth against him on a vote by States, as they are pretty certain to do, the State delegations which would have to elect a President, will stand 17 Republican to 18 Democratic, with Indiana a tie and the casting vote in the hand of the Greenbacker, De la Matyr. The Kentucky State election this day week resulted in the election of Dr. Blackburn, the Democratic candidate, as a matter of course, but it was by a majority about 40 per cent. smaller than that which elected McCreary four years ago. The Republicans have gained several members of the Legislature. Many bothersome inquiries were put to Blackburn as to whether he is the doctor of the same name who, during the war, tried to spread yellow fever in the Northern cities through the introduction of infected rags and clothing. From the fact that he did not deny the implied charge, it is generally supposed that he is the same man. His nomination for the governorship, however, is due to his heroic conduct at Memphis during last year's yellow fever epidemic there. A couple of months ago an account was given here of that Vicksburg Convention assembled to protest against the negro exodus, on the plea that all classes and all shades of political partisanship were now entirely safe and untrammeled in that State—the "Bloody Chasm" was closed up, the wolf and the lamb were reposing amicably together. Lately, however, a Col. Dixon, down in Yazoo county, and three other gentlemen announced themselves as candidates for various local offices, subject not to the ratification of the forthcoming Democratic Convention, but "only to the choice of the people at the ballot-box," it being well understood that "the people" included the "niggers." Of course, the regular Democratic organization regarded this as a piece of confounded impudence, and Dixon and his friends were "waited upon" by an armed mob of about 300 indignant bull-dozers who insisted that the "Independents" should quit the country or "take the consequences," "the consequences," of course, meaning death. Well, Dixon and the others listened to "reason," and effected a compromise by which they resigned their candidacy, and were kindly permitted to stay in the country with only the odium which such conduct as theirs deserves from a chivalrous community. It is now predicted that this may have a tendency to make the North a trifle more "solid," and that it will certainly revive the "exodus," at least in that part of the South. By the way, that "exodus" has terminated in nearly every place for the present. Altogether, the immigration to Kansas has not been greater than that which often arrives at this port within the space of two weeks—not more than four or five thousand, according to the highest estimate.

The invariable sign and forerunner of good times for the last 80 years has been the increased demand for public lands by settlers, and the 6,000,000 acres sold on homestead entries, according to official returns for the year ending June 30, form a larger area than has been sold in any year since Lincoln signed the Homestead Act. The average number of acres taken by homestead settlers in the last ten years has been 120, and at this rate the number of acres sold in the last year, indicates 50,000 homesteaders; or, supposing each homestead to be taken by the head of a family—which is generally the case—a population of over a quarter of a million must have settled on the public lands within the twelvemonth. This return is only for the lands of the United States, and does not include the lands sold on account of railroad grants, or the lands sold by some of the States which have special land grants within their own borders. In 1878 Texas sold 3,800,000 acres to actual settlers, and there is good reason to believe that the sales of that State for the year covered by the returns of the United States, amounted to 4,000,000 acres. The sales by the principal railroad companies in the year after the panic, amounted only to 400,000 acres, but in 1877 and 1878 they rose to 1,000,000 and 2,250,000 respectively; and partial reports make it probable that, in the year ending June 30, such sales reached at least 3,000,000 acres. From very fragmentary returns of land sales by various States, it is estimated that at least 500,000 acres were disposed of in this way. These estimates, all based on the very best attainable information, make the total amount of new land sold within the year, at least 13,500,000 acres, of which it is known three-fourths were sold to small holders; and it is probable that nine-tenths were. Under the Texas law and by the railroads, lands are sold in larger quantities than under the homestead act, so that no very accurate data exist for an estimate of the number of single purchasers. Probably, however, it is not less than 75,000, and as each of these freeholders will, as a rule, represent a family, together with male and sometimes female help, these sales represent a newly-settled population of at least 500,000. Grouping all the accessible returns of land sales for the previous year—that ending June 30, 1878—we find the following results:—government homestead entries 4,500,000 acres, Texas 3,500,000 acres, railroads 1,250,000 acres, from State grants 250 000 acres—the last three estimated—and the total sales amount to 9,500,000 acres. During the last 24 months, accordingly, the sales of land in the West have amounted to fully 23,000,000 acres. The total area of the farming lands in this country was placed by the census of 1870 at 400,000,000 acres, less than half of which was improved. The additions made to this area, judging from the land sales down to 1877, were not certainly over 20,000,000 acres, so that the increase in the last two years, and much the larger part of it in the last twelvemonth, has added 5 per cent. to the farming lands of the country.

Yellow Fever has at last been declared epidemic

at Memphis, where it is still spreading so steadily that there is little hope of its disappearance before frost, unless in the meanwhile all liable to it have been attacked. There has long been a dispute as to whether it is contagious or not, many asserting that for its propagation a peculiar atmospheric condition is necessary, and that in the absence of this the malady isn't "catching." Several cases have occurred this year, however, in parts of the country where such conditions have not existed, yet where the disease has been contracted either from sick refugees or infected articles. For example, last Friday a young man died of Yellow Fever in Brooklyn, who had "caught" it by visiting a vessel that had lately arrived from Havana, and had been permitted to leave quarantine before its cargo had been thoroughly disinfected. There are a few sporadic cases still in New Orleans, but with the exception of an occasional case at points at which the panic-stricken refugees rested, the remainder of the South is free from the scourge and is likely to so continue. During the week ending last Saturday there were in Memphis 134 new cases, 29 deaths from the plague, and only 13 deaths from all other causes.

During the week offices have been simultaneously opened in this city, London, Paris and several other money centers in France, for the receipt of subscriptions towards the construction of that canal across the Isthmus of Darien. Here there were only a few shares taken, and those only for small amounts, and almost entirely by Frenchmen. Cablegrams also announce that the project has met with a reception almost equally cool in London, while shares are selling in Paris at five per cent below par with only a few takers, so that Lesseps' sanguine expectations that the investment would be eagerly sought for, are likely to be disappointed. Our government is openly opposed to the route selected by this company, and to the entire undertaking on account of its being in the hands of foreigners. It is known that our coasting trade would be its chief source of revenue, that its management would concern us more than any other nation, and therefore it is thought that Americans should have control of it. Moreover, the Monroe doctrine forbids the interference of foreign nations in the affairs of this continent beyond the hold they had here when the "doctrine" was promulgated, and this project has such mighty consequences that in its present condition, it is looked upon as constituting such an interference. Our government's opposition is one cause of the partial failure hitherto of the subscription list. Another is a report published by the American engineers that attended the late Congress on the subject in Paris. This demonstrates the existence of almost unsurmountable difficulties along the present route, and numerous advantages possessed by that by way of Nicaragua, which has always been considered the American route.

FOREIGN.

There seems to be a good deal of uncertainty about the progress made in the negotiations between Berlin and the Vatican. One day's cablegrams announce a definite agreement satisfactory to all parties, except the unofficial extremists; next day's reports are apt to contradict this flatly, and to declare that nothing has yet been settled. This struggle between the Empire and the Papacy is an old one. Eight hundred years ago it raged fiercely between Henry IV., the German Emperor, and Gregory the VII., the celebrated Hildebrand, whose vigor in behalf of ecclesiastical purity and Papal supremacy afterwards won him a place among the canonized saints. On account of his crimes and assertion of paramount authority, the Emperor was deposed by the Pope, and after a bitter struggle against his nobles, who had rebelled on account of the Papal deposition, he was forced to make a pilgrimage to Italy to sue for pardon. The Pope had taken refuge in his castle of Canossa, and is said to have kept the suppliant Emperor three whole days in the court of the castle, clad in a single garment and shivering in the cold of January, before absolving him from excommunication. Henry returned to Germany, defeated his opponents, and regained the Imperial Crown; but ever afterwards he entertained the bitterest animosity against the Pontiff, whom he warred against until his death in exile. During the recent negotiations between Bismarck and Cardinal Nina, the expression has been common in the papers, that the Emperor would never go to Canossa, or that he had gone there, meaning that the Emperor would never submit to the Papacy or that he had already done so. The probability is that there will be a compromise, each party yielding some of its claims. It was through the Chancellor's negotiations with the Pope that he has been enabled to secure the support of the Catholic party in his recent conflict with the Liberals in the Reichstag, and by this means has succeeded in partially Prussianizing Germany, and in gaining a position for the Ministry semi-independent of the representatives of the people. Some say that he cannot, therefore, refuse an amicable arrangement with the Ultramontanes, while others declare that he has been too shrewd to definitely compromise himself, whatever impression he may have conveyed to the Catholics, and that having through their means secured what he wanted, he is likely now to "throw them over," as he has frequently treated other parties under similar circumstances.

The defeat of Cetewayo seems to have really put an end to the war in Zululand. He has fled to the northern regions of his territories accompanied by only a small body of his followers. His brother and most of his chiefs have already submitted to the victors. It is said that the British have set a price upon his head, though on what plea they can justify such a barbarity, it's hard to imagine. The fugitive king was never a British subject, and was perfectly justified in refusing to accede to the demands made upon him before the outbreak of hostilities and consequently in combatting to the best of his power, the invasion of his country. The only excuse that can be found for such a measure is in the old saying, "might makes right," or perhaps in some of our own past dealings with our aborigines. One of his brothers is said to be hunting him, having promised the English that he would capture him or "burst." It is said that as long as he lives, at liberty at least, discontent and petty warfare are sure to harrass the lately subjugated territory. Lord Chelmsford having brightened the close of a career of blundering and defeat by his late victory at Ulundi, has resigned his command in South Africa and is on his way to England. Lieut. Carey, who commanded the detachment which abandoned Prince Napoleon to the savages, has been courtmartialed, but the sentence has been quashed on account of a detected informality in the proceedings of the court. It is highly probable a second one will not be assembled, though the lieutenant's military career is, most likely, ruined. He comes of a fighting family, had an excellent reputation himself, and it would seem that the young Prince's own imprudent boldness was the main cause of his untimely end.

There is a report that very friendly messages have been sent by the Czar to the Pope and that a concordat satisfactory to the Vatican, will soon be agreed upon between the two. Probably the rulers of Holy Russia are willing to seek anywhere just now for assistance in suppressing the terrible tenets of Nihilism which, despite all efforts at suppression, seem to be rapidly spreading throughout the unwieldy empire. Thousands of the Nihilists have been banished to Siberia, many more have been executed, and the prisons are full of others, but still they multiply in every rank of society. Now, the Roman Church has always been a rigid stickler for authority, always preaching obedience to the Powers that be, always opposed to insubordination, on principle, and therefore likely to be treated with unaccustomed kindness by the czar at a moment like this, when the whole of his vast dominions is alive with the spirit of revolt and insurrection. Nor are Russia's troubles all internal for on the Southern frontier 40,000 Turcomans are in arms to resist her encroachments while on the Eastern border 400,000,000 Chinamen are said to be about to be arrayed against her to resist her persistent land-grabbing in that direction. The latest reports, however, from that quarter are of a somewhat more peaceable nature than their predecessors for the last couple of months.

The perfume of freshly-culled flowers is agreeable to every one, and so it is with the delightful fragrance of MURRAY & LANMAN'S FLORIDA WATER. None reject it, none dislike it. From the tropics to the frigid zone, it is the universal favorite on the handkerchief, at the toilet, and in the bath.

Nothing purifies and enriches the blood and destroys all poisons in the system like Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, August 9, 1879.

BEANS AND PEAS.—Trade is moderate in marrows with the novelty of being quoted lower than mediums. As a rule the bean market, generally, is quiet. Stock of red kidney deemed large with approach of new crop. Peas nominal. Beans, marrow, prime, $1.27½@1.30; fair to good, $1.20@1.25; medium prime, $1.30@1.32½; fair to good, $1.25@1.27½; choice, $1.30@1.35; fair to good, $1.20@1.25; red kidney, prime, $2.40@2.50; fair to good, $2.20@2.30; turtle-soup, $2.30. Peas, green, per bush., — @ —; Southern, b. e., 2 bush. bag, $2.75; Canadian, in bulk, in bond, per bush., 70c.

BEESWAX—Is offered at lower prices, quoted at 23@24c. for Western and Southern.

BROOM CORN.—Current receipts are easily placed at strong prices,

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@5c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Receipts are lighter, but there is no element of demand that favors values in consequence. Shippers took only 1,721 packages, and there is considerable stock that local consumers can make out with without competing for the scarce and high priced creameries and pails. The fine goods of State are firm, but only go in small lots at the extreme. English markets are looking better, but are not yet strong enough to call out prompt purchasers on the part of New York shippers. In fact, there is nothing in view that promises any improvement upon the ordinary quiet market of August, particularly as this year shows an unusual stored surplus. Western butter, dairy and factory, must be right in flavor and body to bring outside extremes.

State pails and half tubs, choice, 15@16c.; good to prime, 14@15c.; fair to good, 12@14c.; firkins, yellow, 14@16c.; Welsh, good to choice, 13@15c.; fair, 12@13c.; poor State, 8@9c.; State creamery, choice, 17½@18c.; good to prime, 16@17c.; fair to good, 15@16c.; sweet cream, 16@17c.; Western creamery, choice, 17½c.; other, 15@17c.; imitation, 10@13c.; Western dairy, best, 12@13c; fair to prime, 9@10c.; factory, choice, 10@11c.; other, 7@9c.; poor, 6@6½@6c.; grease butter, 4@5c.

COTTON.—There is a good full business, closing firm at for August, 11@11.01c.; September, 10.93@10.94c.; October, 10.24c.; November, 10.03@10.01c.; December, 10.01@10.02c.; January, 10.06@10.08c.; February, 10.06@10.19c; March, 10.30c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

CHEESE.—There has been a weak feeling all through the week. A larger portion of the receipts have shown some damage by the warm weather, and these parcels have been placed at 5c. down. Really fancy lots, however, have been available at 5¾@5¾c., with 5¾c. reached occasionally. The exports for the week reach 76,055 boxes.

Quotations for State factory: Fancy, 5¾c.; good to prime, 4@5c; fair to good, 3¾@4¾c.; half-skimmed, 3@4c.; skimmed, 2@3c.; State farm dairy: Fine, 5c; good to prime, 4¾@4¾c.; fair to good, 3¾@4¼c.; skimmed, 2@3c. Wisconsin factory: Fine, at 3@3½c.; good to prime, 4¼@5c. Ohio factory: Cheddar, fine, 4¼@5c.; do., fair to good, 4¼@4½c.; full cream, flat, fine, 5@5½c.; flat, good to prime, 4¾@4¾c.; flat, fair to good, 4@4¼c.; half-skimmed, 3@4c.; skimmed, 2@3c.

Liverpool quotation, 31s. 6d.

Steam to Liverpool, 40@45s.

DRIED FRUITS.—Apples sell well at strong prices; otherwise trade is slack.

Patent evaporated apples, choice, in cases, at 11c.; do. fair to good at 9@10c.; N. Y. State sliced, choice, at 4@5c.; do, quarters, choice, 4@4½c.; western quarters, bright, at 3½@4c.; common and old at 2@3c.; North Carolina peeled peaches at 9@10c.; do. Georgia, 8@9c.; do. fair to good at 6@7c.; unpeeled halves at 3@3½c.; do quarters at 2½@3c. Blackberries at 5c. Raspberries at 26@28c. New York State plums at 8@10c. New pitted cherries, wet, at 13½@14c.; dry at 15@15½c.

EGGS.—Receipts for week, 5,375 bbls.; do., last week, 6,100 do. Losses have run heavy, owing to the steady hot weather, and buyers want best guarantee when they make a wholesale deal. Near-by watering places are not using as many eggs as in former seasons, and the local trade gets a check when good straight lots are scarce. Near points, 14@15c.; State and Penn., 13@13½c.; Western fresh, 11@11½c.; Canadian, 11½@12c.; poor Western, 10c.

FLOUR.—Buyers have the advantage. The receipts are large and freely offered on the decline in wheat.

Latest prices are: $3.60@4.30 for inferior to very choice superfine State; $4.30@4.65 for poor to good extra do., odd lots and lines; $4.65@5 for good to very choice do.; $3.05@4.30 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $4.30@4.65 for inferior to very good shipping extra do., and $4.65@4.90 for very good to choice extra do.; common to choice white wheat extras, $4.35@5; choice to strictly fancy do, at $5.00@5.60; red and amber winter wheat, inferior to very choice trade and family, at $4.65@6.00; round hoop Ohio at $4.00@4.30, and trade and family brands of do, at $4.50@6.00, the latter rate for very choice; St. Louis, $5@5.85 for inferior to very good extra; $5.85@6.65 for very good to very choice (with fancy brands held higher); Minn. clear, very inferior to very fancy, at $4.35@5.00; do. "straight," very inferior to strictly fancy, at $5@6.50, and patent poor to very choice fancy at $5.25@7.50; unsound stock at from $2.25@2.80; city mill extra at $5.25@5.50, good to choice, for West Indies; do. for England, $4.35@4.75; do. trade and family extras, $5.75@6.75; do. for South America, $5.50@5.75 for standard to choice brands (winter wheat product); No. 2 at $2.50@3.35 for very inferior to very choice.

FRESH FRUITS.—Cheap peaches push many items aside, and nothing but very choice grades of miscellaneous fruit can be called steady. Over 150,000 baskets of peaches have arrived this week. Some fine samples of Southern Bartletts are here. Cal. Bartletts, $3.50@4 per case. No more to come. Cal. plums, $4 per case for Purple Duane and $5 for German prunes. This last variety of Eastern growth met with much favor last season.

Apples, red Astrachan, up-river, ₱ bbl., $2@2.50; do., Jersey, $1.50@2; Nyack Pippin, $2.50@3; Orange, do., $1.75@2.25; Sour Bough, $1.50@2.25; Sweet do., $1.25@2. Catherine pears, good to prime, per bbl., $1.75@2.25; Bloodgood, fair to prime, $2@2.50; Bell, fair to prime, $1.25 1.75; Bufium, $1.50@1.75; Bartlett, Southern, extra, per crate, $2@2.50; poor, $1@1.50; up-river, ₱ bbl., $4@6; N. J., $4@5.50; cooking, per bbl., $1@1.50. Peaches, Md. & Del., Early York, per crate, 70c.@$1; Troth's, 70@90c.; do., per basket, 50@75c.; Jersey, common, 25@50c. Hot-house grapes, 2@3c. for B. Hamburg and 30@40c. for sweet waters. Ives, N. C., per 54 lb. case, $3.50@4.45; do., in baskets, per lb., 4@6c. Plums, up-river, Egg, per bbl., $4.50; Md. and Del., blue, per bushel, $1.25@1.50. Whortleberries, Md. & Del., fair to good, per qt., 3@5c.; Jersey, do., per 14 qt. box, 50@75c.; do. mountain, 75c.@$1. Blackberries, Monmouth Co., Wilson, per qt., 4@5c. Watermelons, Jersey Black Spanish, ₱ 00, $10@20; Nonticoke, prime, $15@20; Norfolk, do., $ 0@12; N. C., $8@10; culls, $4@6. Nutmeg melons, Cantaloupe, Monmouth Co., ₱ bbl., $2@2.50; do., S. Jersey, $1.25@1.50; do., Jenny Lind, 75c.@1.25. There is an active city and out-of-town demand for peanuts: receipts are light and stock in store is reducing. Prices have advanced and rule strong, with the tendency still in sellers' favor. Hand-picked nuts are about out of market and entirely nominal. Va. hand-picked, $1.47½@1.55; fancy, $1.35; extra prime, $1.30; good to prime, $1.20@1.27½; shelled, per lb., 5¾@6c.

GRAIN.—Wheat has been pressed for sale and is much lower, leading to a good export trade. Sales of No. 1 amber at $1.08½@1.08¾; No 2 amber at $1.07¾@1.08 do., August option, at $1.07¾@1.07¾; do., September option, at $1.07¾@1.07¾; ungraded amber at $1@1.08; No. 1 white at $1.10¾@1.11¾; do., August option, at $1.10¾@1.11; do., September option, at $1.10¾; No. 2 white at $1.08¾@1.09; ungraded white at $1.02@1.10½; No. 1 red at $1.08¾@1.09; No. 2 red at $1.08@1.08½; do., August option, at $1.08@1.08¾; do., September option, at $1.08¾@1.08¾; do., October option, at $1.08¾; No. 3 red at $1.03¾; ungraded red at 90c.@$1.08; No. 2 Chicago spring, September delivery, at $1; No. 2 Northwestern spring at $1; rejected spring at 75c.; ungraded spring at 78@91c.; New York No. 2 spring, August option, at $1; No. 3 spring at 83@90c., chiefly at 90c. Rye at 67@68c. for Western. Corn is active and closed at firm prices; Sales of New York No. 2 at 45¾@46¾c.; do. August at 46c.; do. September at 46¾@47c.; do. October at 47¾@48c.; New York steamer mixed, car lots, at 44¾c.; do. August at 45c. bid and 46c. asked; do. September, at 46c. bid and 47c. asked; ungraded Western mixed at 45@46½c.; No. 2 white at 53@54c., and yellow Southern at 47½@48c. Oats are doing better, with trade active; sales of New York No. 1 white at 41c.; New York No. 2 white at 37½@38c; New York No. 3 white at 35@35½c.; No. 1 at 34½@35c.; No. 2 at 34@34½c.; No. 3 at 33c.; rejected at 31c.; mixed Western at 33½@35c.; white do. at 36½@40c.; white State at 40@41c.; mixed State at 34@34½c.; No. 2 Chicago at 33@33½c. afloat.

HAY AND STRAW.—There are freer supplies, but demand is good and prices sustained.

New hay is at 45@50c. for shipping; 70@80c. for prime, and 55@60c. for medium. Old hay at 50c. for shipping and 70@85c. for prime retail qualities; medium at 50@65c. Straw at 45@55c. for long rye, 45c. for short rye, and oat at 30@35c.

HOPS.—Our market remains firm and prices strong. Fine qualities are taken up immediately on arrival at full prices. There is a noticeable increase of the common grades. Buyers prefer a good 1877, for which they will pay more money. Several bales of the 1879 crop were received on the 7th and 8th; they are of fine quality, and are offered at 40c., with no sales at time of going to press. Receipts, 1,774 bales; exports, 479 bales.

	Bales.
Receipts for the week	1,774
Total receipts since September 1, 1878	87,360
Total receipts for same period in 1877	136,874
Export clearances for the week	479
Total exports since September 1, 1878	32,210
Total exports for same period in 1877	78,949

Quotations are for New York's, new crop, prime choice, 15@18; New York's, new crop, medium, 10@12; New York's, new crop, low to fair, 7@9; Eastern, 8@12; Western, 8@11; Yearlings, 4@10; Olds, all growths, 3@5; Pacific coast, nominal, 10@16.

A. J. Luce & Co., of this city, received on Thursday the first bale of new hops. It came from Montgomery Co., Ga, and was rated choice.

OIL-CAKE.—Western is quoted $28 per ton.

POULTRY AND GAME.—Early supplies of live fowls in the week sold low; with smaller receipts prices are better, but still below last report. The trade will not stand a rush of coops. Chickens lower. Geese have advanced.

Chickens, large per ₱., 14@15c.; small, 11@13c., fowls, N. J., 10@11½c.; Western, 10@11c.; Southern, 10c.; roosters, old, 6@7c.; ducks, ₱ pair, 10@10c.; geese, best, $1.10@1.62; others, $1.12@1.37.

Turkeys, ₱ lb., 13@15c. Dressed is in moderate demand; choice turkeys something higher; other stock easy: Phila., dry-picked, 16c., State and Western, 14@16c.; chickens, Philadelphia, per ₱., 15@18c.; State, 13@15c.; Western, 12@14c.; fowls, choice, ₱ ₱., 13@14c.; other, 10@12c.; dry-picked, 14@15c.; ducks, spring, dry-picked, 12@16c.; other, 11@13c.

Game scarce; the few items firm. State woodcock, 75@80c. ₱ pair; Western, 65@75c.; Eng. snipe, ₱ doz., $2.

PROVISIONS—Have suffered a sharp decline on the unloading of one or two prominent speculative holders; mess pork quoted for August, $8.55@8.60; September, $8.55@8.60; October, $8.60@8.65; November at $8.65@8.75 for seller's option, old or new. Bacon at 4¾c. for long clear and 5¼c. for short clear. Lard at $5.75 for spot; $5.70@5.72½ for September; $5.72½@5.75 for October., Stearine at 6¾c. Tallow at 5 13-16c. Beef hams at $18.

VEGETABLES.—Exports potatoes, 2,450 bbls. Potatoes low, but prime quality keeps them moving; fair to good L. I. and N. J., $1@1.25; extra, $1.50; culls, 50c.; sweet yellow, $3.75@4; red, $2.50@3. Slow-well's evergreen corn gives good commercial satisfaction. Cabbages firmer with improved size. Green corn, extra large, per 100, 75c.@$1; do., poor, 25@50c.; cucumbers, L. I., 30@50c.; do., pickles, ₱ M, $1.50@1.75; tomatoes, L. I., near-by, ₱ crate, 50@62c.; string beans, ₱ bag, $1; Lima beans, $1@1.50; squash, L. I., yellow, ₱ bbl., 50c.; do., do., white, 50c.; do., marrow, 75c.; green peas, L. I., ₱ bag, $1@1.75; cabbages, flat Dutch, per 100, $3@5; onions, white, per bbl., $2.25@2.50; red, $2; yellow, $2@2.25; beets, N. J., per 100 bchs, $1@1.25; Russia turnips, per bbl., 75c.@$1; carrots, $1@1.25; egg plant, Phila., $75c.@$1; do., L. I. and near-by, per 100, $3; okra, Jersey, per 100, 15c.; peppers, bullnose, per bbl., $1@1.50.

TOBACCO.—Export demand very slow and trade otherwise moderate, with prices steady.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to All.

Reading for the Young.

A SONG FOR THE LITTLE ONES.

I NOTICED in the RURAL, some months ago, a request for "Old Time Songs," which brought to my mind a simple ditty taught me when I was a very little girl. I do not know where it came from, who was the author, or whether it has ever been published; but I send it to the wee ones, hoping that it will afford some of them as much amusement as it did me in my childish days.

ALICE P. ADAMS.

THE HUNGRY FARMER.

There was a hungry farmer
A driving out to grass,
And because he wouldn't go faster
He beat his poor old —animal with longitudinal auriculars.

CHORUS.

The rye dum diddle,
The rye dum day,
The rye dum diddle,
The rye! dum! day!

He went a little further,
And he met a pretty miss,
He put his arm around her
And stole a little—apple out of her basket.
The rye dum, etc.

The maiden beat the donkey
With a little hickory switch,
Which made him throw his master
Into a neighboring—excavation filled with impure liquidity.
The rye dum, etc.

And then he saw a squirrel
That he wanted for his dinner,
But he didn't know how to catch him.
He was such a little—wicked, depraved individual.
The rye dum, etc.

The squirrel climbed a gum tree
Till he got up to the top,
And he couldn't go any farther,
And so he had to—turn round and go back again.
The rye dum, etc.

And now my song is ended,
We'll pass around the hat,
And hope you'll take this chance
To laugh and to grow—dignified, and aldermanic in your proportions.
The rye dum, etc.

"THE TALKING WINDMILL."

IT is gone now; I do not believe a single splinter of it remains, not even the posts that supported it, and the place where it stood is overgrown with tall grass and weeds; but I know it stood out there once. "The talking windmill." Yes, it is a queer name, but I choose to call it so, for long ago —oh! years and years ago, when I was a little school girl—it used to stand or hang out there between the two unpainted posts, and in the cold nights, when the wind blew fiercely across the fields, sending a storm of fine snow before it and making the old trees fairly shriek, and rattling the doors and windows, I would listen to it. One such night all of a sudden the old windmill began a loud protest against all this needless bustle and rage. How it did gesticulate! how its arms did beat and whirl! while in its unearthly voice it plead with the wild night. "Cease, O, cease! Cease, O, cease!" it would cry for an hour at a time; then, as if in great anger at the unrelenting blast, it would change its beseeching tone, and cry out angrily, "Well, then, rage! well, then, rage! Rage and blow! rage and blow!" Then again, as if speaking to itself, it would keep on repeating in a low tone, "I'm a'cold, I'm a'cold; I am old, I am old; Winter King, O, Winter King, I will sing, sing, sing." And so it would scold, and fret, and grieve away all winter long. Often in the bitter midnights I would waken suddenly, only to hear the poor thing entreating and beseeching, and raving and fretting.

After a time, when the usual number of months had elapsed, spring came on, and then it seemed to grow more content. Sometimes it would rest all day; on rare occasions, all night, but not often, for it was the nature of the thing to go around in its own limited circle. It was a very busy windmill, and believed in making music while the wind blew. Then when the summer days came again, and the grass fringed the roadside and crept over the meadows, and the young dandelions looked gladly up to the blue skies, and the birds came singing back to our homes, and the young lambs were basking in the mellow sunshine, and everything said in its sweetest voice, "It is summer, it is summer," then some queer thought seized the poor windmill, and it cried out, in its strange, squeaking voice, for some one who did not return with the summer. Over and over again it repeated its gloomy cry, "Charley Cook, Charley Cook, C-h-a-r-l-e-y C-o-o-k," and so it would go on, drawling out the name to a great length; then, in a sudden passion of grief, repeating it over and over, "Ch'ly Cook, Ch'ly Cook," as fast as it was possible for it to speak, and again blending the words with "Darling, dear, Charley dear." Then, after a pause, I would hear it sighing out, "Gone away, gone away, gone to-day, to-day, to-day," and for hours it would not cease, but go on with its wild lamenting. I never knew who the bewailed Charley was, but suppose the wind must have borne all sorts of strange tidings to my restless friend, for it always seemed to be affected by the wind, and ever after, until I looked for it and it was not, it ceased not to mourn for lost Charley.

Well, it was a long time ago, and the windmill belongs to the past; but sometimes I seem to hear some of the old dirge, sung plaintively in the summer nights when the wind is among the trees, and sometimes I catch the wild, beseeching tones when the winter storm is abroad, so I fancy it is the voice of the wind spirits talking together of their lost friend. I look out at the spot where it once stood; how we children used to play out there! how the flowers grew and blossomed in the flowerbeds just this side and right in the shadow of the windmill! But they are gone now, all gone; and the windmill is gone, and the children are gone, too. Ah, me! If to-day they were out there, they would not run and frolic, but walk with quiet footsteps, and speak with the voices of men and women.

MRS. CHARLOTTE E. FISHER.

What the Club Does.

DEAR UNCLE MARK:—I want to tell you that I am glad you originated the idea of a Horticultural Club for the children, for I believe it will do more good towards stimulating a love of horticulture among the youths of our land than anything else could, and than you ever dreamed of. My children have always been farmers (as much as children could be), but since they have joined the club, they are more enthusiastic and are finding more new beauties in their plants and flowers than ever before, and they are particularly proud of those which Uncle Mark sent them the seeds of. I have always tried to cultivate a love for horticultural pursuits in my children by allowing each one to have a little "truck patch" all their own, and permitting them to do what they pleased with whatever they raised on it. * * * * *

Rosa and Letha have shown their gardens to some of their little friends, also their plants that are growing from the seed that Uncle Mark sent, and some of them say they are going to try to get their parents to take the RURAL, so they can join the club, too.

L. J. A.

Clermont Co., O.

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE MARK:—We have received the White Tailed radish and Dolly Dutton corn, for which we heartily thank you. They came some time ago, but it was too dry to plant them, and still remains so; perhaps we shall have to wait till October 1 before they are planted. Even that late they will make a crop here. The ground is ready and manured heavily, but the manure is dry as a bone. We are going to harrow it in to-morrow. I have been experimenting with some pop-corn. I manured the ground well and planted two stalks of common field corn with it in each hill to see what would be the result. It was planted late, about the 15th of March, and is injured some by the drought. I want to keep up the experiment, and see if it will not all be pop-corn in two or three years. I gathered 16 ears from two stalks, which is better than papa will do with his Blunt corn. He says he would like to make a compromise about that premium. He will take 50 cents on the dollar, or even less, and say no more about it. Who of the cousins wants to pet another skunk? I can spare a hundred. Don't all speak at once.

Your nephew, JAMES Z. HERRON.

Burleson Co., Texas.

DEAR UNCLE MARK AND COUSINS:—We promised to give you a description of our home by the sea side; it will not require much space and but few words. We live in a humble cottage of concrete, and when our father came here the water was fifty feet from the dwelling, but now it tosses to and fro within twenty feet of the door. It might surprise some of our cousins to know that the cedars are growing luxuriantly in the salt water. We planted them at the water's edge to prevent the earth from washing away, and thus far it has proved a great benefit. We have visited five States, but found none to compete with this in climate. The winters are warm and the summers are cool compared with those seasons in the Middle States. Even now while others are complaining of the heat we can always find a cool place.

Our family ever formed a happy household until the 13th of June last, when in the silence of the night our eldest brother was suddenly called from us. He had been thrown from a horse, and survived the accident only a couple of hours. He was young, being only 25½ years old. The stroke has cast a gloom over our happy household, and carried sorrow to the hearts of many relatives and friends.

We planted the seed that was sent to my father by the RURAL, but, owing to the drought, we had no success with any except the Pearl Millet. We hope to see some more from cousin Empsie and cousin Ivy, for their letters were very interesting. We close with love to all from the

Copano, Tex. TWO SISTERS.

DEAR UNCLE MARK:—I have received the corn and radish seeds you sent me. I planted the radishes June 16th, and they were up in four days. I kept the ground moist and loose, and thirty days from the time of planting they were large enough to eat. I shall raise some seed if the season is long enough. July 9th I prepared the ground for the sweet corn by manuring, digging and raking it fine. I then planted the corn in a single row sixteen feet long, one grain in each hill two inches deep, the hills one foot apart. The corn was also up in four days. To-day (July 23th) it is nine inches high. Many thanks for these seeds. The radishes are just delicious. On the 5th of June I planted my beans, and now they are a beautiful sight. The rows are two feet apart and the beans in bunches of three or four, about eight inches apart in the rows. The beans now cover the ground, and look like one big plant. I have this year a clump of Tiger Lilies, and there are thirty flowers open to-day. In the spring I planted some flax for my canary bird, but the grasshoppers have completely destroyed it. How would some of the Eastern cousins like to have a swarm of grasshoppers land in their gardens? Yours truly,

Dodge Co., Neb. WM. J. MASON.

DEAR UNCLE MARK AND RURAL COUSINS:—Many thanks for the radish seed and sweet corn which you sent me. My corn is up and doing nicely. I had some of the radishes for breakfast this morning for the first time. They were the best we ever ate; papa and mamma thought so, too. I shall be sure to save some of both for seed. Our flowers are not doing very well, because it is so dry here. I think Bob White is a lucky boy to live where it rains every day, even if the weeds do grow fast; it is easier to pull the weeds than to carry water. Will you please tell me what scent the enclosed geranium leaf is? Mamma thinks it is lemon, but others say it is not, but don't know what it is.

Yours truly, BERTHA ROBBINS.

Lacona.

[The leaf is that of a sweet-scented Geranium, but there are hundreds of varieties of this plant which differ so little from one another that it is hazardous to name them without the flower, and even with the flower I might not be able to name it.—U. M.]

DEAR UNCLE MARK:—I would like to have a little place in your circle. I have read for a long time the letters from the cousins, and would very much like to become one of them. I do not exactly understand about your Horticultural Club, but I am very fond of flowers. I have a good many nice house plants. I have five different varieties of Fuchsias, several of which are covered with blossoms. I also have an Oleander, but it does not blossom. I should like very much to know how I can make it blossom—would Uncle Mark be kind enough to give me information? I don't think much of any kind of pets, but I just dote on horses. I see but few letters from Michigan, so I hope you will print this, for I would like to have my State represented. GUSTA.

Michigan.

[If Gusta desires to join the Horticultural Club, she must send her full name and address. The Oleander should be cut back now, to two or three buds on each branch. During the winter, from September to March, the plant should have but very little water and be kept in a room where it will not get much warmth and yet be safe from the frost. In March give the plant fresh soil and a larger pot. The soil should be a mixture of rich garden loam and leaf mold in equal parts, mixed with some well-rotted manure and a little sand. Then water freely when it begins to grow, give it a place in a warm and sunny window, and if there are any flowers in it they will be sure to come out and show themselves. After flowering the plant should be kept dry for a few weeks, then cut back and treated as before. The leaves should at all times be kept free from scales and dirt.—UNCLE MARK.]

DEAR UNCLE MARK:—I have for a long time desired to join your club, but have been afraid that my age would be an obstacle, as I am past 20, but seeing that Uncle True is a member, I take courage to beg for admission.

Permit me to thank you for the splendid seed premium. Defiance wheat, Blunt's corn and Acme tomatoes are doing finely. I have also good luck with the flower seeds.

Crops have suffered some from drought but we are to-day having a fine rain. Truly yours,

Trempealeau Co., Wis. J. O. EMION.

DEAR UNCLE MARK:—I thought I would write and ask you to accept me as a member of your Horticultural Club. I think it is very kind of you to start such a society for the benefit of the RURAL cousins. I am very much interested in the boys' and girls' letters. This is my first attempt; I will therefore write a short letter, otherwise I fear it will find its way to the waste-basket. I have quite a patch of potatoes; perhaps I will tell you this fall how many bushels I raised. Your nephew,

Bessemer's Depot, N. Y. ROVING DICK.

DEAR UNCLE MARK:—I am a little boy only seven years old but I can do lots of work; I have a garden that I care for myself.

I would so much like to join your Horticultural Club, if you will please put my name down.

FREDDIE STACKPOLE.

[You are welcome, Freddie, but I would like to know in what part of the United States you live. —UNCLE MARK.]

CHATTER.—One of America's young sons, a few days since, boasted of his bravery in staying out of doors during a thunder storm. "I like to hear it thunder," he remarked to his mother, and then ran out doors. Soon came one of those terrible, crashing explosions of the heavens, and in rushed Bobby to his mother. "What made you come in, I thought you liked to hear it thunder?" said his mother. "Well, I do when it thunders good, but when God lets it right down like this, it's kind of scary," was the reply.

Sabbath Reading.

SUNDAY AFTERNOON ($3.00 a year; Springfield Mass.,) for August is a hot-weather number, the articles being mostly brief and the stories numerous. Their titles and authors are:—Ruth, Ellen W. Olney; Through a Glass Darkly, Lizzie W. Champney; The Brass Andirons, M. E. Bennett; The People's Prayer, David Ker; and two chapters of Calvin. Rev. G. M. Boynton sketches a real character in the Gentleman Hostler, and Alfred Terry Bacon gives a pen portrait of Leadville.

The Phenomena of Inspiration leads to the conclusion that the truly great men of all times are as really inspired as were the prophets of old. The Hebrow Faith in Immortality is a reply to Our Debt to Socrates in the March number. The Problem of Intemperance claims that inebriates need physiological quite as much as moral and social treatment, and that the too abundant meat diet of Americans promotes intemperance. Prof. Borden P. Bowne writes on The "As If" of Atheism. There are also The Election of College Studies, Some Opinions About Opinion, and contributions by Rose Terry Cooke, Susan Coolidge, and Mrs. Edward Ashley Walker.

The poems are many and seasonable. Elaine and Dora Goodale and their mother, Mrs. D. H. R. Goodale, have each one. Another young poet, Kate St. Clair Greenleaf of Kentucky, has a little poem of which the Poet Whittier expressed this opinion:—"It seems to me to have much sweetness and rhythmical beauty." Other verses are by Frank Foxcroft, C. F. Richardson, Lucy Larcom, S. W. Duffield, and Alice M. Eddy.

The Editor's Table has these articles:—Rebels and Reprobates, The Colleges and Public Morals, Studying Scripture by Samples.

The name of the magazine will be changed with an early issue.

ANCIENT AND MODERN IDEAS OF INSPIRATION.—The Ancients set God and the universe in opposition. They often ascribed the creation of the world to a being less perfect than God. They were unable by a higher synthesis to reconcile their conceptions of Deity with the evil and imperfection which they beheld in themselves and in the world around. Polytheism had made Deity an intimate and familiar presence, that too often shared human frailty and vice. It was the reaction of Semitic Monotheism to send God away almost into the region of the unknowable. It enthroned Him in far-off and inapproachable majesty and holiness. So jealous were the Semites of the idea of God's unapproachableness and unsearchableness that, though in the warmth of religious utterance He was said to have appeared, to have revealed Himself by some name or otherwise, returning to philosophic accuracy, they would speak of such manifestation as that of some emanating power or lower God, and would sooner lay themselves open to the charge of believing in all sorts of lesser divinities as mediatory powers than in the least to appear to make Supreme Deity capable of any representation whatsoever. Has He appeared, or uttered His voice, or named Himself Jehovah? And would men hence presume to begin to predicate anything concerning His nature or mode of existence? He withdraws indescribable and unnamable into His absoluteness.

While God thus dwelt apart, alone in the possession of all that is good, this gross world, its thoughts, works and imaginations were only evil continually. It was totally depraved. It had no self-restorative power. It had no innate ability to will or think anything that is good. Even what might appear as good works were not so in reality, but had without doubt the nature of sin. How then were goodness and truth to appear and shine on the earth? It could only be by an interposition of the far-off God; by lowering the celestial sphere to inspire or "breathe" its holiness into the earthly. This was effected by the communication of an angel or by the gift of a *daimon*. In these messengers God was efficaciously and infallibly present. This mechanical junction of the celestial sphere with the terrestrial was denominated inspiration. The conception of inspiration that inevitably followed was this: They who received these divine messages, i. e., *inspired persons, were universally regarded as pure mediums.* Undoubtedly. There was and could be no *human* element in the message. The whole was direct from heaven. The inspired were *possessed.* "The word that the Lord hath put in my mouth, that I must speak." That this logical inference was commonly made we take Philo out of a multitude as witness: "A prophet says nothing of his own, but everything which he says is strange and prompted by some one else. . . . He is a *sounding instrument of God's voice,* being struck and moved to sound in an invisible manner by him." Again: "When the divine light shines the human light sets . . . and this very frequently happens to the race of prophets; for the mind that is in us is *removed from its place* at the arrival of the divine spirit, but is again *restored* when that spirit departs."

Since then, ancient philosophy made the inspired person a pure medium, "a sounding instrument of God's voice," every inspired utterance must be infallible. On this dark background of essential enmity and separation between God and nature much of past theology has been outlined. Some of it has been steeped in this utter gloom. This ancient falsehood of man's total depravity and hostility to God yet hangs its sable pall over the theology of some. But our view of nature and of God's government thereof is now radically changed. We believe nature to be sacred and God immanent and transcendent therein, its hypostasis and conscious soul. Religion we no longer look upon as a wave come from some etherial and mystic sea to flood our godless valley with its healing waters. As we have concluded men to be, not children of the devil and of darkness by nature, but the sons of their divine Creator, we find religion to be a fact deeply rooted in their moral consciousness. The highest manifestation of the hiding God that can possibly be vouchsafed to us, must after all but be divinely *human.* But if so, if the sublimest revelation of God to man must be a revelation of Him in and through man, then the germs of great truth and high capacity already reside in him by nature. A righteous life, then, is the result of *drawing out,* by all manner of education, the God-planted possibilities within him. But how was it attained, according to the ancient mechanical view? It was by first *driving out* and exorcising his old depraved nature and *bringing in* another in its stead. When a religious philosophy teaches that, in order to regenerate a race of helplessly lost beings, something must be literally *sent* from a literally *distant* God, it is evident that their regeneration must be by *opus operatum* and Calvinistic predestination; their inspiration must be infallible, since it communicates nothing but what is from above.—*Sunday Afternoon.*

THE BIBLE.—The Bible is the bravest of books. Coming from God, and conscious of nothing but God's truth, it awaits the progress of knowledge with calm security. It watches the antiquary ransacking among classic ruins, and rejoices in every medal he discovers, and every inscription he deciphers; for from that rusty coin or corroded marble it expects nothing but confirmations of its own veracity—*James Hamilton D. D.*

PERSONAL ITEMS.

Sir Henry Bessemer has in his time taken out 160 patents.

The Prince of Wales and other members of the royal family will visit the Melbourne Exhibition. The Duke of Genoa will go out in a man-of-war.

Miss Martha A. Head, the bride at a recent wedding in Wayne county, Georgia, is only 10 years of age. Her parents were at the ceremony and gave their full approval.

Wong Wing, a converted Chinaman, who was elected treasurer of a Chinese Methodist Church in California, has behaved "Allee samee like Mellican man," and absconded with the funds—$600.

The venerable Hanson Penn told a camp meeting congregation at Linwood, Md., how glad he was that, at the age of 70, he had just become a convert to Christianity. In the midst of his address he fell dead.

General Joseph Johnston, since his return to his home in Virginia, says that one year's experience in the House of Representatives has thoroughly disgusted him with politics, and that when his term expires he intends to retire to private life.

It is said that Charles Reade, the novelist, keeps two secretaries at work reading and clipping murders, poisonings, accidents, robberies and other "unco' mournful tales," which furnish him with the hint or substance for his stories and plays.

A French physician, Dr. Companys, who had charge of the sanitary arrangements of the Suez Canal works, has been sent to Panama to study the subject of health regulations for laborers on the proposed canal. Dr. Lesseps will get the men from South America.

Congressman Ewing's home, at Lancaster, Ohio, is a plain brick mansion, pleasantly situated on high ground. The General's eldest son, William, who is 23 years old, is principal of an academy in an adjoining township. The General has four other children, two boys and two girls.

The wife of Thomas H. Benner of Hagerstown had been warned before she married him that his temper was violent, and that, sooner or later, he would whip her. She seems to have made up her mind what to do if he struck her, for when he did so, she drew a revolver from her pocket and shot him dead.

Mitchell Jefferson of Scottsville, Va., found the coffee in his cup very bitter, and turned it back into the pot. Soon afterward his mother-in-law poured some coffee from the pot, drank it, and died. Mrs. Jefferson then confessed that her mother had induced her to attempt to kill her husband by putting poison in his cup.

Three sons of the Siamese twins, Chang and Eng are now living in Sumner county, Kansas. They recently appeared at the United States Land Office, in Wichita, in a contest in which one of them was a defendant and the other was a witness. They are spoken of as intelligent, wide-awake citizens, and fully up to the spirit of the times.

Attention has just been drawn in England to Miss Dick of Ventmoor, who has voluntarily stayed abed for twenty years. She was prevented by her parents from marrying the man she loved, whereupon she went to bed, declaring that she would never get up again, and has kept her word. She is now said to have been the original Miss Havisham in Dickens's "Great Expectations."

When Longfellow visited Queen Victoria at Windsor Castle, the servants crowded on the stairways and in the lobbies to get a view of him. On the Queen asking them, next day, why this compliment was paid to the poet, she was told that they used to listen to Prince Albert reading "Evangeline" to his children, and knowing the lines nearly by heart, they longed to see the man who wrote them. The Queen is fond of telling this story.

Mrs. Western is a most uncommon religious convert. After announcing her change of heart in a Baptist meeting, at Worth, Ga., she began to exhort with great volubility, and has kept it up ever since, stopping hardly enough to eat and sleep. The superstitious neighbor's regard her as an inspired speaker. She will pay no attention to anybody, but talks right on from morning until night. Thousands of persons have been to see and hear her.

The Rev. Henry J. Munson, when arraigned in a Worcester court for examination on a criminal charge, desired to preface his testimony with prayer, and had got as far as "Our Father who art," when the Justice stopped him. The clerical prisoner retorted: "I can pray in my mind, and may you, Judge, be called to answer to God for this refusal in the great day." He was committed for trial, but refused to walk to jail, and was conveyed in a cart.

Tip McLaughlin was convicted of murder, in Sacramento, several years ago. Immediately after the jury had rendered a verdict, and before he had been taken into custody by a sheriff, having previously been at large on bail, he coolly walked out of the court room and escaped to South America. There he was employed by Harry Meiggs, and subsequently made a great deal of money in speculations of his own. News has just been received of his suicide. He grew tired, he said, of being a fugitive murderer.

Charles Albert Fechter, the well-known actor, died at his home, near Quakertown, Pa., on Monday night, August 2, at 10 o'clock. He was born in London in 1824, his father being German and his mother French. He began his career as actor at the age of 17, and gained a very high reputation both on the French and English stages. After considerable money losses of late years in the management of theatres, about four years ago he purchased a 57-acre farm at the above place. His success as a farmer, however, was much less brilliant than his triumphs as an actor.

No health with inactive liver and urinary organs without Hop Bitters.

State you saw this in the Rural New-Yorker.

Kewanee Automatic, Solid Wheel, Wind Mill. Warranted superior in Elegance, Durability and Power, to all other wind motors yet made. Perfectly self-protecting and simple in construction, all parts subject to strain are wrought iron, Journal boxes of Brass with brass oilcups, all parts interchangeable with others of same size. First Premiums wherever exhibited,—43 in all. "We find it just as effective and more economical than the Steam Pump which we discarded for your Wind Mill."
AMOS CLARK, JR., President N. J. State Agr. Soc'y

THE FARMER'S FAVORITE
WINE & CIDER MILL.
IT HAS NO EQUAL IN SIMPLICITY,
GRINDS FOUR DIFFERENT GRADES OF PULP.
We make three sizes.
No. 1, Family Mill.—Two curbs, holding about 5 pecks each.
No. 2, Family Mill Press—has capacity of 1 barrel.
No. 3, New Power Mill.—Two men will grind 35 to 40 bushels hard apples per hour. By power will grind a bushel a minute. Its press has a capacity of 75 gallons at a pressing. Send for circular.
HIGGANUM MFG. CORPORATION,
Higganum, Ct.
Manufacturers of Agricultural Implements of all descriptions.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them. Manufactured by ZINC COLLAR PAD CO.,
BUCHANAN, MICH.

BIRDSALL ENGINE.

Possesses More Points of Excellence than Any Other now Offered.
IT CERTAINLY STANDS UNRIVALED IN EFFECTIVE POWER, AND THE SAVING OF FUEL AND WATER.
Its saving qualities are super-excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times, much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves jobs, saves money, saves reputation, and preserves the good will of all. Trial given in all cases before requiring payment.

FROM DARWIN.

THE EVOLUTION OF AN ARTIST FROM A PAINT POT AND A BRUSH.

Wit and Humor.

BADGERING WITNESSES.

THE court and jury, as well as the spectators, generally enjoy the scene when a lawyer, in an attempt to badger or browbeat a witness, comes off second best in the encounter. A correspondent recalls an amusing incident of this sort, which happened a few years ago in an Albany court-room.

The plaintiff, who was a lady, was called to testify. She got on very well, and made a favorable impression on the jury under the guidance of her counsel, Hon. Lyman Tremain, until the opposing counsel, Hon. Henry Smith, subjected her to a sharp cross-examination. This so confused her that she became faint, and fell to the floor in a swoon.

Of course this excited general sympathy in the audience, and Mr. Smith saw that his case looked badly.

An expedient suggested itself by which to make the swooning appear like a piece of stage trickery, and thus destroy sympathy for her. The lady's face in swooning had turned purple-red, and this fact suggested the new line of attack. The next witness was a middle-aged lady. The counsel asked.

"Did you see the plaintiff faint a short time ago?"

"Yes, sir."

"People turn pale when they faint, don't they?"

A great sensation in the court, and an evident confusion of witness. But in a moment she answered, "No, not always."

"Did you ever hear of a case of fainting where the party did not turn pale?"

"Yes, sir."

"When?"

"About a year ago."

"Where was it?"

"In this city."

"Who was it?"

By this time the excitement was so intense that everybody listened anxiously for the reply. It came promptly, with a twinkle in the witness's eye, and a quiver on her lip, as if from suppressed humor.—

"'Twas a negro, sir."

Peal after peal of laughter shook the court-room in which the venerable judge joined. Mr. Smith lost his case, not to say his temper.

THE DRESSMAKER'S LOVER.

ONLY this one dear boon I ask,
That you will give me your a dress,
That in your smiles I yet may basque,
And gain new life at each caress.

The blushes mantle on your cheeks,
Deny me not, it's dread foulard,
I've pressed my suit for days and weeks,
And sent you letters by the yard.

Oft at your feet I've knelt and braid,
But you have cut me short and square;
It lace with you—but I'm a frayed
You will not make up to me fair.

It's sashy pale has grown my face,
Though all things look most navy blue;
I'll collar mine, or I will face
Whatever evils may ecru.

[*Detroit Free Press.*

A LOVER will often take a whole year to press his suit, when any smart tailor will do it for him in less than an hour.—*N. Y. News.*

SAYS an exchange, "The mosquito, like the rest of the nabobs, will soon make his hum by the sea." But the main point is, he'll make some other person hum and howl in a way that would make Dennis Kearney's mouth water.—*Oil City Derrick.*

A GRAND avenue man sent up some bananas the other day, and his new cook, just from the country, boiled them with the cabbage and beets. She said he wanted a boiled dinner, and she supposed that was what he sent up the vegetable bolognas for.—*Peck's Sun.*

A GREAT deal of poetry has been written about "snow white sails on a shimmering, sunlit sea," but the sails on most of the craft that we have observed look as if they had been used for circus canvas in a very wet and muddy season. There's no whiteness about them.—*New Haven Register.*

DOWN in Georgia, says the Louisville Courier-Journal, they are all in favor of removing the tax on quinine and putting it on dogs. In other words, they want to take from quinine and put on canine. Or, to add another idea, they would take the tax off Peruvian bark and put it on dog's bark.—*Lowell Courier.*

QUININE IS FREE.

THERE'S a sound on the breeze—
A pæan of glee,
From the distant Maine trees
To the swamps of Maumee.

And the cheer gathers force
From the plains of Jersee
And the Hoosiers all hoarse,
Echo, "Quinine is free!"

"Avast fever and chill,
Off ague with thee,
We've shaken our fill,"
They're yelling in glee.

In Egypt, Ill'nois,
And by the Maumee,
They're hooping like boys,
"Huzza! quinine is free!!"

[*Cleveland Voice.*

THE average San Francisco gamin is 'cute. Standing before a fruit stand the other day, one of them said, "Hello, old fellow! how much for your oranges?" "Twenty cents a dozen, sonny." "Do you throw the thirteenth into the bargain?" "Yes, my lad." "Well, give me the thirteenth to-day, and I will buy the dozen of you to-morrow."—*San Francisco Golden Era.*

OUR inventor is at work getting out 44,000,000 of fancy cards bearing the words, "You can just bet your sweet life it is." They are intended to be worn on the lappel of the coats of all men in the United States in answer to the query, "Is it warm enough for you?" They will meet a long-felt want, and ought to have a tremendous sale.—*Wheeling Sunday Leader.*

ONE little letter will sometimes cause more trouble and worriment to a sensitive man than an immense volume. For instance, the item was written, "Mr. Smith, the clothier; has a fine stock of double-breasted uniforms, decorated with brass buttons; parties wishing to purchase, please call and examine." When the item appeared in the paper the word "uniforms" was "unicorns" and, as a consequence, Mr. Smith's store was filled with curiosity seekers and showmen. But gracious! wasn't he mad! And when he struck the editor square on the nose with his fist didn't he have a unique horn.—*New Haven Register.*

"I SAY, George, what makes you look so cheerful?" said one friend to another, recently. "Why, didn't you hear, Bob, I'm going to be married next Wednesday?" "Well, I must confess I see nothing in that to make you cheerful; I should think it would make you feel sad." "Why, no, my dear fellow; it will be the happiest day of my life. You see, Matilda is a very expensive luxury. She wants to go to the opera every night; it's cream on the way, a pound of candy while there, and soda water on the way home—and I tell you it's a terrible drain on a fellow's pocket, so I'm going to put a stop to it. Come in and have a cigar."—*Yonkers Statesman.*

A FEMALE representative of Erin, with a market basket on her arm, paused at the counter of an egg merchant, and after prieing some of his stock, asked if they were good. "They're nothing else," answered the man blandly. Then she rolled out a dozen or two of them, took up one, broke it and threw it away, then another and another. "What do you mean?" exclaimed the astonished dealer, arresting her in the act of smashing the last egg. "Mane!" she said, "didn't yez tell me they were good? Bad luck to ye then, how should I know it unless I be after thryin' thim?"

HE was inclined to be facetious. "What quantities of dried grasses you keep here, Miss Stebbins! Nice room for a donkey to get into!" "Make yourself at home," she responded, with sweet gravity.

THERE are two little girls of the same name in New London, Conn. The other night one of them said her prayers, and for fear they might be credited to the other child, she added, after the Amen, "No. 10 Orange street."

IN reply to a person who asked him the derivation of the word "restaurant," Bayard Taylor replied, jokingly, with a merry twinkle in his eye, "'Restaurant' is derived from res, 'a thing,' and taurus, 'a bull'—a bully thing."

THE clergyman in a certain town, as the custom is, having published the bans of matrimony between two persons, was followed by the clerk's reading the hymn beginning with these words: "Deluded souls, that dream of heaven!"

"WHAT is your name?" asked a teacher of a boy. "My name's Jule," was the reply; whereupon the teacher impressively said: "You should have said, 'Julius, sir.'" And now, my lad," turning to another boy, "what is your name?" "Billous, sir."

AT seven o'clock in the morning two duellists, who are to fight to the death at a place in the suburbs, meet at the ticket office of the railroad station. "Gimme a return ticket as usual," says the first duellist to the clerk, in a terrible tone and with a ferocious twist of his moustache. "I—I say, do you always buy return tickets?" stammers his opponent. "Always." "Then I apologize."

GOOD stories are always born twins. We all remember the quaint saying of Rufus Choate, who, when told that if he pursued his hard work he would ruin his constitution, replied that the constitution was gone long since and that for years he had been living on the by-laws. Of Sheridan the counterpart is told. He was somewhat given to indulgence in strong drink. When remonstrated with and warned that the quantity of brandy he drank would certainly destroy the coat of his stomach, he quietly poured out another glass and replied, "Well, then, my dear friend, there is nothing for my stomach to do but to digest in its waistcoat."

Languor, Its Cause and Remedy.

The cause of languor, when it is not the immediate or indirect consequence of positive disease, is traceable to a debilitating temperature. Persons living in a warm, moist climate are peculiarly subject to it. Diminished physical vigor and an indisposition to active exertion are its characteristics. Sometimes it is accompanied by undue relaxation of the bowels, and by dyspeptic or bilious symptoms. A reliable remedy is Hostetter's Stomach Bitters, a strengthening and alterative medicine derived from the purest and most efficacious vegetable sources, with a pure and spirituous basis, pronounced by eminent physicians a mild and wholesome stimulant. The Bitters, foremost of American tonics, is largely used in the tropics, where the climate is very productive of debility, malarial fevers, and disorders of the bowels, liver and digestive organs.

BIG GIANT CORN MILL.

Every Man His Own Miller.

The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.

Grinds twice as fast as any other Mill of same size and price. Manufactured by

J. A. FIELD, SON & CO.
922 N. 2d St., St. Louis.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y.

MAPES'
COMPLETE MANURES
FOR EACH CROP.

MAPES' COMPLETE MANURE ("A BRAND") for Wheat, Rye, etc. Fine and dry, adapted for drilling; packed in bags (200 lbs. each). Price $40 per ton on car or boat.

MAPES' COMPLETE MANURES for heavy and for light soils—substitutes for stable manure.

Send for pamphlets, describing **Mapes' Manures, Superphosphate, Ground Bone, Peruvian Guano, Chemicals, etc.**

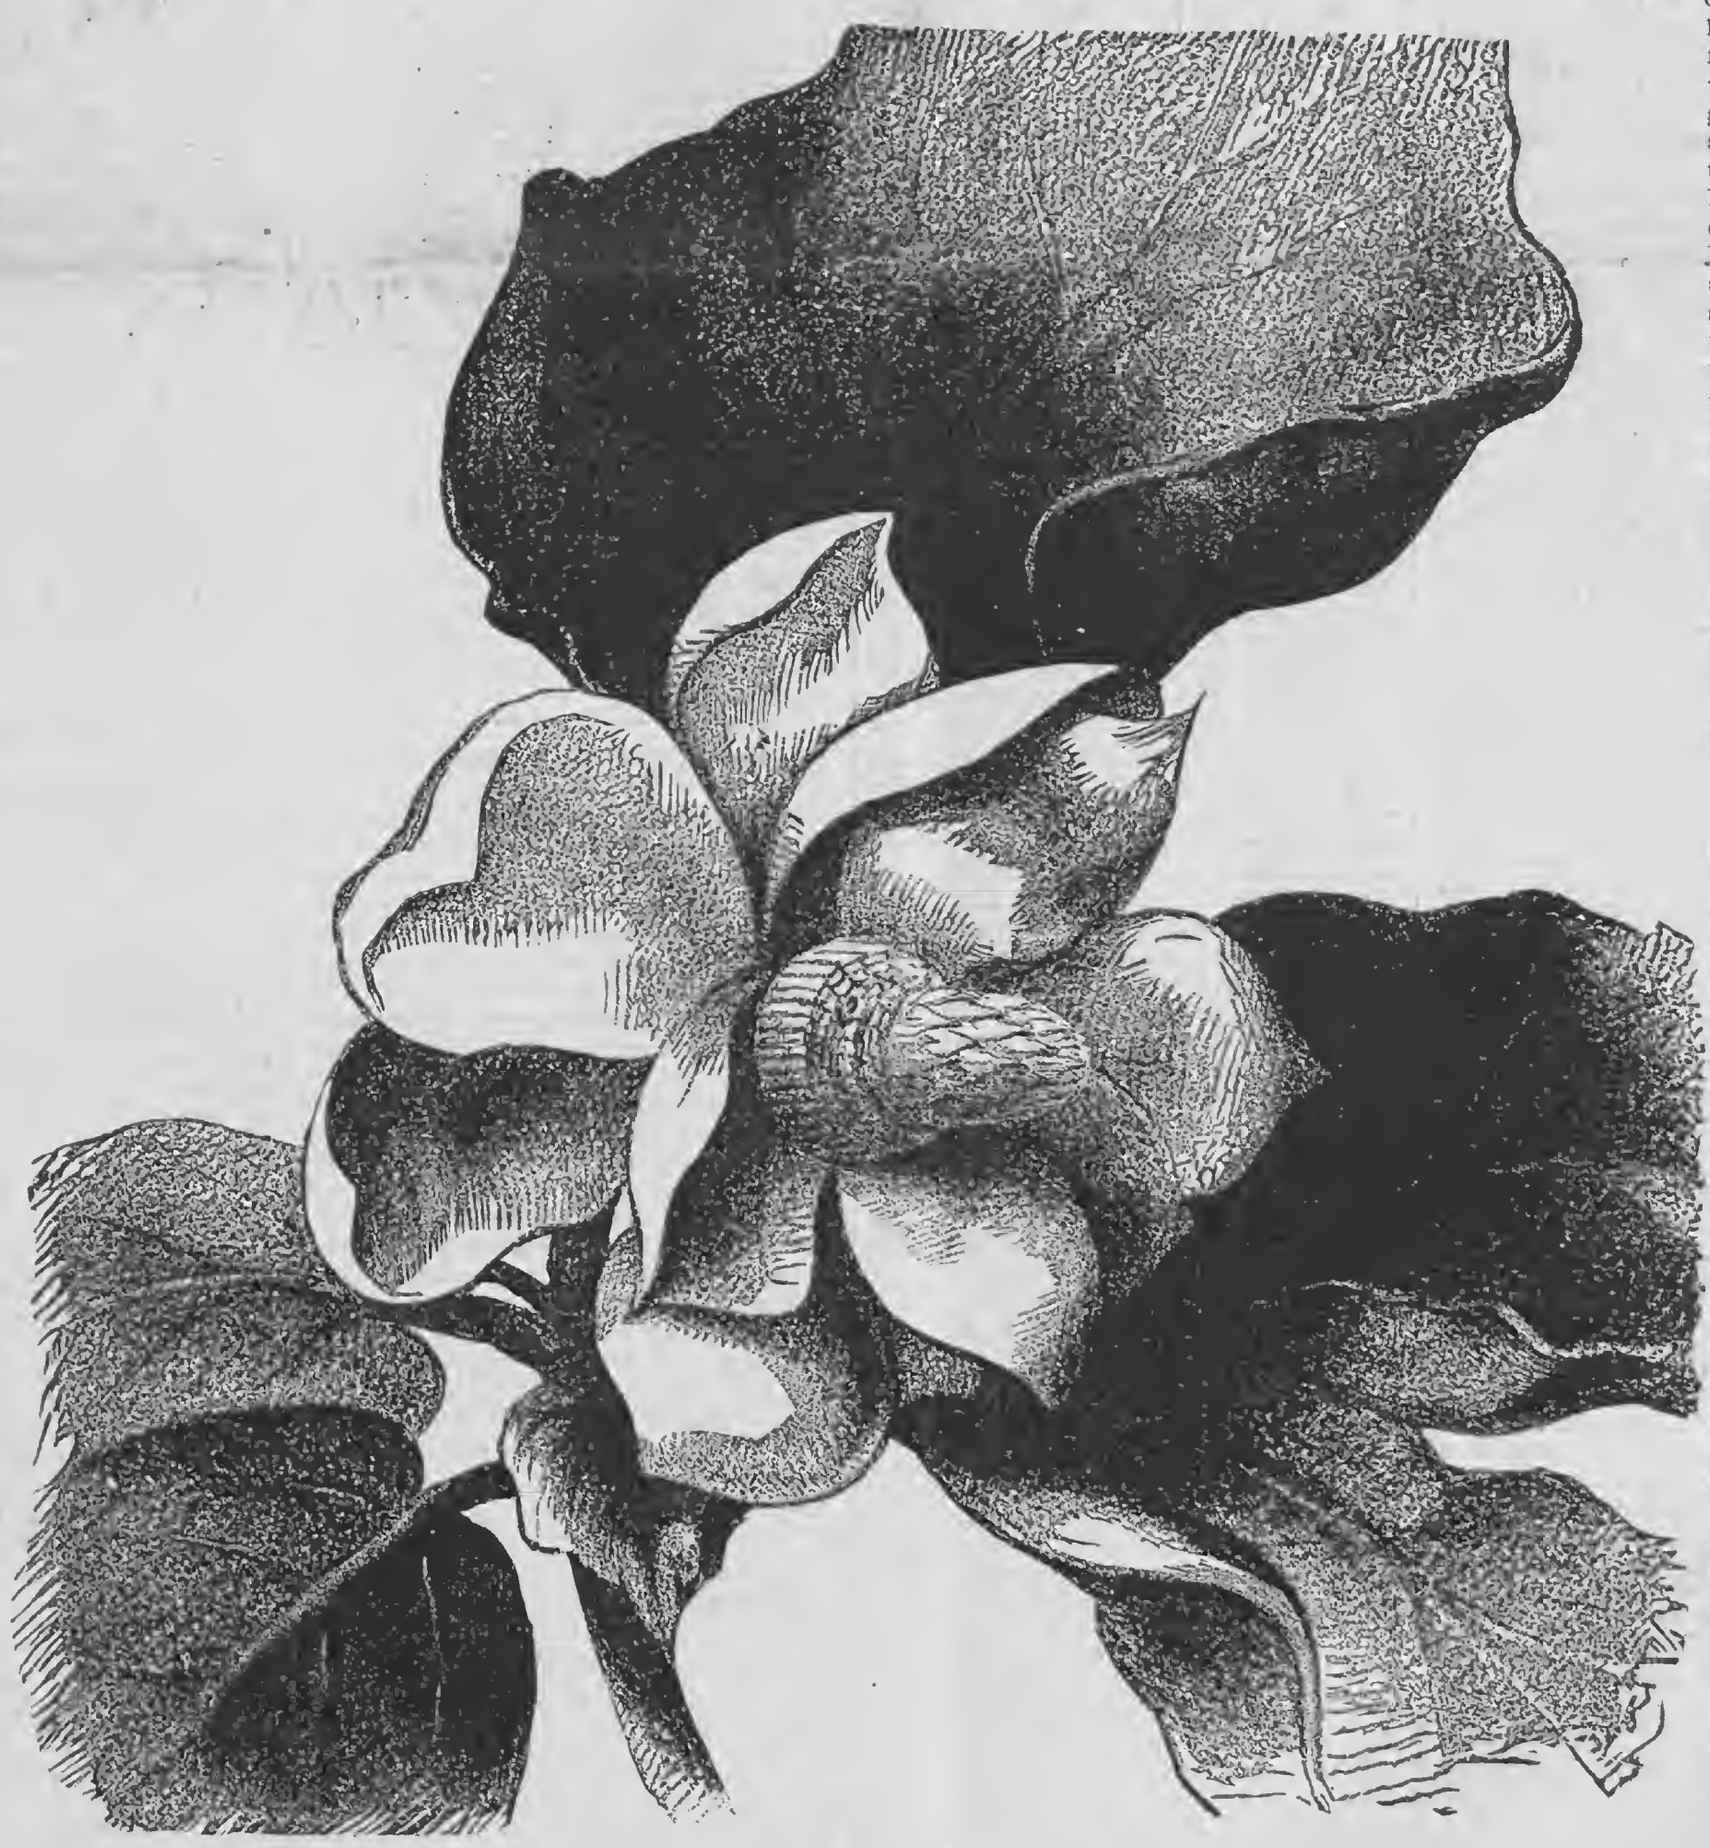
MAGNOLIA PARVIFLORA.

A NEW Magnolia must necessarily be a valuable acquisition when we think of all the estimable qualities possessed by the various members of this family or genus. Possibly the noblest and most effective in the leaf and flower among plants noteworthy in spring, the Magnolia has been, as it were, specially appropriated to that season. So much has this been the case that we are apt to think of Magnolias as blooming almost too early to escape late frosts, or to combine the adornment of both foliage and flowers. Of course, a moment's thought recalls the fact that only Chinese Magnolias, so called—Conspicua, Soulangeana, &c.—bloom very early, before the leaves appear and also that there are beautiful Magnolias blooming late in June. It must be confessed, however, that the beauty of the flowers of late-blooming species fails to equal that of Conspicua and Soulangeana, and that in most cases such magnolia flowers are more curious than attractive. For this and other intrinsic reasons, we feel confident that in the late-blooming Magnolia here illustrated — Magnolia parviflora—the reader will recognize a plant of evident merit.

Though certainly long known to a few botanists and explorers, such as Siebold, Maximowicz, etc., this is apparently the first time it is figured and presented for the actual employment of the general public of lawn planters. But what is this Magnolia to whose merits we wish to call attention? With little difficulty we might conceive it a nobler and better form of Magnolia glauca, one of our most charming native Magnolias. The flora of Japan, indeed, offers types very similar to our own, and in this case the similarity has been sufficient to induce Siebold and Zuccarini to call the plant in question a variety of Magnolia glauca, and Maximowiez speaks of it as resembling glauca more than anything else. But do not fancy that it bears a very close likeness to M. glauca, for the flower and foliage are all constructed on a larger and more effective scale. The leaves are often more than a foot long, oval, of a bright green on the upper surface and whitish on the under, after the manner of Magnolias generally. Otherwise the form of the leaf is somewhat unique, bearing no special resemblance to that of any Magnolia. The flowers are borne but sparsely, and because they are found only here and there on the bush the name Parviflora may have been given. Certainly the flower is not small, fully equaling that of Magnolia tripetala. The petals are arranged in a cup-shaped form, like those of M. glauca; are about four inches long and of a pure, solid, creamy-white color, like those of M. conspicua. Inside, however, the appearance of Parviflora is still more remarkable, on account of the extraordinary development of the pistils and stamens. These parts of the flower are peculiar in most Magnolias, but in M. parviflora they attain an unusual size and brilliancy of hue. The pistils, in a solid cone, rise out of a bed of stamens six or seven rows deep. The base of these is a broad belt of crimson, and the anthers are of the same color. In fact, the whole general tone of both pistils and stamens is more or less brightly crimson. But the most remarkable qualities of M. parviflora are its delightful spicy odor and the peculiarity of blooming in mid June. So penetrating and agreeable is this odor that the first plant which bloomed in this country, April 12, 1879, in the greenhouses of Parsons & Sons Co., distinctly scented the entire building, 100 feet long. Its fragrance is much more penetrating than that of M. hypoleuca, and in many ways Magnolia parviflora differs greatly from M. hypoleuca. In short, the vigor of the growth of parviflora, the lateness of its period of blooming, and its delightful, penetrating, spicy odor must eventually secure it a high place among hardy plants. To Mr. Thomas Hogg we are again indebted for the introduction of a valuable, hardy, Japanese plant. The first plant received in this country was, as far as appears, received from Japan in February, 1875. It has not yet been offered for sale, but it is being propagated as fast as possible.



MAGNOLIA PARVIFLORA.

Horticultural.

THE STRAWBERRY.

THE strawberry in our day has advanced from a *luxury* to be regarded almost as a *necessity*. What meal in June is complete without it! Now we have a wonderful assortment of this delicious fruit, from the white and light scarlet to the almost black. In flavor too, we have from the sharp acid to those that are sweet and rich. We have also, the "Lazy Man's Strawberry" and those which require something besides laziness to produce a fair crop. We are approaching the time when every family may and will have, the Strawberry.

What Strawberry shall they have? Every well appointed garden should have at least half a dozen varieties giving a succession. To one who has good loamy soil made sufficiently fertile and who likes to handle garden tools as well as to eat, I say plant the Duncan, Duchesse, Durand's Beauty, Forest Rose, President Lincoln and Glendale and if the President should chance to dine with you in June, you may furnish first-class strawberries for him in variety. It is not that I mean that these are the only good strawberries—Oh, no!—but I do mean that when well raised, these are good enough. Some one asks, "Why omit the Sharpless, Chas. Downing, Seth Boyden, Jucunda, Kentucky, Monarch, Crescent, etc, etc?" Well, these are possessed of sterling qualities and not to be despised. So we might make up several groups of the "cream of the Strawberry" and get *cream* every time.

The Great American has been condemned as a very unprofitable sort. It certainly is not the "Lazy Man's berry;" but I have grown it so large and fine as to cause exclamations, and I find that on a heavy rich soil, with good care, it is wonderfully productive. The Jucunda, too, is a little particular where it grows, but fit it exactly and it will fit an epicure. Now I suggest a few points in strawberry culture. For gardens, first select a list of varieties that will bear high culture. Second, give them all they will bear in fertility and culture, keeping them in single hills the rows being two feet by 18 inches. Remember

when you exhibit your two-ounce berries all you need do is to append your name—the berries will tell their own story. P. M. AUGUR.
Otsego Co. N. Y.

RAISING SUNFLOWERS FOR HENS.

THE necessity for a variety of feed for chickens is generally understood, but very few people are aware of the value of sunflowers as hen feed. They are very productive of oil, are eaten greedily, and give a peculiar luster to the feathers. I have one-eighth of an acre planted to this crop, and propose to bind them into bundles, and stow them away in a dry place for winter use. The heads can be thrown into the hen house, where the chickens will soon pick out the seeds, thus giving them exercise as well as variety. With plenty of other grain within reach, they will eat no more sunflower seeds than are beneficial to them. The seed can be bought at our seed stores at one dollar per bushel, at which price it ought to be more generally used than it is. I think a plot of sunflowers, with their great yellow faces turned to the sun, an agreeable sight.

Black Currants.

One must add line upon line, and precept upon precept, in agricultural matters as well as in spiritual and moral affairs, so I may be excused for repeating what I have before written in favor of Black Currants. Having just sold my crop—19 bushels—of this fruit, it may be well to add that it is one of the most satisfactory and profitable crops grown upon my place. So far, no worms or insects have attacked it; the birds do not eat the fruit, the chickens leave it alone, and even thievish boys do not steal it. It is the only crop that thus escapes all damage from depredators, always yields heavily, and sells well. For pies, puddings, jelly, and preserves, it is second to no other fruit. For all throat diseases, black currant jelly is a valuable remedy, while a little mixed with cold water makes a most delicious and refreshing drink.

HAVANA TOBACCO CULTURE IN THE CONNECTICUT VALLEY.

E. R. BILLINGS.

Tobacco Culture in the United States.

The culture of tropical tobacco took its rise in this country in West Florida, where it was planted by the Spaniards soon after they made a settlement there. Previously they began its culture in St. Domingo, and afterwards in Cuba, and the industry has continued in these two islands until now. Tobacco has been cultivated in Florida ever since the Spaniards first planted it, and it is now quite an important production in one or two counties of the State, Perique, an old Spanish navigator, in 1820 settled in St. James Parish, Louisiana, and at once began the culture of that variety of tobacco which now bears his name. At first he used seed from Virginia, later from Kentucky, and finally from Cuba; but at length abandoned the use of Havana seed for the single reason that the plants were of inferior size, and consequently a less profitable variety to cultivate. Properly speaking, the tobacco cultivated in those States is tropical or semi-tropical, being finer in flavor than those sorts grown in the Northern and Western States. The growers of Connecticut seed-leaf, after years of trial in the cultivation of their famous variety of tobacco, succeeded in raising the finest leaf for cigar wrappers known to commerce. In size, texture, color and good burning qualities it has no successful rival among the various kinds of seed-leaf tobacco grown in this country, and lacks only one important quality, namely flavor. As a natural result, it is only fit to wrap cigars, and for this purpose is used for the covering of most of the brands of domestic goods. A few years since some of the growers in the Valley tried the experiment of growing tropical sorts of tobacco, including Orinoco, Latakia, Yara, and at length Havana. The first sort was of good flavor, but the leaf was too short and thick; the second was decidedly too small and is used only for pipe smoking. It is better fitted for the Virginians to cultivate than for the more Northern growers of the weed. The third variety was in some respects a desirable kind to cultivate, since it grew very tall, bearing from 20 to 25 leaves to the stalk, and frequently the former number after being "topped." Finally Havana seeds were planted, and although the results reached were so varied that some succeeded while others did not, many were doubtful as to the practicability of its culture so far North. Many of the failures arising from its culture arose from an imperfect knowledge concerning the methods employed by the Cuban growers of the weed in the selection of soil, etc. At first the principal object sought for by the growers seemed to be the right

Selection of Seed.

It was claimed by nearly all who tried the culture of this sort that it was necessary each year to procure fresh seed in order that the tobacco might be of fine flavor, and thereby approximate in quality to that of the imported leaf. This is doubtless true, but the leaf grown is somewhat smaller and not quite so thin or silky in texture. After some six or eight years of experimenting, it is now generally conceded that seed of the third year's growth is preferable from the fact that the leaf is larger and of finer texture, while it is almost as fine in flavor. It is also much easier to sweat than plants grown from imported seed. Another mistake made by growers was in the

Selection of Soil.

Very many of the first growers who planted Havana seed supposed that the Cubans grew the weed on light, sandy soil, and accordingly acted upon their belief in the matter. The result was, that the leaf grown was leathery in texture and was found to sweat badly when cured even in quantities of from 300 to 400 pounds. The Cubans plant their tobacco in the red clay soil found on the banks of the rivers and small streams that flow from the mountains to the ocean, although quite a quantity is grown on the hill sides adjoining these valleys. These lands are found mostly in the Vuelta Abajo and Yara districts, but the plant is cultivated in other sections of the island; the former, however, produces the finest-flavored leaf that commands the highest price of any grown on the island. A clay soil is well adapted for tobacco, and those growers in the Valley who have selected either a dark or clayey soil, have generally succeeded well in growing Cuba tobacco. Our growers selected a light soil, and oftentimes set out the plants in a protected place by the side of a wood or between two hills, so that the plants might get the sun's rays all through the period of growth. In Cuba, however, the plants grow through the winter months, as they could not withstand the stifling heat of summer.

The culture of the plants is about the same in Cuba as in the Valley, the only difference being in harvesting the plants. In Cuba the leaves are gathered one by one as they ripen and taken to the large drying sheds situated on the "vegas" (tobacco farms) where they are hung up to dry until the humidity of the atmosphere moistens them sufficiently, when they are taken down and tied in bundles or "hands" ready to bale. The Cubans do not pick the leaves until they are thoroughly ripe; hence the Havana imported leaf is not liable to be of the bitter flavor, which it would have if the leaves were only partially ripe. Our growers after topping the plants, allow them to stand in the field from 20 to 28 days, unless there is an appearance of a frost, when if unripe, the plants are usually cut, since bitter tobacco is better than frosted leaf, which is entirely unfit for cigar purposes. Our growers did not make any mistake in applying fertilizers, but used a sufficient amount of well decomposed manure in order to hasten the rapid growth of the plants, in order that the leaf might be of good texture and color.

Last season a large area was planted to Havana tobacco in Connecticut and Massachusetts, especially in the latter State, chiefly in Hampshire and Hampden counties. In the former State the Havana sort is cultivated mostly in Hartford county; but the soil is not quite so well adapted for it as that further up the river. This season a very large area has been planted in Massachusetts, in the two counties named above. The yield per acre is from 1,000 to 1,500 pounds, and it commands about one-third more per pound than Connecticut seed-leaf. It ripens earlier and grows more rapidly, and is easier to cultivate. About 1,000 more plants are set to the acre than of the seed variety, namely, from 7,000 to 7,500. Such has been the success of the Massachusetts and Connecticut growers in raising Havana tobacco, that the Wisconsin growers of seed-leaf tobacco have begun its culture, and have planted a large quantity of Spanish tobacco this season. If its culture is found to be a success in these sections, Havana seed tobacco, as it is called, will take the place of the cheaper grades of imported Havana leaf now so largely used by our manufacturers of cigars.

BLOUNT'S WHITE PROLIFIC CORN.

PROFESSOR A. E. BLOUNT.

BY the time this article appears in print the many inquiries made through the columns of the RURAL, by those who planted my Prolific Corn, will be answered by its growth. Some weeks since in the RURAL I stated that farmers are too apt to overdo in the matter of fertilizing when they have a small quantity of fine premium seed to test. Some—indeed many—I have no doubt surfeited the premium corn sent out by the RURAL. The huge stalks many write about, come from the injudicious application of manures that contain too much stalk food. Alluvial soils, too, almost always make too large a growth of stover and too little grain. A close study of the corn plant, its habits and demands, will soon inform the farmer how to feed, cultivate and select his corn.

I have been improving this corn for nine years and this is the first season it has suckered to any extent. The soil of this locality, being sandy loam, and the climate, make all varieties sucker. More than half my crop became so thick that the sun could hardly penetrate to the soil. You stated some weeks since in answer to a correspondent that I "removed the suckers." I always do; but never in the way most farmers do. If pulled off when young, they will come again and the operation injures the main stalk. They should never be pulled, but cut off with a spud which can be used at the same time to root-prune. Suckers should be removed after—never before—they form the first joint. My crop of four acres is the most promising I have ever had. It is now tasseling. As many as 12 ears appear on many of the stalks. "Colorado," people say, "is no corn country." Cool nights and short seasons work against its ripening. Last year I planted on March 30, and cut up my crop on August 5—130 days. This year I planted on May 7, and if no frost comes until October, I shall make my corn a success. Cool nights I fear will retard it too much. Many call to see and wonder at it. I am still improving it. It is my endeavor now to make the shanks on the lower ears shorter and the cob smaller. Many other improvements I see can be made. One suggests another.
State Agricultural College,
Fort Collins, Colorado.

VETCHES.—This is the great forage crop for horses in England. The vetches are hawked round cities and towns by the bunch, when they first come in, 20 or 30 pounds being sold for about 12 cents, and, as six tons in the green state are a light crop, fifty dollars or more per acre are made by small farmers who are called market gardeners, and as these will be sold by the middle of May a crop of potatoes is grown afterward. These vetches are sown the preceding September and are a winter variety. In this climate the great spring "Gore Vetch" should be drilled in March or immediately the frost is out of the ground, as they are as hardy as the pea. They will then come to a great bulk and gentlemen who have favorite horses and young ones too in the stable, would find a wonderfully beneficial effect from them, for they cleanse the blood and remove all humors, acting medicinally as if by magic. The cause of their not having been used more in the United States has been because when tried, they have always been sowed too late, the land has not been rich enough, and the seed has been of a smaller variety than the "English Gore Vetch" G.

Farm Topics.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life,—EDS.]

"WHENCE THEN COME THESE TARES"?

Weeds eat up the farmer's substance! The truth of this ought to be apparent to every one who would figure up the cost of eradicating them from the crops. And yet it is not an enemy who hath done this. The farmer himself is the one to blame. Just now the fields are white with daisies and white-weed. The stubbles are green with rag-weed. The roadsides are clothed with golden rods, thistles or creeping briers. The door yards and nooks and corners of the farm bear their burdens, and these nurseries of weeds are neglected with the greatest care. Timothy cut for seed is gathered with the daisies; clover is collected with rag-weed or thistle down, and the seeds are sent abroad for sale, thus polluted with foul weeds which are spread far and wide. The thought of this fact recently came home to me in a leading seed store as I examined a bag of Hungarian grass seed, of which one-fourth at least consisted of seeds of weeds. The truth is, we rarely sow seeds of plants desired for crops without sowing with them many kinds of weeds. And if we should ask ourselves: "Whence came these weeds?" we should in truth reply, "Sown by our own hands!"

The ground is more than sufficiently stocked to give us work enough to keep down weeds for the term of our natural lives, but that we should negligently sow fresh seed or permit weeds to ripen their seeds, is a monstrous mistake. There is time now to avoid this the present season, in great part. Numerous pestiferous weeds are constantly maturing; these could be gathered and burned, and we could easily remedy the other mistake by ordering only clean seed, and refusing to accept any other. If this were always done, the seedsmen would be chary of purchasing foul seeds, and would avoid supplying them to their customers.
A WESTERN FARMER.

FARM NOTES.

S. RUFUS MASON.

TRANSPLANTING beets is nothing new; in fact, if they are taken up when about an inch through, the very best crops can be produced by that means, and far better than in the spot they were first sown. The soil becomes packed in the seed-bed, and when the beet is transplanted, the new, loose, warm, rich soil is just in condition to make it grow. There is no danger of wilting if the top is small and the root large at the time the change is made. Transplanting always checks top growth and encourages root formation, hence to grow any root we have only to make a change of base.

The study of the principles of plant-growth is very interesting; no man can fail to learn even from a cabbage head, and if he watches the usual course of events in a garden, many little matters will suggest themselves which may be turned to practical account. For instance, certain plants are very liable to be eaten off by insects during the first few days after they have appeared above ground. Efforts to destroy the insects almost always fail. If you are attacked by a dog and have a stick too light to hurt him with, hold it so that he can bite it, and he will do so; this gives you time and you finally escape. Insects have a choice of food, and frequently like something else better than our plants which we wish to save. Potato bugs like some kinds of potato vines better than others; a row or two of such vines in a field will attract the bulk of the pests and save the patch. Melon bugs like radish leaves much better than melon leaves, and if radishes are planted in the hill the melons escape entirely.

Poisons in a garden or field are dangerous to poultry, animals and people, and are not at all necessary. There are many things which, as the cases arise, may be done to avoid loss on a farm; weeds must be dealt with promptly; insects must be provided for; dry or wet seasons must be offset by drainage or cultivation. If the wheat crop in Nebraska this year had been drilled in rows for cultivation, we should have had a splendid crop of excellent grain and no weeds. Now we have so thin a crop that whole fields are abandoned on account of the weeds, which the crop could not smother.

The proper mode of cultivation on a farm is governed by no set rule, circumstances continually arise which call for something different from what was first planned out. The good farmer is he who plants to allow a variety in modes, as necessity may demand—change of mode, change of times, and change of seed are as necessary as tillage itself. We fatten calves and all young stock by change of feed or pasture, and if we adhere to set rules or do as our fathers did before us, and only because they did so, we violate the laws of advancement. Ruts in a road are indictable here, and the man who allows ruts in his land is on a bad road, but he who doesn't learn from what passes before his eyes every season should go another quarter to night school, and be sure to take a candle with him.

Farm Economy.

PIG AND CORN EXPORTS.

PROFESSOR E. W. STEWART.

WE are given credit for great shrewdness as a commercial people. The Yankee is represented as always seeing the interest side of his account; never standing on trifles, but with eye on the main chance. Yet he is, no doubt, often given credit for more than he deserves. He is certainly a determined trader, but he does not always sell judiciously. He has been prone to sell too largely of the raw material and too little of the finished product. This is quite the opposite of John Bull's tactics, He never sells raw material, but buys much of it, expends labor upon it, and sells the finished product to all the world. England buys largely of grain and other feeding stuffs to make her own meat. We sell her over 60 million bushels of Indian corn and transport it inland and on ocean 4000 miles, for which she pays about 50 cents per bushel, but the American farmer does not receive more than 30 cents per bushel. When this corn is judiciously fed, it will make nine to ten pounds of pork to the bushel. This will bring the farmer, on an average, 50 cents per bushel at his own door. Grain raising with meat production draws on the fertility of the soil but little, and if, temporarily, it paid no more to sell meat than grain, still it would be great economy in the end. But it is easy to see that the farmer, who sends the bulky, raw material so far to market and pays transportation, must be the loser as compared with the man who sends one-sixth of the same

weight in meat. Freights are low, comparatively, at this time, but the same proportion exists as when freights are high. It costs six times as much to send the corn as the pork made from the corn, and the pork will bring ten to twenty per cent, on the average, more than the corn.

Export of Pig Products and Corn.

It may be of interest to RURAL readers to examine the following table of exports of pig products and of corn for 18 years and 11 months, showing a most interesting growth of these articles of our foreign trade.

	PIG EXPORTS.	CORN EXPORTS.
1866....	$17,199,291	$12,199,876
1867....	13,799,785	16,426,597
1868....	18,602,660	15,162,466
1869....	18,646,286	7,476,992
1870....	15,631,507	2,223,251
1871....	23,305,873	8,410,827
1872....	46,063,962	25,199,364
1873....	61,813,718	25,269,421
1874....	58,013,956	26,299,351
1875....	57,692,019	25,747,470
1876....	68,567,061	34,570,307
1877....	82,411,222	43,132,397
1878....	87 939,573	49,365,250
11 mos. of 1879....	74,662,634	36,407,361
	$645,187,687	$327,890,929

It will be seen that the money value of corn exports is one-half, on the average, of that of the pig exports; but the difference in cost of transportation is so great in favor of the meat, that had this corn been used to make pork, it would have brought nearly double the money, or nearly as much as the pig exports. The greater the proportion of our corn fed at home, the better price will the balance bring for export. We should, at least, require a reasonable price for our corn, if exported to grow meat on the other side of the Atlantic. Corn is quoted at 35 cents per bushel in Chicago, and pork at $4.50 per hundred pounds. If six pounds of corn make one pound of pork, this would give 75 cents more for the pork than the corn that would grow 100 pounds of pork. So that pork is relatively higher in this great Western market than corn. But this corn would be fed upon the farm where it is worth only 25 to 30 cents, and the pork would then be worth 20 per cent. more than the corn. Those nations that sell largely the raw material instead of the finished product, are not the most prosperous people of the world. Compare Italy and England, and you have a specimen of each policy.

I trust that this country is making rapid progress in the true policy of working up its raw materials and exporting mostly the concentrated product. Feeding stuffs for animals are too cheap to bear transportation, and it is pleasant to see the rapid growth, exhibited in the foregoing table, in pig exports in twelve years, as the exports of pig products for 1878 are more than five times those of 1866, and they have nearly quadrupled in the last seven years. And another remarkable fact is, that the pig exports are twenty millions more than the exports of all other animal products. No other line of exports, except cotton and wheat, exceed it. Of all our animal exports, then, *the pig is king*. Let this little animal be duly respected.

UTILIZING SEWERAGE.

LONDON has constructed a sewer twenty-seven miles long, to convey the sewerage from her 4,000,000 population out to sea, where it will be beyond the influence of the tide. This is an annual waste of $8,000,000 worth of the best fertilizers. New York and vicinity washes the sewerage of 2,000,000 population into the rivers to be alternately carried by the tide up and down the streams and inlets for twenty-five miles around. Chicago washes her sewerage into the lake from which she also draws her water supply. Philadelphia draws her water supply from the river and returns her sewerage lower down to pay the draft. St. Louis washes the sewerage of a population of 500,000 down the Mississippi, while a very large number of the cities of less size empty their sewerage into the rivers or bury it in vaults.

All of this is waste, a shameful waste of the health and fertility of the country. The same amount of what is thus thrown away, washed into streams to render them foul and obnoxious to health, must be returned to the soil in some way, to keep up the fertility. The immense proportion of the fertility of the soil which is annually removed from farms and sent to be consumed in cities and washed away, will, at no distant day, so impoverish the soil as to cause a serious deterioration in value and productiveness.

If we go back eastward along the track of westward-extending civilization, we shall see but barren plains and plague spots, worn-out, wasted and desolated, where once were great empires and dense populations. Only so far as the tendency to sterility is resisted, are the present nations enabled to exist. The soil from the far East along the path of empire westward, is steadily becoming impoverished, and it is a simple problem to discover how soon Americans must remove westward or save the fertilizing elements of their soils. Some attempts at utilizing sewerage have been made in England, and it is stated that a large proportion of the Paris sewerage is employed to irrigate the plain of Gennevilliers below the city upon the banks of the Seine, and that the result affords a lesson to all other places, of what may be done. That the sewerage of all cities could be withdrawn to some convenient locality, and there converted into fertilizers, is an apparent fact. That from a large city it would be a profitable business, there is no question. All street refuse and sewerage should be collected and returned to the soil, and when systematically undertaken, this disposal of fertilizers will add both to the health of the ity and the wealth of the country. L.

Entomological.

HOW TO COLLECT INSECTS.—No. II.

PROFESSOR A. J. COOK.

The Collector's Outfit.

THE apparatus necessary in the capture and preservation of insects is more simple and inexpensive than that needed by the collector in any other order of animals. The ease, safety and cheapness of transporting specimens, when collected away from home, when sent to specialists to be named, or when it is desired to make exchange of specimens for the mutual advantage of collectors, as well as the small space required even for extensive collections, and the ease and safety of preserving the treasures of our cabinets, specially recommend this field to him who would become familiar with the glories of nature, who desires the most wholesome recreation and who wishes so to employ his spare moments that he shall gather a rich harvest of valuable knowledge for himself and for others.

FIG. 1.

CYANIDE BOULE.—SIDE REMOVED TO SHOW CYANIDE a. AND PLASTER OF PARIS b.

The collector's apparatus may well be considered under two heads: that for making the collections and that for preserving them.

Apparatus for Collecting.

FIG. 2.

Nothing is more serviceable to the entomological collector than the cyanide bottle; for, once in it, all insects soon die, and all except the most delicate moths may be left in it for some time if care is taken to carry it carefully, so as not to shake the insects. The bottle, Fig. 1, should have a large mouth, a glass stopple, and is prepared as follows: After placing a lump of cyanide of potassium, the size of a nutmeg, in the bottom,

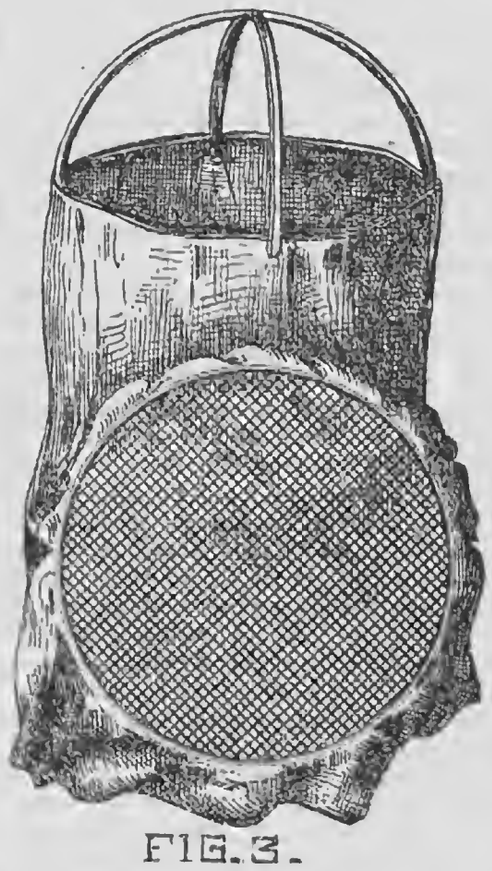

FIG. 3.

Fig. 1, a, turn in a thin mixture of plaster-of-Paris and water till it reaches at least a half inch above the cyanide, Fig. 1, b. This will soon set, and the bottle is ready for use. By having the plaster-of-Paris thin we usually secure a smooth bottom to our bottle. If from bubbles or other cause it is not so, we must rub it till it is. Any roughness is sure to injure delicate specimens. Care must be taken in handling the cyanide, as it is a quick and terrible poison, alike fatal if eaten or inhaled. The fumes in the bottle, though quick death to the immersed insect, are harmless to the collector, if used with even respectable care. The poisoned air of the bottle is as disagreeable as unwholesome, and will not be inhaled for any considerable time, except by him who finds this present life flat, stale and unprofitable, and in this class the entomologist is never to be grouped. Every collector will need at least two of these bottles, one to receive the specimens, after they are killed, or appear to be, the other to put over the specimen as it rests on board or ground, or to receive it from the hands or net. The insect will move about for a minute or two, and had one not removed the previously captured insects, it would be liable to serious injury, especially if moth or butterfly. Several bottles of varying sizes will be found very convenient.

Small bottles containing alcohol, and carried in a pocket case, are very convenient and desirable. In these may be kept temporarily or for a long time, larvæ, pupæ and such mature insects as bees, wasps, beetles, bugs, locusts, etc., which will not receive injury by such submersion. All insects become brittle if kept long in alcohol, and many lose their bright lustre.

Numerous small wooden boxes are ever in demand by the collector, for conveying such larvæ and pupæ as he may desire to rear, to the mature state.

A small but strong chisel will be found very serviceable in loosening the bark of old trees and digging into partially decayed stumps and logs, in which positions are often found very minute but rare and desirable specimens. The skill of a collector may be gauged by the number of minute species in his collections. Untrained eyes will detect the macro insects, not so the micro. To pick up very small species, a pair of small steel forceps are necessary Fig. 2, and quills with close-fitting wooden stopples, are good temporary receptacles for these Lilliputs among insects. To kill such insects we have but to put the quills containing them into a cyanide bottle for a brief period.

Fig. 4

At all seasons, and especially in autumn, many rare and beautiful insects, mostly bugs and beetles, crawl for protection and concealment, under leaves, chips and other fine rubbish. To preserve such specimens, the collector needs a cloth bag with a bottom made of wire cloth with one-quarter inch meshes. This sieve, which serves for the bottom of the bag, should have a strong wire for its circumference. The bag, Fig. 3, I use is about one foot deep, while the bottom is nearly one foot in diameter. To use this we have but to put in the leaves, etc., and then vigorously to shake the bag above a white cloth when the insects will fall through the sieve on the white surface, and can be easily seen and secured. If the white cloth is rubber, it will be well to have it large enough to kneel upon while shaking out the insects, which conserves the strength of the collector, and in damp places the health as well.

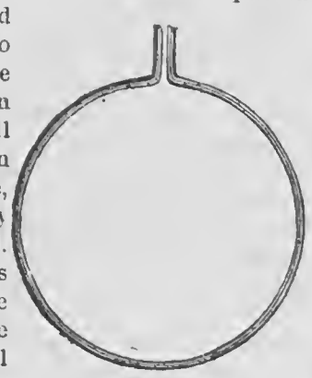

Fig. 5.

The collector will find a large umbrella a very essential auxiliary to his collecting outfit. It will form a grateful shade on hot days, and may be used with wondrous success in collecting beetles and caterpillars. Many larvæ mimic the leaves and branches on which they rest so perfectly, that unless shaken off they will escape even the most skilled observer. To use the umbrella we hold it open, but inverted beneath the tree or branch, then giving the latter a sharp jar, *à la* curculio-catching, when often we will find a catch which will incite our highest enthusiasm, so numerous, varied and interesting will be the shower of insects. Last, but very important, are the nets which the insect collector will bring to his aid. To make a net procure at a hardware store a piece of the largest-sized wire, Fig. 4, three feet long. Get the blacksmith to bend this, with the exception of four inches at each end, into a circular form. The ends must now be bent at right angles to the circle, Fig. 5, welded together and sharpened. A cane or broomstick, with a hole in one end to receive the sharpened end of the wire, Fig. 6, forms an efficient handle.

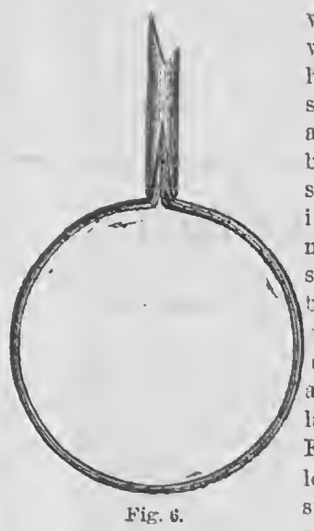

Fig. 6.

We thus have a good frame-work for our net. If our net, Fig. 7, is to be used in capturing moths and butterflies, the bag which is to be attached to the wire-circle may be made of mosquito netting, or better, of Swiss muslin, and, to secure more strength, a strip of strong factory should be bound about

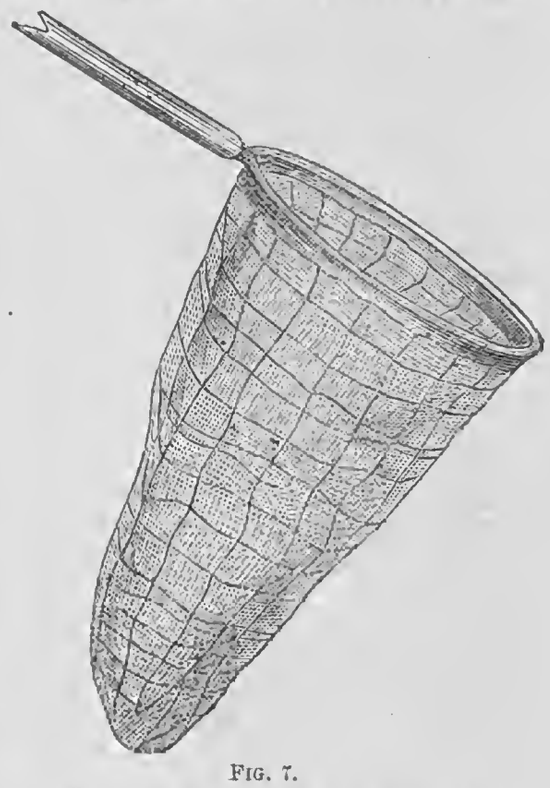

FIG. 7.

the netting where it encircles the wire ring, and be sewed on strongly with it. The bag may be two feet deep. For dredging, the bag should be shallow, not more than eight inches deep, and made of strong fish netting, with the meshes of the twine about one-quarter of an inch across, Fig. 8. A third net, made like the first one described, except that strong factory replaces the muslin for a bag, is very serviceable in whipping bushes and sweeping over weeds and grass, with which one may often do the most rapid and satisfactory collecting.

FIG. 8.

During the warm nights of June and July, and especially of August and September, no entomologist will neglect sugaring for insects. By this process he will secure some of the rarest gems of his cabinet. The method of sugaring is as follows: A liquid, consisting of two-thirds of the cheapest New Orleans molasses, and one-third of stale beer, is placed, as night approaches, upon tree trunks, small boards fastened horizontally to the top of stakes, on fence rails, wood piles, etc. I have had the best success with the horizontal boards, placed among the thick foliage of the grape vines As twilight deepens, or even to 10 or 11 o'clock, the exciting captures follow thickly one after the other. A dozen sugar traps will often keep a person fully occupied. To make the captures we cautiously approach a trap, lighted by a lantern either strapped to the body or held by an assistant. We next decide which moth we shall take, for often there will be a score sipping the sweet from a single board; then carefully place the mouth of an open cyanide bottle over the moth of your choice. If successful, the captured frightened moth rises in the bottle when we quickly apply the stopple, and exchange the bottle for a second one in our right coat pocket. With this we proceed to operate as before at another board, as the moths were probably all frightened away from the first board. This time we not only exchange bottles, but carefully empty the now quiet moth, first captured, into a third bottle, kept in the left pocket. We keep on till we make the entire circuit, when we repeat the round, and thus on so long as success attends our efforts.

Agl. College, Lansing, Mich.

A NEW PATENT AGAINST FRUIT-TREE BORERS.—Somebody, just as I write, has got a patent against the peach and apple borer. It is the wrap of a thin sheet of lead around the crown of the roots, reaching up some inches on the trunk. This is an effective plan, just as are ashes, lime, tarred paper, or any other thing fitted close or piled up around the foot. But quite as good is an open-top, loosely-fitting box, stretching a foot or more above the ground. The first who hit this plan was Hon. Woolsey G. Sterling, of this city. Some 30 years since he devised these remedies for the borer on Peach, Apple and Quince: simply a tube of boards around the tree trunk, fitting the earth closely at bottom and entirely open at top. It should be close enough, I think, to be pretty dark inside its base. But perhaps these close-nailed laths of your correspondent would be just as good a preventive. The borer's progenitor doesn't like to go down into the box to do his work, and the tree still lives. W. H. N.

Bridgeport, Conn.

The Poultry Yard.

EXPERIENCE WITH FOWLS.

In our present state of ignorance with regard to the cause or cure of the different diseases to which fowls are subject, no one can assume to be an absolute authority, or to lay down rules for treatment, that will be effective in all cases. It is only by comparing notes and experimenting that the truth can be arrived at with any degree of certainty. It is reasonable to believe that fowls which have free range, plenty of food, an abundance of pure water, and can choose their own roosting places, are healthier than those which are kept in confinement. Indeed, most writers on the subject ascribe the diseases of fowls to confinement in unhealthy quarters, want of cleanliness, impure, or an insufficient supply of water, or overfeeding and want of exercise. That each of the aforesaid conditions, is a fruitful cause of disease, cannot be denied. That some of the diseases of fowls are contagious, is equally certain. But, while fowls running at large, that have moderate attention bestowed on their wants, are entirely exempt from the unfavorable condition to which fowls in confinement are subjected, it cannot be said that they are exempt from any of the diseases of their kind; though my own experience has convinced me they are less liable to them.

My fowls have been inbred exclusively for the past seven years, and at this time are as strong, hardy and healthy, I am satisfied, as it is possible for fowls to be. Though some writers who are considered authorities, assert that gapes are caused by fowls drinking impure water, mine, which for the past seven years have had an abundant never-failing supply of pure spring water, still have an occasional case of gapes amongst them. I find that a small lump of gum camphor, or half a teaspoonful of sweet oil, with three drops of turpentine in it, is an excellent remedy for the gapes, when administered to the affected fowl. I think it a mistake to put medicine in the drinking water of the flock; the healthy ones do not need it, it is distasteful to all of them, and they will suffer rather than drink it. There have been few cases of roup amongst my fowls for several years. When one is affected, I promptly separate it from the rest. I have tried many things for the roup, and find that frequently washing the head with tepid water, and administering internally a dose of oil and turpentine, once a day, are the most effective treatment. I early made acquaintance with the disease called scruffy or scaly legs. I believe it to be contagious, and to have been introduced, though perhaps I am mistaken, by the larger Asiatics. I gained my first experience with it by obtaining a number of Light Brahma hens to cross with my Games. Shortly afterwards the disease appeared among the Games, and though I tried every remedy I could hear or read of, it remained an eyesore and a nuisance, until I discarded the Brahmas, and decapitated every Game fowl that showed the slightest traces of it, since which time the disease has not reappeared.

For my knowledge of corns or bumble feet, I am indebted also to the agency of the Brahmas. The disease appeared amongst them and their crosses. I can offer no explanation as to the causes which produce it; yet, I fancy it is perhaps, to some extent, hereditary. I found no remedy for this disease except the ax. I killed all that were afflicted, so that they might breed no more of their kind. Formerly I lost many fowls from a disease that is not named, so far as I know. The fowls stood or moped around as if sleepy, and finally died. Upon examination I found the crop much distended and very hard. My mode of treatment is: take a sharp, pointed pair of scissors, cut open the crop sufficiently to insert the finger, empty it and rinse thoroughly with tepid water; then sew up the opening with needle and thread; if the patient is not too far gone when taken in hand, the operation is very often successful. Of cholera—and by the way; are not people in the habit of calling every disease which they do not understand, and which is especially fatal to fowls, cholera?—I know very little. In an experience of fifteen years, my fowls have only once had a visitation of the malady. After keeping them for several years cooped in a small yard in town, they were removed to the country and "turned loose." Soon afterwards they took the cholera (or at least the neighbors said it was cholera). "Physicians were in vain," and about three-fourths of them died. Their exceptional good health since then, I ascribe more to the perfect liberty they have enjoyed, than to any other cause. A proposition that will be found to hold good in all cases, I think, is, that in order to counteract the evil effects of confinement and to strengthen the constitution, frequent crossbreeding is absolutely necessary with fowls, and that, on the other hand, those running at liberty can be inbred for many years without injurious results. Without claiming to be infallible, I have given the results of my own observation and experience in the management of fowls. If I have written nothing new, still what I have written cannot be, to no purpose, if only because it adds the weight of corroborative testimony to what is already known. J. K.

THE POULTRY INTEREST.

A. M. HALSTED.

Only a few years since, the term "chicken fancier" was used in derision by the breeders and "fanciers" of horses and horned cattle; but the fancy has steadily increased and spread, so that now no agricultural exhibition is complete without its poultry department, and, further, it is the only one of the live stock interests which pretends to hold special shows exclusively of stock pertaining to that fancy.

Many estimates have been made of the value of the poultry raised and marketed in the United States, but they can only be approximate to the actual value.

According to the last census, in 1870, there were 44,000,000 people in Uncle Sam's domain. At this time, nine years later, it is safe to compute the number at 48,000,000. It is estimated that the average number in each family is four persons, which will give us 12,000,000 families. Taking the rich with the poor, each family will consume twenty-five dollars' worth of poultry during the year. This will make the value of the poultry consumed in the United States amount to the neat little figure of $300,000,000 per year.

Now add to this the value of the eggs used. It has been computed that each family will consume an average of two dozen eggs per week, which, at 20 cents per dozen (an average price, taking the year through), would make, say $20 per year, or $240,000,000 worth of eggs yearly; in all, $540,000,000 for the poultry and eggs consumed in the United States alone. These figures do not include the yearly sales of both fowls and eggs for breeding purposes, nor the amount of breeding stock necessary to produce the annual supply.

The breeders of poultry may be divided into two general classes: the breeders of pure-bred fowls—"fancy fowls," as they are termed—and the market poulterers. The former raise poultry, some for pleasure, others for profit, exercising as much care in selecting their breeding stock as the largest breeders of horned cattle. In fact, it requires more study and judgment to raise prize-winning fowls than to breed premium Short-horns. Of this class, there are over five thousand in the United States, some of them keeping only one, others keeping five or six varieties, and some having twenty, thirty, and even more kinds. A low average will be two varieties to each person, or 20 birds, which will make 100,000 fowls. These are valued at all prices, from $5 per pair to $100 or more, the average being $10 per pair, which will give $500,000 as the value of the stock kept for breeding purposes. From these estimates we may assume that each of these 5,000 breeders raises at least 50 chickens, which are sold to farmers, mechanics and others, for the improvement of their stock, at $5 each; these will amount to $1,250,000. Then in eggs for hatching, at least enough sittings are sold to make $250,000 more, making a gross amount of about $2,000,000 in this branch of the industry.

The figures above given are much below the actual amounts, but are large enough to show the extent and value of the "Fancy Poultry" interest. With such an exhibit as this, the importance of the poultry industry cannot be ignored; the term "poultry fancier" becomes as well recognized as that of "Short-horn breeder" or "breeder of South-Down sheep," and is really of more general application. In all our large towns and cities are scores—perhaps hundreds—of gentlemen of means and education who have their country residences, and on them yards of some variety of "fancy" poultry, which are the pride and hobby of their owners. Thousands who have neither the time, taste nor accommodation for horses and cattle, find ample exercise for their fancy in poultry, and the spread of the fancy bids fair to soon exceed that for any other kind of live stock.

Floricultural.

CULTIVATION OF FLOWERS.

It is not generally known among the great mass of flower growers, that many rare plants will bloom so profusely as to ruin the plant as well as to lessen the size of the flowers. Especially is it so with a Double Fuschia which I keep out-of-doors in warm weather, sometimes in the open ground, sometimes in pots in half shade. They grow so hardy in this way as to astonish many persons who see them. I often hear exclamations like this: "Why! Is that a Fuschia? Mine grows so tall and slender, and has only five or six blooms at a time, while yours, only about four months old, has some thirty blooms and others nearly out. And so bushy, too!" This reference to the youthfulness of my plant made me measure its circumference, which proves to be forty inches or more. I have robbed it of some thirty or forty buds, and it has yet enough left to make it lovely, the branches hanging gracefully, without any frame or other support but their own strength. I am every year astonished to see so many persons trying to grow such flowers in-doors, during the summer season, often keeping them in a darkened room, thereby shutting off the very life of the plants—sunlight. Nor do they need the glare of the sun, but just enough to make the plants vigorous.

A true lover of flowers will soon learn how much light and air the plants need. There are a few vines—such as the Wandering Jew, or Tradescantia, of different varieties—which do better, perhaps, without sunshine. We have a kind of German or Parlor Ivy, here in Minnesota, which is often grown in many houses without sun, but there is no beauty like a small one I have out-of-doors, which has made rapid strides for thrift during the past few weeks, about half-shaded. Plants and vines want good air for health and beauty, sunshine or not.

Plants by Mail.

If plants are received by mail, which you wish to put in the open ground, you may shelter them beneficially by putting a box—minus cover or bottom—around them, and during the sunny part of the day, keeping a wet cloth of some coarse material, over the box, taking it off at night, and then removing it by degrees slowly in the daytime, letting the box remain till the plants are growing well. I spoke of this in the Rural, some three years since, but perhaps will be excused for repeating it as above. It is a matter of regret that so many plants die for want of care. Some are kept too dry, and others with water standing in the pot; others, still, in too small pots.

Starting from Slips.

A pleasant kind of labor with flowers, is this. There is, however, an erroneous idea about large slips being necessary. Small ones are far more sure of growing. I have started some Geraniums and Roses, with slips not over an inch and a half in length. It is a good way to put glass over them if you give them air once or twice a day, but glass is not necessary. One may succeed well without it, even with common soil, if they are kept in shade till they begin to grow, which generally indicates the formation of roots, but not always. All transplanted plants or slips do best when the roots grow first. I have sometimes started slips in the open ground by putting hazel brush with leaves on, around them sufficient to let the air through, and keep the sun out until they struck roots.

Minnesota. Aunt Jennie.

Industrial Topics.

AGRICULTURAL DEPRESSION IN ENGLAND.

Every statement relating to agricultural distress in England must be read with some allowance for exaggeration. I have experienced several of these periods of low prices and bad harvests. Meat still sells at a good price and all the best farmers turn all their low-priced produce into meat, wool and dairy produce, which is none of it so low, comparatively, as grain. It is only the tenants who have not capital enough to keep the best meat-producing animals who are suffering.

It is indeed, a great blessing that "the British farmer is not permitted to follow the system in agriculture which seems to him the most advantageous for his own interests, but must conform to the regulations which the landlord deems most conducive to his own benefit, etc." It is this which has saved British soil from running down as the land has in the United States. If the English farmers had not extended root culture and used other produce, too, to enrich the soil, the fact of the tenants there growing more than double the yield of wheat and barley, would not have occurred, for the farms would have been run down the same as they are here.

When a good season comes, the land in England will bring forth double the number of bushels per acre grown in America, and her rich old pastures and her millions of acres of roots, will produce beef, mutton, wool, etc., in the former abundance, while the farmers in the United States will wear themselves out on their worn-out soil, and the virgin soil in the West will be despoiled by the Vandals who spare none of the lovely grazing lands which have fattened the buffaloes and deer for centuries. There is no instance of any leading English farmers complaining of fox hunting as a grievance. If there is ever any sensation attempted of that sort, it is always by some merchant tradesman; perhaps a tailor who has made a few thousands and rents a farm, which, as he knows nothing about farming, soon gets into difficulties which are ascribed to any but the true cause. Farmers who have plenty of good live stock cannot be doing amiss at the price beef and mutton are selling at; for I have farmed and made money easily when prices were much lower, and the farmer spoken of in the Rural, who rented 600 acres, unhappily was not bound to any system of rotation hence the cause of his ill success. Just read some of the accounts of his management: He had only 140 breeding ewes and could not have grown proper roots, or the lambs would not have died in the autumn. It appears he has made £800 ($4,000) per year profit for nine years previous to the three last; so that, supposing all to be true, he must still be a great gainer from this 600-acre farm; for a tenant farmer could live well enough on half the sum he made, and according to that he ought to have $12,000 and the interest after his three years' losses. Depend upon it, this man had a first-rate farm, and not being restricted, he taxed the farm pretty hard during these nine years of flush times; for if he had consumed most of his produce on the farm, he would have derived his income chiefly from meat and wool, and as meat and wool have not gone down much, I can't see how his income can be so seriously affected. It is strange, but true, that American gentlemen should find fault with English customs of rotation and restrictions, which they must know have kept the land in the highest state of fertility; while the soil of the Eastern States has all been brought to such a low condition, that some of the States as large as England, do not produce one-tenth as much grass, one-twentieth as much cattle, one-hundredth of the number of sheep, or one bushel of wheat for a thousand grown there, and it might be said not one pound of wool for 500 pounds grown in England. At the present moment, there are, on an average, ten applications for every farm at liberty to be rented, and although there has been an increase in the bankruptcy cases in farming, the same as there has in the mercantile classes, yet there are more than a thousand failures in trade for every one in agriculture. With regard to fox-hunting, almost all the large farmers enjoy the chase as much as the aristocracy, and most of them breed young horses which they ride for a season or two, and then sell for a good round sum which pays them well for raising them. Should any little farmers receive injury to their crops or fences, or any of their wives lose poultry from the depredation of foxes, the owner of the hounds, or sometimes gentlemen who hunt with the hounds, will pay for the loss sustained immediately they hear of it. Farmers feeling above receiving money, will be sure to have a handsome present of game or venison, as an acknowledgment of having allowed a litter of cubs to be raised undisturbed on their farms.

G. G.

Remarks.

Here there is space only for a few brief remarks on the above communication. It is readily conceded that in all cases of public excitement there is a natural tendency to exaggeration in reference to the subject that has aroused general interest. With regard to the present agricultural distress in England, however, nothing that has yet been said on the matter in American papers approaches in strength the language constantly employed with regard to it by public speakers, agricultural and political papers and cautious statistical writers in Great Britain. "Terrible crisis" "deplorable agricultural prostration" "ruinous losses" "unprecedented disaster" are a few specimens of the expressions which characterize it in one of a bundle of English agricultural papers beside us. It is certainly wise to guard against exaggeration; but often there is more wisdom in guarding against depreciation.

The success which attended the skill and foresight of our friend during former periods of agricultural depression in England, makes us rejoice that these admirable qualities have since been transferred to the aid of American agriculture; while at the same time it is just permissible to doubt that they would be equally profitable in the present condition of farming across the water; for it is conceded on all hands there that at no time within the memory of any one now living, has that condition been so gloomy, and even our correspondent will admit that his efforts were never embarrassed by such keen competition with foreign agricultural products as that which now robs the British farmer of courage and shekels.

The landlords' restrictions upon the tenant-farmers' liberty of action, of which our friend, 3,000 miles away, approves as the chief safeguard of the fertility of the British soil, farmers on the spot are now vigorously combatting. Within the last couple of months not a week has passed in which English agricultural papers have not recorded the protests of farmers' clubs, farmers' associations, Chambers of Agriculture and prominent individual agriculturists against the damage done by these "beneficial" regulations. Dr. J. B. Lawes, surely no insignificant authority, has long been advo-

cating their modification, and has frequently, in his writings and addresses, pointed out their evil effects. Among 10 essential parts of high farming enumerated by Mr. Mechi, in the Farmers' Gazette of 2d inst., No. 5 is: "Freedom of action as to cropping, selling and general management of the farm." The Farmers' Alliance is steadfastly hostile to these restrictions, and is about to press their abolition, or at least their radical modification, upon the projected Royal Commission. Its president, Mr. James Howard, in a recent letter to the Times, quoted in the Agricultural Gazette of July 21, makes a strong plea for their removal, and fortifies his position by two examples, one of the good effects of their absence and the other of the injury done by their enforcement. If there is one grievance which the tenant-farmers of the country find more oppressive than another, it lies in these one-sided regulations.

"There is no instance," says our friend, "of any leading English farmer complaining of fox-hunting as a grievance"—he should have added, "within my recollection." During a residence of a dozen years or more among farmers in the North of England, the writer heard a large number of complaints on this score, and that, too, from some of those who were locally considered "leading farmers," although our friend may deny them that title, on account of their complaints. True it is, the grumbling seldom directly reached the ears of the landowners, especially from the lips of tenant-farmers; but what it lacked in loudness it "made up" in depth. Of course, in the "hunting counties," the injury done by the amusement is regarded as one of the inevitable evils of life, and is therefore more patiently submitted to; and there it brings not a few counterbalancing advantages in the way of trade. Of the lordly generosity or voluntary justice of the huntsmen, spoken of by our correspondent, "there is no instance"—within the writer's recollection; although, no doubt, such largesses are occasionally bestowed.

Our friend "points with pride" to the excess of agricultural products per acre in England over those of some parts of this country; but he has forgotten to speak of the extra cost of such productions. The English tenant-farmer's capital averages from $40 to $45 per acre, and it seems universally agreed that, to produce the best results, it should not be less than $100 per acre—which should be the least amount of a freeholder's capital. In what part of this country does the average capital of our farmers amount to this sum? Yet American farmers are growing prosperous while their transatlantic cousins are becoming impoverished—unless they clamorously belie their own condition. The fact seems to be that, while we may learn many useful lessons from the practices of British agriculture, it would be the hight of folly for our farmers, under their present conditions, to adopt the costly methods of farming practised in England. In the most notable case where the experiment was made here, it ended in a disastrous failure.

In view of the growing competition with importations of foreign cattle within the last few years, it is a trifle doubtful whether the transformation of agricultural England into a vast stock farm would be the panacea for all her agricultural misfortunes, which our friend seems to think it. In any event, in view of the estimate that one-fifth of the cattle in the country are yearly sent to market, and two-fifths of the sheep, such a transformation would be the work of years, besides sending abroad a large proportion of the small farmers and agricultural laborers who would then find no employment, and utterly ruining the various branches of industry at present supported by the current system of agriculture.

With regard to that 600-acre farmer, some of whose shortcomings our correspondent lufers, while he guesses at others, there is no intention here of defending him. His communication to the Times was copied in full into our English, Irish and Scotch agricultural "exchanges" as affording a fair idea of the losses from which British agriculture is now suffering. The writer was reported to be a thoroughly practical farmer; skillful in his calling, careful in his methods and fortunate in his leasehold. Were his losses exceptional, we should be disposed to attribute more weight to the faults our correspondent finds with him; but as the average loss to British farmers last year is estimated by the best authorities at over 20 per cent. of their yearly income, it seems fair to regard the mishaps or faults of this man as typical of those of English farmers generally.

From what source, beyond his own inward consciousness, our friend has learnt that at the present moment there are, throughout England, ten applicants for every farm to be let, it is impossible to imagine. That may be the case in a few isolated parts of the country, but unless all the English papers and the English correspondents of American papers, that refer to the matter, are grossly mistaken, our friend is—well, inexact. According to these authorities, in many parts of the country farms are "going a-begging," and tenants can often make nearly their own terms for them. So late as two or three years ago, the Duke of Argyle expressed the idea that the demand for farms was practically inexhaustible, and thousands less notable agreed with him, but recent events have given this notion a rude shock, as Mr. Howard remarks in the above-mentioned letter.—[Eds. Rural New Yorker.

Miscellaneous.

WHAT OTHERS SAY.

Clover Catch—Summer Fallows etc.—We take the following from the always interesting proceedings of the Elmira Farmers' Club as reported in the Husbandman: Judge Balcom said: The great mistake in seeding with clover is in sowing too late. Get the seed in early, before the ground has settled down hard, and there will be no difficulty. You need have no fear about frost for it will not hurt the young clover. It is not half as bad as dry weather in May, for that is almost sure to ruin clover sowed late and it puts back even the early-sowed.

W. A. Armstrong said: Farmers talk of summer-fallowing with little understanding of its purpose. They seem to assume that it should increase the yield of the succeeding crop vastly, and when they find that it does not they are ready to condemn it, although I have not heard until now that it increases the spread and growth of weeds. The true uses of a summer fallow are: 1st, to destroy weeds by promoting germination of the seeds and afterward destroying all growth; 2d, to fit the land for subsequent crops. I do not say the labor will be repaid in the succeeding wheat crop, but I affirm that with the work well done, the benefits will be received by many subsequent crops.

Mr. Miller. Top-dressing is my plan. Harrow land no matter how much after the manure is applied; but the manure on the surface is the best plan.

Dr. Cuddeback. Will it do to plow timothy and sow wheat on the inverted sod?

Judge Balcom. The best wheat I ever raised was obtained in that way. I turned timothy sod the last of August and first of September and sowed wheat in the usual season. I had forty bushels to the acre, the only time I ever had so great a yield.

W. A. Ward. The best crop of wheat I ever raised I got from a seeding made just after the field was plowed. The very day I finished plowing, the seed was sown. I know it is not regarded as the best way. Most farmers believe land should lie some time after plowing before the seed is sown, but in the case reported there was full success with the seeding made on the newly-turned soil.

D. W. C. Curtis. Last year I summer-fallowed part of a field, turning under timothy and clover when a foot high, or more. I plowed it twice. Five acres were so treated and another five acres were plowed just before seeding. On the summer-fallowed lot I had less wheat and more weeds.

Col. Brewer: For wheat I prefer once plowing and frequent stirring of the surface afterward by cultivating or harrowing. That summer-fallowing kills weeds no farmer will deny. I have killed Canada thistles by frequent plowing. In one case I plowed six times during the summer, and this completely destroyed the thistles.

Pears Withstanding Blight.—The four varieties which on an average through the country have withstood the blight with fewest exceptions, are Duchesse d'Angoulême, Seckel, Winter Nelis and Anjou, says the Country Gentleman. Time and experiment will doubtless add others to the list. We observe that the Canada Horticulturist speaks of the Doctor Reeder as escaping where others have been destroyed. It is a seedling of the Winter Nelis, and partakes of the hardiness of its parent.

"The Pentstemons.—What we have seen this summer of the wild Pentstemous, on hillside and rock, convinces us that all the different species merit wide favor in our gardens. In point of healthiness and capacity to endure the hot sun, as also in brilliancy, and continuous blooming power, they certainly hold a leading place among those garden perennials which have flowers arranged in clusters, umbels, or spikes. The large hybrid Pentstemous are glorious; yet we know of no collection on this coast, and of but few single plants. The flowers are Gloxinia-like, and have nearly as much variety in shade and markings as the best Gloxinias, though they are considerably smaller, and are differently arranged."

We clip the above from the California Horticulturist, and would add that we believe some of the new sorts are destined to create a "floricultural sensation" ere long. We shall have more to say of them in our fair number.

Plowing for Wheat.—Rural, Jr. says, in his interesting notes in the Chicago Weekly Tribune, that in the early cultivation of all new countries, the soil is not plowed deep. As the farm grows older, the plow goes down deeper, and the wheat-crop grows poorer with each succeeding year. Careful and observing wheat-growers, who have had many successes and few failures, have observed these facts; and now, instead of wanting a deep, friable bed on which to sow wheat, they adopt the opposite. Ground intended for a crop of winter-wheat should be plowed as soon as possible, be it oat, wheat-stubble, or meadow. The plow should not be run over four inches in depth: and the soil should be left in a rough state until germinating weed-seeds make it necessary to harrow it. The oftener the ground is harrowed, and the closer the soil is packed, the more certainly is there to be a good crop. As a general thing, we put off the plowing until later in the season; but now is the proper time. We would urge this upon all those who intend to grow a crop of this cereal next year.

Angle-Worms as Agencies in the Formation of Loam.—E. Lewis Sturtevant, M.D., says that along the edge of the backwoods in Eastern Maine, he noticed that the new land was not black in color as is loam, but rather of a gray or light-brown cast. Only in the meadows and along the moist edges of the meadows did the soil appear black. Some years since, some angle-worms were buried in a suitable spot to serve as a nucleus for a permanent supply of bait for fishing. This spot, now occupied rather sparingly by the worms, has taken on a dark appearance, and is the only spot resembling Massachusetts loam that is to be observed in the vicinity. So far as he has observed, loam only appears in localities where the angle-worm is to be found, and he from experiment knows that this worm is capable of transmuting white sand covered by a vegetable layer into a fine-appearing loam in a short time.

"A Matter of Surprise to Many."—In the Home and Farm (Louisville, Ky.,) B. F. J. says: "West of the Rocky Mountains, in California, where the climate favors the production of table grapes of good, if not first-rate quality, and where wine grapes grow as they grow nowhere else in the world, the wine-makers have ascertained that the liquor produced from them is little better than that which can be 'manufactured from molasses and water.' Indeed, California wine, when thrown on the markets of the world, has been pronounced 'worthless stuff,' and the vine-yardists, accepting the fact and the situation, are abandoning the business just as fast as it is possible to do so." This, "B. F. J." says, will be "a matter of surprise to many," for which reason he fortifies his statement with a narration of facts from authentic sources,

Mules.—"Waldo" says in the Ohio Farmer that after eleven years of experience with mules on the farm he considers them far superior to horses, and would always recommend, where two teams are kept, that one should be a mule team. They are better than horses for the following reasons: They endure the heat much better and are not so liable to sickness or injury, and when lamed or galled, they recover much sooner than horses. They also have greater endurance and will do more work. They require less feed and will last many years longer than horses. Notwithstanding the prejudice existing against them, they are, as a rule, as trusty as horses and more responsive to kind treatment.

Change.—"We are sorry to learn, ("we, too, are sorry,—that Prof. C. L. Ingersoll, of the Agricultural College, Lansing, Mich., has decided to accept the position of Professor of Agriculture in Purdue University Lafayette, Indiana. He has been a hard-working and faithful member of the faculty of the College, and one whose place will be hard to fill. The Lansing Republican speaking of the causes which led to Mr. Ingersoll's leaving the College, says: "Better salary, and less fault-finding from outside ignoramuses, are the reasons for Professor Ingersoll's seeking a new field."—*Mich Farmer.*

Hint for August.—A wide-awake farmer, whose purse permits, should take a few of these sweltering days in August and take a look at the outside world, suggests Mr. Hyde, in the N. Y. Times. If his home is in the interior, he should visit the sea-shore, where he can breathe salt air and see men and women who affect style and refinement. If he has a level head, there is no danger of his becoming discontented with the simple style of his own home by seeing the dress, manners and equipage of the fashionables who resort to the watering-places and claim to be the upper crust of society.

Agricultural Colleges.—The New England Farmer says that it is perfectly aware that our agricultural colleges are not, as yet, what we might wish them to be, but it must be remembered that they are still young, and while having had very little of the experience of others, to profit by, they have had any amount of opposition from those who should be their best friends and supporters.

Depth to Sow Wheat.—A great deal has been said first and last as to the depth at which to sow wheat, remarks the Prairie Farmer. Experiments have shown that upon ordinarily compact and moist soil, wheat germinates most promptly and produces the strongest plant when sown at a depth not exceeding one inch; from thence up to six inches it came more and more feebly.

To Purify Cistern Water.—But suppose, says Geo. Geddes in the N. Y. Tribune, the water has become offensive, and it cannot be spared, how can it be made fit to use? A bushel of hard-wood ashes, suspended in a sack in a cistern of 100 barrels capacity, has accomplished this object with entire satisfaction in two cases that have come under his observation.

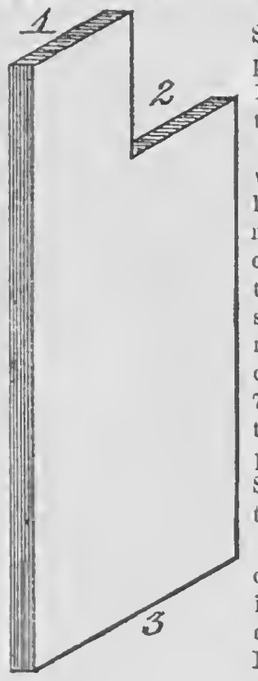
Scraping Hogs by machinery is one of the innovations adopted by the packing-houses of Chicago. As the animals pass over revolving flukes they are scraped clean at the rate of 10 hogs per minute. This process occasions an immense saving of time and of manual labor, while the work is done quite as thoroughly.—*Germantown Telegraph.*

American Style of Gardening.—Prof. Meehan says: "It is a pleasure to note the growing style of gardening favors a distinctively American one. Europeans cannot have the things we have, and we may as well avail ourselves of these, as to be copying inferior ideas from them."

Ropy Milk from cows, "Grandmere" writes us, is caused by eating straw from a manure pile, drinking pond or other stagnant water, suffering from want of salt, or from violent exercise in the hot sun; and any of these causes will make the milk stringy or ropy, in which condition it is more or less poisonous. The preventives are: good feed, plenty of salt, clear water, shade in the pasture, and a trustworthy cow-boy, who knows better than to run his charges.

PAMPHLETS AND CATALOGUES.

Scientific Horseshoeing for the different diseases of the foot. By William Russell. Published by Robert Clark & Co., 65 West Fourth street, Cincinnati, Ohio. This work is the result of the experience of a man who has been practicing farriery for forty years. Its aim is claimed to be to give the practical details of the most approved and rational plans and principles of horseshoing, in the plainest and most complete manner. A large share of the work is devoted to the "Diseases of the Foot," and the subject of pathological shoeing is fully treated. The work is printed in large type on tinted paper, well illustrated with 55 handsome cuts, neatly bound in cloth and sells for $1.



Wagon Jack. — See p. 538.

Report of the Chief Signal Officer—War Department—for the year 1878. This costly contribution to the old paper dealer is furnished with so many plates and has evidently required so much careful work, that one cannot help regretting its inevitable consignment to the paper mill unread in nineteen cases out of twenty. Its 700 or more pages contain a multitude of reports from the various Signal Service posts throughout the country.

Our friend W. C. Drew, of El Dorado, Cal., has issued his first annual catalogue of California Lilies and native bulbs. Among them are Liliums Humboldtii, Washingtonianum, Pardalinum; Cyclobothras, Calochortus, Brodiæas, etc., etc. We wish great success to this enthusiastic young florist.

Analyses and Statistics of Commercial Fertilizers inspected, analyzed and admitted to sale in Georgia. During the season 1878–'79. Cir. No. 66. Department of Agriculture, Atlanta, Ga.

William H. Moon, Gleuwood Nurseries Morrisville, Bucks Co., Penn. Descriptive price-list of Strawberry plants (pot-grown and others) for the present season.

John S. Collins, Moorestown, Burlington Co. N. J. Pamphlet of all the new and valuable Strawberry plants, potted and otherwise.

Reports upon the condition of crops, July 1, 1879. This is one of the usual pamphlets issued by the Department of Agriculture.

Pinckney's United States School and College Directory and Guide for 1879. T. C. Pinckney, publisher, 30 Union Square, this city.

Circular Letter from the Commissioner of Agriculture relative to the manufacture of maize and sorghum sugars.

Everywhere.

NOTES FROM FLORIDA.

The weather here since the first of July has been extremely warm, the thermometer having been as high as 108 degrees in the shade once or twice, and a great many days from 95 to 98 degrees. This is the warmest weather ever known in this section, so say reliable people who have always lived here. To Northern people who have never been here in the summer, I suppose it seems as though the heat must be almost unendurable; but it is not so; there is always a cool breeze either from the ocean or the Gulf, which tempers the heat of the sun so much that a hot day here is more comfortable than at the North. We never have any of those still, sultry days when it seems as though every breath of air came from a furnace, and which make one feel too indolent to do anything but try to keep cool. Sunstrokes are very rare, and we very seldom hear of any bad effects from the heat either to man or beast. The darkies will hoe cotton the warmest days from sunrise to sunset, and never complain of the heat, but white people try to keep in the shade during the middle of the day as much as possible. I had occasion, on one of the warmest days, to take a four-mile ride in the hottest part of the day on horseback, with the sun pouring down on my defenceless head. Such an exposure at the North would have sent me to bed with a raging headache, while here I felt no bad effects from it at all. We have had heavy showers nearly every day since the Fourth of July, and yet we have none too much rain unless on very low land with insufficient drainage.

Crops are unusually backward, but looking good where they have had good cultivation. We picked our first cotton on August 2. We picked the Blount corn for seed on July 26. The stalks were very small; one had four good ears; a few had three, and the rest two, with more set that did not come to perfection. We have only kept the best for seed and shall plant no other next year, as we are satisfied that with proper fertillzation it will yield much better than the kind raised here. The soil where it was planted was poorer than we thought, and we did not fertilize it enough. We have learned a good deal about corn this year, thanks to the RURAL. Our Voorhis watermelons were good; the two largest weighing 20 pounds each, but some of our Iceland weighed 30 pounds. The largest one sold in Starke weighed 52 pounds. The Iceland is certainly the finest-flavored melon I ever tasted, but it should be borne in mind that watermelons grown and eaten here, taste very differently from those grown in a colder climate, or from those picked here before they are fully ripe and shipped North to ripen on the way. They are so much better here that I think if I should go North again, I should never care to taste one. The Acme tomatoes were the finest I ever tasted; they also reach a degree of perfection, ripened under this semi-tropical sun, never obtained at the North. I have some plants from the Hibiscus seed the RURAL sent, nearly five feet high and blooming finely the first year. I think we have seed enough from the Pearl Millet to seed half of Florida, and we have only allowed a few plants to go to seed; the rest we are still cutting for fodder. One seed head measured 24 inches in length, and four in circumference. When the seed heads are cut, the plants put out new ones from the joint below, and the stocks are making another crop of seed. It has been grown in the rich hummock lands for some time and has been tried here, but with no success until this year, for the reason that they did not understand that it would not grow in this soil without heavy manuring. It has only been tried in small quantities as an experiment this year, but next year I think there will be a good deal planted. One man who saw ours, told my husband he wanted a peck of seed. I think if he plants a peck of seed, he will not plant much else on his farm. The problem, how shall we furnish fodder for cows and horses is a serious one here, and anything that will help us to solve it, is worth a great deal.

MRS. INCREASE SUMNER.

Bradford Co., Aug. 4.

KANSAS NOTES.

Since writing you about a month ago, we have had, with slight intermission, a succession of very hot days, with, for a wonder, light and intermittent winds. The heat has been more intense than any time within five years. Till Sunday last, and the two succeeding days, the thermometer in my sitting-room was at no time higher than 98 deg. On the days named, it was 101 deg. and 102 deg. The manner in which vegetation shrivels, under such temperatures, accompanied, as they are, by an absence of dews, and unusually warm nights, may be called rapid. Kansas does not suffer, hardly ever, from protracted absence of rain but from extremely rapid evaporation. You will see a rainfall of two inches, in the night, and the dust blowing from the road the evening of the next day. This may be strange, but it is true. Our crops in this section will prove above the average certainly, but were one to believe all the sanguine Kansan believes or tries to *make believe*, we should say they were not only unprecedented but so large that difficulty would be found in moving them to market. There is a singularity in the opinions that were entertained regarding the present wheat crop. In the month of April the western counties—which are *the* wheat counties—were represented as having the promise of the largest crop ever raised. We down here, had the most unqualified opinion that we should and must have a very inferior crop. The results from the harvest are that *they* have one-third of the crop predicted (say seven bushels) while we have three times the amount we expected (20 bushels). Our crop varies from 10 to 35 bushels, with light straw, and full heads. Our corn crop will be good, probably very good, possibly magnificent. The only detriment to the last may be the general prevalence of the chinch bug. If the pest be partial, as we think, then there will be a magnificent and an early crop. Perhaps I can tell you another strange thing—there was a load of new husked corn in Parsons yesterday, which was sold for feed. My Junior sent it, and (with pain, it was said, because he would like his father to have the biggest corn) the ears were 10 to 13 inches long, and as our ears have from 10 to 18 rows on the ear, it does go to show we shall have *some* corn. Our oats were short emphatically, and the same must be said of the hay crop. Castor beans are one of our staple crops, and this season they are unusually good. Potatoes are indifferent, both in quality and quantity. Ordinary culture, under our long and intense heats, does not succeed—we have had but one good crop in five years. Mulching succeeds, and of course irrigation would succeed. Rates on this market, are: wheat (prime winter), 75c; corn, 25c; oats, 18c; castor beans, $1.00; prairie hay, $3.50; potatoes, 50c; coal, $2.50 per ton; flour $3.00 per 100 lbs; fat cattle $1.75 to $2.00; hogs, live, $2.50; butter 12½c; eggs, 8c. Watermelons have literally been piled upon the market at the rate of two and three cents apiece. This place is growing fast—from 100 to 300 houses have been built so far this season—partly caused by an influx of immigrants who settle here in the expectation that this will be one of the points of junction of one or more of the several railroads that are now being constructed or projected to the west and northwest.

Some of us expected that with the resumption of specie payments there would be a contraction of credit, and consequently harder times. Now, even here, we see plainly the contrary has occurred. Railroads are extending westward to the tune of hundreds of miles. Nails and calico are both up. So man proposes, but God disposes. It is well settled that in Texas, and perhaps in all the Southern States it is an impracticability in the hot summer months to raise vegetables with a reasonable certainty without irrigation. It is certainly so here, at least the way we grow them does not succeed. There has been an exceedingly small growth in all vegetation this season, except corn. Why is this thus? Is it that we are apt to consider that corn must be cultivated three or more times, and that vegetables are generally planted for hand culture, and this kind of culture is given them about once, if at all. It seems there is something in cultivation that makes things grow. Our hedges and trees have not made half a growth. Our oats and wheat were very scant in stem and foliage, and yet the only thing that we do care for—the only thing we are scrupulously careful about in seed, in planting and cultivating, succeeds in growing in spite of a succession of droughts which "finished" most of the articles the nurseryman furnished for this season. Even here there are a few that are afraid to cultivate dry ground, but they are becoming beautifully less. J. B.

Parsons, Labette Co., Aug. 7. 1879.

NEBRASKA NOTES.

In the RURAL of Feb. 15 I threw out a suggestion, that we be given a binder combined with a table-rake, and showed the advantages to be gained. My suggestion, perhaps, was the "shadow" cast before "the coming event," which is now in the field and called a platform binder. The binding attachment can be used, or it can be removed and the machine operated as an ordinary table-rake.

The unique plow which was figured and described in the same number, I have been using through the season, and I find it to be more valuable than I anticipated. I broke fifteen acres before the plow needed to go to the blacksmith's shop for sharpening. It is not as good as the slanting-cut for opening a land, but better for finishing, as there is no gauge wheel in the way. The draft is about one-third lighter. It is not so good when the ground is very wet as from medium to nearly dry. I would say to my brother farmers, if you have buffalo sod to break, don't hesitate to order a square-cut plow to be made, even though you have a new slanting-cut on hand.

"Evergreens won't live in this country" is the opinion of nine-tenths of the people in Nebraska. I think there are two causes of their mortality, that cover more cases than all others combined, and causes, too, that can be obviated. First: the roots are exposed either to sun or wind, or to both, until the trees are dead, before they are planted. Second: evergreens are usually desired to grace the lawn, hence on their arrival, a hole is speedily dug two feet wide and one foot deep, and the tree planted. Nine-tenths of our natives would die under such treatment. My advice is: plant half the number of trees desired, but plant them in mellow soil and feed the roots liberally on water, and then shade them, and your evergreens won't be ever yellow. Let no grass or weeds grow within six feet of a tree.

More convenient than a boot-jack at bed-time is a lifting jack when the farm wagon or carriage is to be oiled. Better than all the patent jacks—and they are legion—that I have seen, is a simple one that I have used for years, which did not take more than five minutes to construct or cost more than five cents for material. Make one to-day and try it. Take a piece of inch board ten inches wide and from one and a half to two inches longer than the hight of the hind axle above level ground. Measure from one end of the board a distance one and a half or two inches greater than the hight of the front axle, and then saw the board half off. Cut out the corner, leaving your board as shown on p. 537. One made of hard wood would be better, but pine will do pretty well, by binding the ends with a scrap of hoop iron. *Modus operandi:* Place the end 1 beneath the hind axle, the end 3 resting on firm, even ground. The board will stand inclining. The wagon or carriage can easily be moved forward or backward as the case may demand, until the board is perpendicular, when the wheel will be free. Fig. 2 is for the forward axle. Its weight and convenient shape make it a *vade-mecum*. Suppose on the road with a heavy load, a wheel commences to "curse the driver," how easy to place the board in position in front of the axle, let the horses move the load forward a few inches, and the wheel is free. If there is any other lifting jack that can be run by horse-power, "I elevate the sponge."

I think I saw, some time ago, in the RURAL, the statement that Pearl Millet would not mature its seed in northern Kansas. I have it now growing in southwestern Nebraska, from seed which I saved last year.

Boys, did you ever get into trouble with the old gun? I did when a boy, and so did my boy the other day. As a prelude to a ducking excursion he attempted to clean the gun. He wrapped a bit of cotton cloth about the end of the ramrod, wet it, and rammed it into the gun on an exploring expedition. It went in readily, but refused to come out. A pound's pressure would thrust it farther in, but a hundred pounds' pressure could not withdraw it. I knew it was almost impossible to unbreech the gun, and was thinking of some acid to eat away the cotton cloth, when the good woman suggested soft soap. Some, new and warm, was at hand; a tablespoonful was turned into the barrel, and in a minute the ramrod came out as easily as a rat's tail out of a jug of molasses. Boys, soap the barrel to clean it quickly, rinse it thoroughly dry and oil it, then bang away. R. H. CRANE.

Harlan Co., Neb.

RURAL SPECIAL REPORTS.

Mass., Cambridge, Aug., 1879.—Times are better this year than they have been since the panic, but as margins are narrow, a deal of business has to be done to make it pay. Laborers and mechanics have all the work they can do in the mean time; laborers' wages average 12½ cents an hour; mechanics', 13½ to 20 cents. Clerks, salesmen and printers, in places, stick closely to their situations, as the supply of men is immensely in excess of the demand, and their pay is proportionately low. On account of cheapness, ladies are being employed, to a great extent, in place of men, for light work; but school-ma'ams are, perhaps, the best paid, easiest worked and most discontented of all female servants. They get from $300 to $720 a year, and a long vacation, too.

F.

Conn., Clinton, Middlesex Co., Aug. 12.—We cut to-day some Pearl Millet raised from seed sent by the RURAL. It was six feet and it had only ordinary culture. I think it worthy of cultivation. W. A. D.

N. Y., Garrettsville, Otsego Co., August 5.—Crops, including corn, oats, wheat, and potatoes, are good. Buckwheat promises well; hay is mostly stored and it is a good crop.

R. T.

Penn., Hosensack, Lehigh Co., Aug. 9.—We have a wet season just now, and corn looks very good and promises a good yield. Oats were very good, but winter grain was not half a crop, especially wheat. Rye was good in the straw, but not in the grain. Pasture is plentiful and cattle are in a good condition. The weather is very warm with occasional showers. H. E. E. R.

Ind., Roanoke, Huntington Co.—For over a month we had no rain until the 3d and 4th inst., and the weather was extremely hard ot dry. The corn and gardens were suffering, and will be soon again unless we have some more rain ere long. It is quite cool now. Corn promises to be a good crop, with favorable weather. Potatoes will be short—at least, that is the present outlook. Ten days ago they were selling for from 20c. to 25c. per bushel; now they bring from 30c. to 40c. New wheat is selling for from 90c. to 95c.; oats, 18c. to 22c. Wheat was above the average both in quantity and quality, and new oats are very good, too, here. The apple crop will not be heavy, though summer apples are very low now. Our Blount corn is very large and nice, from 10 to 12 feet high, nearly all in tassel, many stalks showing from three to six ears, with some also on the suckers, some of which are almost as large as the main stalks, though there are often two or three of them to a stalk. My wife's Voorhis watermelons are growing finely. She planted the flower seeds in a hot-bed, but most of them failed to germinate. The Yucca, Mulberry and Hibiscus were total failures. The E. Leavenworthii alone is thrifty. The Golden Rural tomato ripened for her ten days ago. We have had so much dry weather that she is inclined to attribute the failure of the seeds to it. A. C. H.

Ill., Edwardsville, Madison Co., Aug. 11.—I planted in spring Beauty of Hebron, Extra Early Vermont and Early Rose potatoes on the same day, in the same field. Beauty of Hebron came up two weeks ahead of the others, and kept that start until mature. All who saw them were surprised. The yield of the Beauty, too, was about one-third greater than that of the others, while the tubers were larger and of better quality. C. P. B.

Ill., Wheaton, Du Page Co, Aug. 6.—We have heavy crops of wheat and oats, mostly in the shock. The month of July did wonders for the corn, and it is now very promising. Potatoes are good, but I think not a heavy crop. Up to last Sabbath it had been very dry for some weeks, but then we had a fine rain and some large hailstones. No damage was done, however. O. F. L.

Mich., Plymouth, Wayne Co., Aug. 12.—My Blount corn is doing splendidly. It was planted on the 14th of May and now it has stalks 5½ inches around and from seven to nine feet high, with from three to four ears on a stalk. I think Pearl Millet an excellent fodder plant.

H. C. W.

Iowa, Bryant, Clinton Co., Aug. 8.—Farmers are just finishing up harvest operations. Crops generally are good and have been secured in fair condition except some of the earlier-cut hay which was lost owing to wet weather.

Arkansas, Van Buren, Crawford Co., Aug. 4.—Last year I obtained about two quarts of Beauty of Hebron potatoes and gave them to a tenant of mine, and the way he bragged about them was a caution. In July I dug a hill and the yield was remarkable; as my tenant expressed it: "they were three stories high" and literally pushing out the soil. Last spring I planted a few in my garden, but the ground having been too well supplied with green manure, they burnt up before maturing in June. Still I regard that variety as being most remarkable for its abundant yield. L. C. W.

Ky., Smith's Grove, Warren Co., Aug. 5.—Crops hereabouts are, on the whole, very short; corn is from one to two bushels per acre below the average, while wheat has averaged only from half to two-thirds of a crop. There isn't a full crop of anything. J. W. L.

Tenn, Tullahoma, Coffee Co, Aug. 4, 1879.—We are having fine growing weather; it rains about every day. Although dry weather prevailed for weeks, and crop prospects became very discouraging, yet we shall make fine crops of corn. My Blount Prolific corn was nearly ruined for want of rain; it has two and three silks to the stalk. My Hebron Potatoes excelled my hopes; and my Acme tomatoes are doing finely; we have plenty of ripe ones. I should have mentioned the Pearl Millet first; it surpasses anything of the kind I ever saw. It is heading, at about seven feet high; the heads are 12 and 14 inches in length, and if it is as good for stock as it is for fodder it will be invaluable J. M. G.

Va., Worsham, Prince Edward Co., July 31.—The Beauty of Hebron potatoes sent me by the RURAL, ripened about the same time as the Early Rose, and made larger tubers, but both were very much injured by drought. The Blount's corn has also suffered very much from the same cause, though I hope to make enough to plant several acres of it next year.

G. A. B.

Texas, Dayton, Liberty Co., Aug. 9.—No rain for over a month, and all growing things

are suffering accordingly. The squares on our cotton are dropping off as fast as they are formed. Even if the cotton worm does not come, we shall only make half a crop. The weather is cooler than last month, making it pleasanter for fodder pulling, which is now in progress. My second planting of "Blount's Prollfic" is a sad failure, owing to the drought.

G. G.

The Querist.

ANSWERS TO CORRESPONDENTS

Copyright.

J. H., Olathe, Kan., asks for some information on the subject of copyright.

ANS.—Copyright is a right conferred by law upon an author or his representative to the exclusive sale or use of his intellectual productions. It is only within comparatively recent times that the result of a man's intellectual labors have been regarded as his property; the term having been previously applied solely to material objects. The first copyright act in England, which secured to authors the right of property in their works, was passed in Queen Anne's reign, in 1709. In this country laws were passed by Connecticut and Massachusetts, in 1783, securing to authors for specified periods, the exclusive property in their literary productions, and prescribing penalties for its violation. Similar laws were passed by Virginia in 1785, by New York in 1786 and by other States prior to the adoption of the Federal Constitution in 1789. At present the authority over the whole subject rests in Congress. The first law on the matter passed by that body was in 1790. The Act then passed was amended or altered in 1802, 1831, 1856 and 1865. All statutes relating to copyright, however, were repealed by the general law of 1870, which, with an amendment passed in 1874, regulates the entire subject. The laws now in force grant to any citizen or resident in the United States, who shall be the author, inventor, designer, or proprietor of any book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph or negative thereof, or of a painting, drawing, chromo, statue, or statuary, or of models or designs intended to be perfected as works of fine art, the right to secure a copyright for 28 years from the time of recording the title. They also gave the right to a renewal for himself, widow, or children for 14 years more, and authors may reserve the right to dramatize and translate their own works. In order to secure a copyright every applicant is required to perform three acts:—1st, before publication, to transmit to the librarian of Congress at Washington a printed copy of the title of the book or other article, or a description of the painting, etc.; 2d, within ten days after publication to send to the same office two copies of the book, etc., or, in case of a painting, etc., a photograph must be sent. 3d. Notice for entry for copyright by the librarian must be stated in each book, or on each other article, and a failure to do this will preclude any action for infringement, while the publication of entry not actually made subjects the party to a penalty of $100. Two copies of any new edition must be also sent to the librarian under a penalty of $25 for failing to do so. The fee for securing a copyright is 50 cents, to be paid to the librarian for recording the title, and a copy of such record can be obtained for another half dollar. The librarian also receives $1 for recording and certifying any assignment, and $1 for every copy of an assignment furnished. It is also essential that the work should be original and first published in the United States, but a contemporaneous publication abroad will not prejudice the author's rights. The penalty for infringement of the copyright of a work is a forfeiture of every copy of the work printed, imported, etc., and the payment of such damages as may be recovered in a civil action. In the case of maps, engravings, etc., there is a forfeiture of the plates, sheets, etc., and $1 for every sheet in possession of the guilty party. Ornamental and useful designs come within the scope of the patent laws. A brief article on a single sheet may be copyrighted as a book. Encyclopedias, magazines, reviews and periodicals are protected the same as books. In practice newspapers are not copyrighted, but either the entire newspaper or any article in it may be copyrighted in the usual way. Extracts made from copyrighted books or periodicals duly credited, are always held to be legitimate exceptions to pirating. The laws of this country recognize no international copyright. No immoral publication can be protected by copyright. By the term a "resident" in this country, is meant a person who, at the time of securing a copyright, honestly intended to become a citizen of the United States. Should the *bona-fide* nature of the intention be legally questioned, the matter must be decided by the verdict of a jury.

The Most Instructive Reading for a Farmer.

T. D. B., Greenville, Ky., has about 10 acres of poor land on a railroad where manure can be bought for two dollars per two-horse load, delivered; he is hard-pressed on account of having been crippled by rheumatism for a number of years, and he asks what works on gardening and manures would it be advisable for him to buy, if he can manage to save the price of them.

ANS.—We would be very glad to aid this person or all such persons. Well-to-do or wealthy farmers or gardeners really stand less in need of trustworthy advice than those who, like our friend, are obliged to struggle hard for life's needs. Wealthy people can afford to try experiments and to make mistakes. But poor people are discouraged and crippled by failures. There is no one book that will give him all desired information. Having but a few dollars to invest in this way, we advise him to read the best agricultural and horticultural papers of the day rather than books which record the best methods of the past. Such papers record all important failures and successes of the current season; they tell what seeds and plants are improvements over older sorts—so that volumes for the year are really the most complete compendium of general information that can be procured. We would guard our questioner against investing in new plants or seeds. These are sold at high prices and are too often praised by agricultural papers far beyond their merits. But there are hundreds to test such novelties, the result of which is that the good and worthless are in course of a season or so easily determined. This is the main object of the Rural's Experiment Grounds. We purchase or have sent to us all new plants of any promise and test them. Then we report as to their real worth without the least regard to the interests of the introducers. But all the books and periodicals published will not make poor land rich. Our friend *must* use manure if he would raise paying crops.

Learning Telegraphy at Home.

H. S., Ashland, N. Y.—being anxious to learn telegraphy and unable to attend a place where it is taught, asks whether it can be learnt at home.

ANS.—Telegraphy can be learned at home provided one can receive instruction of a skilled operator, otherwise not—at any rate, not well enough to enable one to take charge of a wire. There are two things to be learnt in telegraphy: to send a message and to receive one. In sending a message the hand is the main agent, but to receive it the ear alone is employed, as nearly all instruments now in use record the message by sound and not by marks on paper. The alphabet, consisting of dots and dashes, is delivered by the instrument as a succession of more or less rapid taps, and to learn to distinguish the letters by these sounds, the learner must listen to them from a skilled operator in order to get them correctly. It also requires a fine ear. None but those who have a good ear for music should attempt to learn telegraphy. When the alphabet is once learned one can practice at home. But to do even this to any advantage, there must be two persons interested in the matter, each having an instrument and a battery set up in different parts of the house and the two connected with a wire. Thus equipped, and with the necessary primary instruction, there is no objection to pursuing the study at home. Our correspondent can obtain all required information from Smith's Manual of Telegraphy, which can be had through this office or by addressing L. G. Tillitson & Co., Nos. 5 and 7 Dye St., N. Y., price 30 cents. Two instruments and two batteries will cost $9, and will be furnished by the same firm.

Treatment of Blood Warts, etc.

W. M. S., Jordan, N. Y., has a two-year-old mule that has two blood warts, one of which has grown to be quite a tumor, and, 1, he asks what will remove them without injuring the mule; 2, he also wants to know what ails a horse that pants a great deal and does not sweat on a hot day.

ANS.—1, A blood wart may be a dangerous thing to meddle with. If it is an aneurism, or dilatation of an artery, nothing but compression should be used, unless astringent washes, such as infusion of oak bark, or galls, or solution of sugar of lead, be used to encourage the effect of the compress. As it is not stated in what part of the body the so-called warts exist, particular instructions cannot be given. If the warts are simply bleeding warts of the ordinary kind, caustic applications, such as solution of nitrate of silver (20 grains to the ounce of water) or a stronger solution of sulphate of copper, or even hydrochloric acid reduced one-half with soft water, may be applied to surfaces. 2, The difficulty of breathing may be caused by disease of the heart, in which case no treatment can be indicated. If it results from an abnormal condition of the skin, sudorifics should be given—for instance, four ounces of sulphur daily; or two ounces of sweet spirits of niter; or one ounce of acetate of potassa, either being given daily and continued for 10 days or longer, or until the skin acts. The skin should be well brushed three times a day; this will greatly help to restore activity in it.

Planting Strawberries.

R. A. C., Steuben Co., N. J., desires to know (1) when is the best time to set out Strawberries, spring or fall, (2) what are the best varieties to try, (3) the price, (4) how to plant, etc.

ANS.—All things considered, spring is the best time; but if pot grown berries be planted from now until the middle of September, a fair crop may be anticipated for next summer; a good deal, however, depends upon whether they are properly grown in pots. Unless the soil adheres, very little is gained by setting "pot-grown" plants. 2. Charles Downing, Triumph of Cumberland, Sharpless, Champion, Kentucky (for late), Prouty's Seedling. 3. From 50 to 75 cents per dozen. 4. Dig the soil a foot in depth, and work in any well-rotted manure at hand; bone flour and ashes are good. Set the plants one foot apart in rows, the rows 18 inches apart. This for garden culture. We would take this occasion to say that the establishments which advertise small fruits in our advertising columns, furnish catalogues which give all instructions in detail. These details we have published over and over again, so that it is not desirable to repeat them whenever inquiries are made. The catalogues or pamphlets will be mailed free to all applicants.

Potash from Wood Ashes.

G. S. D., LeSeur, Minn., intending to make potash from wood ashes, asks how much will two iron kettles cost, capable of holding two barrels each; how many pounds of potash will 100 barrels of hard-wood ashes yield; what is the present price of potash, by the barrel, in New York.

ANS.—Cast-iron kettles can be procured for about three cents per pound. A 70-gallon kettle for boiling potash should weigh about 600 or 700 pounds. The yield of the ashes depends altogether upon the kinds of wood, and also upon the soil on which the timber grew. Elm from rocky land yields the largest proportion of potash of any wood; but swamp elm gives no more potash than some pine. Bird's-eye maple or yellow birch from rocky land, with elm intermingled, might yield from one to two barrels of potash to the 100 barrels of ash. If the timber is mainly oak, beech, soft maple, white birch, or such as grows on low vegetable soil, the yield of potash will be very light, perhaps not half a barrel to the hundred barrels of ashes. It all depends on the timber. Crude potash is worth in the New York market 7½ cents a pound.

Points of Light Brahmas.

F. M. C., Kiddville, Mich., asks what are the points of Light Brahmas, as regards plumage.

ANS.—The points are briefly these: The feathers are prevailingly white, except those of the tail and the flight feathers at the extremities of the wings. The hackle, or feathers of the neck, are each tipped with black, forming a sort of arrow-head penciling, which should be very bright and clear. The exterior of the "fluff," or the downy feathers which cover much of the body, must be pure white, but within it may be smoky. The yellow legs must be feathered to the toes, that is to the end of the outside, and, if possible, of the middle toes. The feathers need not be perfectly white, but no other colored feathers but white and black (or gray on the legs) are admissible. Yellow on the cock is bad, and brown or gray on the back, or dark feathers anywhere, except where stated, are inadmissible in show coops.

Miscellaneous.

M. M. D., West Newton, Pa., sends a plant found on his pasture field, the like of which he never saw before, and asks its name.

ANS.—Leucanthemum vulgare—Dalsey, Ox-eye Daisy, White-weed. It is rather singular that our inquirer has never noticed this weed before. It is a pest all over the country, and it is not uncommon in June and July to see fields quite white with its flowers. It is a perennial herb. Each flower bears a great number of seeds (Akenes), hence its rapid spread. It is a native of Europe. A very effectual method of getting rid of it is by plowing about the 1st of July. Most of the flowers are then blooming. These are turned under before the seeds are ripe, while the roots are killed by exposure to the hot sun. Treated in this way, as a fallow manure they are also of some value. The land may then be sown to turnips or buckwheat, or kept bare until September and then prepared for wheat.

F. C., Freedom, Pa., asks, 1st, what is the prospect for prices of apples this year? 2nd, whether the Fallawater is a good, reliable apple as far as its keeping qualities are concerned? It sells well in Pittsburg, in spring.

ANS.—As indicated by our Special Reports, throughout the season, the apple crop will, in the aggregate, be considerably short this year; but here and there the yield is reported to be abundant. The prospect is, therefore, that prices, on the whole, will be higher than last year, though in some places the supply being large, the prices will be low. An excellent way to ascertain the outlook for any crop, is to study the reports from different parts of the country as they appear weekly in our columns. 2d. The Fallawater is essentially a market apple, having little to recommend it but its size, appearance and productiveness. It is a native of Pennsylvania, where it is a great favorite. Its keeping qualities are good; its season November and December, according to Warder; November to February, according to Downing.

B. O. Aikin, S. C., asks how long do mosquitos live, and whether it is true that one kind bites in the day time only and another at night.

ANS.—It takes about three weeks from the time when the egg is deposited by the female until the perfect insect is developed, and then the latter's life is but of short duration, seldom lasting more than a couple of weeks at the outside, and often only as many days. A large mosquito, however, with two light spots on each wing, which is abundant and bites very fiercely in spring, is supposed to hibernate in houses. Some species are active by day, and others by night, while some are busy at either time. The day blood-suckers are found principally in marshes and damp woods and rarely in houses, and are of more brilliant colors than the nocturnal species. The female alone bites, the male passing a harmless life among flowers or in the woods and marshes, and dying early.

M. A. C., Attica, Mich., sends us samples of five sorts of winter wheat grown by him, namely: Imported Hungarian Amber, Gold Medal, Diehl, Clawson and Michigan Wick, and asks what we think of them.

ANS.—We do not know anything about Hungarian Amber. The others are excellent sorts, Clawson on the generality of soils, will yield the heaviest crops. "Wick" will make the best flour, judging from that raised at the Rural Farm. In fact, we have never raised a wheat that makes handsomer bread. Why call this "Michigan?" We would be glad to get the history of Wick, or, as it is sometimes written "Wycke."

H. R. C., Perry, Ill., asks whether a bushel of barley is worth as much for feed as one of corn.

ANS.—A bushel of barley is only 48 pounds, and is generally short of that weight; while a bushel of corn is 56 in nearly all the States, and generally overruns, so that it would require seven bushels of barley to equal in weight six bushels of corn. We do not know of any experiments as to the relative nutritive value of the two grains. A little barley meal mixed with corn meal for pigs, is, however, thought by many farmers to make more and better pork than corn alone.

H. J. B., Amsterdam, N. Y., asks, where can he get roots of the Cuthbert Raspberry. With him the Acme tomato has ripened before the Golden Rural.

ANS.—Our friend is requested to wait two or three weeks. The reason for this request will then be apparent. We are glad to receive reports alike whether favorable or unfavorable to the seeds we have distributed. We desire to disseminate only improved varieties. We have pulled, up to this date, 10 Golden Rurals to one Acme.

W. H., Webb's Ford, N. C., asks how many pounds in a bushel of shelled corn.

ANS.—In New York 58 pounds are a bushel of shelled corn; in California and Nevada, 52 pounds; in all the other States, 56 pounds; in Canada and England, 60 pounds. In a large part of New York, however, where farmers sell corn by the bushel, custom demands 60 pounds.

L. C. W., Van Buren, Ark., referring to the variety of Doura described in "Notes from the Rural Farm," in our issue of August 2d, asks, what variety is it that tillers so remarkably, and, when cut off, at once continues to grow as if it suffered no check in consequence.

ANS.—Sorghum cernuum. We shall give notes of our tests as soon as the crop matures.

J. P., Raysville, Ind., sends us a note dated August 1, but post-marked August 5, asking whether he is too late in enrolling himself among the competitors for the corn premiums.

ANS.—We regret to say that Aug. 1, was the limit to the entries.

F. H. D., Corning, N. Y., sends leaves of a vine for name.

ANS.—As well as we can tell from a leaf only, this is Amphicarpæa monoica—Pea vine—Hog Peanut. Please send us a flower and leaf.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, AUG. 16th.

H. L. W., Thanks.—W. I. C.—J. R. K.—J. S.—L. R.—H. S.—A. A. B.—E. W.—C. W. G.—N. S.—W. B. D.—C. M. C.—E. W. B.—W. C. G.—M. B. B.—E. E. B. S.—E. G., Thanks.—J. M. B.—J. K.—T. T. M.—M. N. B.—A. C. THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York City.

SATURDAY, AUG. 23, 1879.

TO WHOM IT MAY CONCERN.

INSTEAD of 50,000 extra numbers of the RURAL NEW-YORKER, as heretofore stated, we now *guarantee* an extra issue of 60,000 for our Fair number. It will be made up of 28 pages, including the cover. Many original engravings and articles from the following writers are either received or promised: Dr. J. B. Lawes, of Rothamsted, Eng.; Professor J. P. Sheldon, of Cirencester, Eng.; Professors I. P. Roberts and G. C. Caldwell, James Taplin, Henry Stewart, Pres. T. T. Lyon, M. B. Bateham, M. B. Prince, M. C. Weld, Professor L. B. Arnold, W. I. Chamberlain, J. B. Armstrong, William Falconer, J. T. Lovett, Col. F. D. Curtis, S. Parsons and others.

We may also state that our next Free Seed Distribution will be fully and definitely announced. In reply to many inquiries, it may be said that our rates for advertising in the Fair Number will be the same as in any other number. Advertising copy must be received prior to the 25th inst.

We again invite agents, secretaries and our readers to send for as many copies as they may be willing to distribute or to hand to their friends. They will be promptly forwarded free of charge.

THE LESSONS OF ADVERSITY.

THE lessons of adversity are many and various, physical, intellectual, agricultural, financial, political, moral. Adversity comes usually, we believe, in consequence of our violation of some great law of our being or of the world in which we live; and is doubtless intended by a Wise Providence both as a check and a warning. Physical pain, for example, has most beneficent results. Unconsiously our foot, or hand, or face, or whole body is exposed to too great heat, or too great cold, and acute pain tells us of the fact, and warns us to protect ourselves. But for the pain, hand or foot or body might be maimed or destroyed by fire or frost or accident.

Disease, too, often has a similar mission, and its lessons should be carefully studied and promptly acted upon. Typhoid fever warns us that we are breathing tainted air or drinking poisoned water or both, and bids us promptly change our course in these respects. Ague often bids a country household look well to its slop drains, pig-sties, barnyards, cesspools, garbage, and the general cleanliness of its surroundings. Or it bids a whole community look to the drainage of its swamps, or the destruction of the mill dam that floods acres of ground and fills the air with the miasma of decaying vegetable matter. Even so trifling an inconvenience as the sudden and unexpected sneeze or tickling of the throat, warns you to remove from the refreshing draft of air that cools your heated brow. Yellow fever has its lessons, too, more intricate and hard to trace, but on that very account to be studied the more diligently and persistently. One lesson, doubtless, is the necessity of greater cleanliness in our towns and cities. It may prove the great besom which the Almighty holds up before our City Fathers, and says, "Sweep well your streets and cleanse your sewers, or your city shall be swept with this besom of destruction." A most intelligent physician from Memphis said to us years ago "Memphis ought to have yellow fever. Her great bayou floods from the river in high water, doesn't drain back at low water, receives the sewage of the city, and in dry hot times becomes a vile and stagnant pool to breed disease and pestilence." The ultimate causes of the fever may be more remote and intricate and hard to find. They require and are receiving the careful study of competent medical and scientific men. But this that we have given seems so obviously one cause at least of its spread and virulence, that "he that runs may read." Truly the old divine spoke not so far amiss when he said, "Cleanliness and Godliness are near of kin."

The student, the teacher, the professional man and the man of business are often warned by intellectual adversity that they are violating some law of the intellect. The free horse that will not brook the whip, and seems never to tire, finally becomes sluggish, minds not even the lash, and perspires inordinately under moderate driving. If his owner has sense he knows the steed has been overworked, or is ill and needs rest, care, and possibly treatment. So the eager mind, when it becomes dull, dreads the task it once delighted in, or tosses the body by night with restless nervousness, or makes it start from uneasy sleep, tortured with horrid dreams, shows plainly that it needs rest, change, recuperation, or the correction of some violation of physical as well as mental law. Happy are we if we heed the warning before nervous prostration or even insanity follows.

Financial stringency or panic oftentimes checks a community or country in a career of reckless extravagance or wild speculation, in time to avert impending financial ruin. Political defeat makes a great party look well to its principles, and find wherein it has swerved from those great laws of practical righteousness and justice and financial honesty on which a free government must always rest.

So too in the field of morals, which belongs rather to the pulpit and the religious press, it may be shown that "whatsoever a man soweth that shall he also reap." That disaster and affliction come in accordance with natural or moral laws, or for their violation, but that they are none the less sent by a Wise Providence for our good, as a warning and a guide. Here is a Christian man so intent upon his business schemes that he neglects the proper training of his children. One child dies by disease, indeed, and in the natural course of things. But the father's heart clings to those that remain, and he sees the folly of undue absorption in business to the neglect of proper care for what is far more precious. Or financial reverse warns him not to make wealth his god lest he find the love of money the root of all evil.

But the point we had in mind as more specially adapted to these columns, was the lessons of adversity in agriculture. The space already occupied, however, warns us that this must be reserved for consideration at another time.

WHEN TO SELL.

Every one who is engaged in any department of agriculture or manufacture is supposed to have from time to time something to sell or exchange. On the disposition of this surplus depends the supply of all articles that the person does not raise, embracing all implements and improvements of every kind that require an outlay. Hence it is a matter of moment that the sale of these things be made at the time that the best price, all considered, will be obtained. Is it possible to be certain of this time? In general, no. There are many articles that constitute exceptions. Those that cannot be conveniently preserved, must, of course, be thrown on the market at once. Others that are in demand in certain seasons only, will be governed by the season trade. But the most common and valuable products of human industry are always in market, and yet are subject to frequent fluctuations in price. Such are the leading products of the farm and most of the useful manufactures. As to these no fixed rule can be given, but the following suggestions will commend themselves to the prudent.

One should keep himself informed of the state of the market, especially in places accessible to him, and as far as practicable in places whose trade affects directly his local market. The best way to secure this, is to take and read good papers, that give not only the tabular market statements, but also intelligent and impartial comments and counsels. When necessity compels one to sell, he can only submit, regardless of prices; but in all other cases, he ought to govern himself consistently by reasonable probabilities. Unless in the face of a comparative certainty that there will be no advance, economy plainly forbids the disposal of a commodity at a price that is not more than its cost to the producer. Business cannot live on losses. A certain farmer who always prospered made it a rule to sell everything he could spare as soon as it was in marketable condition. He never made much at one time, but he avoided all risks of rogues and fires, all injuries by vermin and weather, all the trouble and expense of protracted storage, all the reduction of shrinkage and incidental waste; and he was receiving money now and then, through the year.

It is safe advice to say that every one should be content to sell at a reasonable profit. To wait for very large prices is dangerous policy, and, especially as to the necessaries of life, very bad morals. What man *must* have, his fellow-man should be willing to furnish at rates that are not exorbitant or oppressive. Business should never violate the principles of magnanimity and true charity.

CARELESSNESS AS A SOURCE OF INCOME.

It is amazing to consider the extent to which losses are incurred on the one hand, and sales and occupation afforded, on the other hand, by the inexcusable carelessness of people who know better and ought to do better. The fastening of a well-bucket is deranged, or a hoop is loose, but the thoughtless man or woman never notices the trouble until the bucket is dropped in the well or the bottom is out. Then time is lost, the family is inconvenienced, and perhaps a neighbor gets a job of work and the pay. The gate-latch is out of order; no attention is paid to it; the hogs or cows get in; the yard is rooted up; the shrubbery is destroyed; the gardener is employed, and the nurseryman has an order. A tire is loose on the wheel; the wood is swiftly wearing away, a little care would set the matter right; no pains are taken; away on the road a wheel is crushed, and the wheelwright has some employment. A shingle is out of place on the roof; one nail would mend the trouble; that nail isn't driven; the rain steals in, and soon the plasterer is paid to use trowel and brush. A bridle rein is weak; a bit is worn; nobody thinks of examining either; a horse is drawn to one side, or a horse runs away; a vehicle is broken; a carriage-maker or blacksmith is profited, and perhaps a surgeon has a profitable professional engagement.

The water of a well is impure; those who use it complain, no proper steps are taken; the family have serious sickness; the druggist sells his medicines, and the doctor gets his fees. In the same way the cellar is foul; the mephitic gases escape through the floors; the blood is poisoned; the fever rages, some suffer; some die; the physician has a harvest, and even the undertaker and sexton find employment. A stove-chimney is in dangerous condition; people have eyes to see, but don't use them; the fire soon does its dreadful work, and carpenters and merchants have a good time. So of many—very many things.

Are you innocent of such neglect? There are far better and cheaper ways to give work and profit to others. By taking care of what you have, you may become able to add other and more valuable things which you desire. There is true economy in proper attention to small as well as great things.

THE OUTLOOK FOR PRICES OF GRAIN.

Despite the short crops of some parts of Europe, the prospects for a speedy rise in the price of American grain are not very encouraging. Of late the importations into England have been exceedingly heavy, so that in face of the short domestic harvest, prices rule low. Usually when crops are short there, farmers are partly compensated by high prices, but this year is an exception to the rule. According to the best estimates, France will require $125,000,000 worth of foreign cereals, but a large proportion of this will be supplied from Southern Russia and the Lower Danube, where, as heretofore stated, the grain crops have been very abundant this year. Never before, according to yesterday's cablegram, was so large a quantity of wheat stored at Odessa, and there are, it is said, but few buyers. The actual supply does not seem too great for the prospective demand, but too much of it is being thrown upon the market at this season. Later on, it is not improbable, that prices will go up considerably. The present outlook is, that we shall have a surplus of upwards of 150,000,000 bushels of wheat for exportation, while six countries in Europe will need about 300,000,000 bushels. Of this, not much over 100,000,000 bushels can be supplied from other European sources. Northern Africa will hardly be able to furnish enough for its own needs; the trade in cereals with India is still in its infancy, though capable of vast development. The same may yet be said of the supply of wheat from Australia and New Zealand, while the war now raging between Peru and Chili will check cereal exports from Valparaiso. The supply from all these sources cannot, therefore, be over, say, 30,000,000 bushels, which will leave a good market for all we can spare.

BLOUNT'S CORN—WHAT WILL THE HARVEST BE? HIGH HOPES.

A few weeks ago Blount's White Prolific Corn was reported in our Everywhere Department as from ten to fifteen feet high, and yet no silk or sets had appeared. Our own plots and those of neighboring farmers, who had received the packages we sent them, corroborated those reports, and we began to feel that our "Free Distribution" in so far as the corn was concerned, would result in little benefit to ourselves or friends. We may now state that the promised yield is something wonderful, and we do not doubt that the country in general and even Professor Blount himself will be surprised at the yield of those plots which draw the RURAL premiums.

BREVITIES.

"RAIN, rain, rain." Such is our brief note from the Rural Grounds.

REMEMBER that wood ashes are, perhaps, the very best fertilizer for strawberries and bone-flour, or superphosphate next.

AMONG hardy perennials there are few handsomer flowers at this season than those of Campanula grandiflora.

WE have Tomato vines on trellis seven feet high. For the home garden, this is a very attractive and satisfactory way of treating the tomato plant.

THE well-known horticulturist, Dr. F. M. Hexamer, writes us: "The advertisement in the RURAL NEW-YORKER has brought me more orders than I received from the same advertisement in any other weekly paper."

PROF. RILEY, will Weevil-eaten peas grow as well as others? Now, answer us please. You know those who have the promotion of scientific or any other truths at heart always hasten to "own up" when they have gone astray.

TREE peddlers in Kansas are selling Rose bushes, which are guaranteed to bear blue flowers. We are surprised they do not talk about red, white *and* blue roses; the blue one is old! That would be an "American Banner," indeed.

THE Times and Journal, of Bricksburg, New Jersey, says: "It is the opinion of an old potato grower that the seed potato, the 'Beauty of Hebron,' furnished us by the RURAL NEW-YORKER, came up quicker, grew faster, and matured earlier than any Murphy on record."

THE editor of the Gardeners' Monthly, joins the editor of the Country Gentleman in advising that the old stems of Raspberries and Blackberries be left until fall—but for a different reason. He thinks the partial shade the old stems make, seems rather beneficial than otherwise under our hot suns.

THOSE who desire to know as to the value of Pearl Millet, Beauty of Hebron potato, Blount's Corn, Golden Rural Tomato and the other seeds of our last Free Seed Distribution, should read from beginning to end our "Everywhere" Department. Aside from crop reports, however, it is one of the most entertaining and instructive parts of the paper. So say many readers.

JUDGING from the letters and circulars and bills and catalogues and tickets we are receiving from the secretaries of fairs, all over the country, more energy and interest are being manifested than usual in Agricultural Fairs. We hope this interest may be maintained by a greater attendance than usual, and with more benefit to the agricultural and horticultural community.

CALIFORNIA is going to have a Horticultural Society. One would think, if such societies are useful anywhere, they would be indispensable in that State of balmy air, fruits and flowers. We learn the above from our contemporary, the California Horticulturist, which, by the way is a very different magazine, under the editorship of Mr. Shinn, from what it was under that of his predecessor.

MR. BARRY in a note to us, or in an article which will appear next week—we forget which—refers to the Honeywell Peach as of poor quality. Trees of this were sent to us two or three years ago by Messrs. A. Hance & Sons, to be tried. They fruit this year. They were the first to ripen of any of our peaches, but most of them rotted on the tree, and those that ripened were as nearly devoid of peach flavor as any we have ever eaten.

MR. A. B. CRANDALL, says in the New York Tribune: "That there was no horse-racing at the recent great show of the Royal Agricultural Society of England was not for lack of room, as the 105 acres of "Kilburn pasture" inclosed could easily have afforded ample space for the track deemed so indispensable at most fairs in America." It is a notable fact that at the best agricultural show of England and the best of the United States horse-racing is not permitted.

CORRECTION.—In our issue of August 9th, a summary of our tests as to whether weevil-eaten peas would grow was presented. In the last line of Test No. 4, the word "more" should have been NONE—as follows:

TEST NO. 4.—On the same date as above, twenty-five weevil-eaten peas were planted two-and-a-half inches deep. They had been soaked, as in the above test, for six hours. They were not artificially watered afterwards. None appeared above ground.

OBJECTION has with justice been made to the Chinese Magnolias, that they bloom in spring before the leaves expand. Tropical-looking flowers and bare twigs and chilly winds of April are not in keeping. One pities the flowers, because they look cold and lonely. Magnolia Lennei, however, though it bloomed profusely in early spring, is now blooming again. The large, purple flowers are very pleasing among the rich, heavy leaves. From the spring flowers, many cones of fruit formed so that the tree is in fruit and flower simultaneously. Perhaps if we were to cut out the buds which form a little later to bloom next spring, it would bloom more profusely, in August, and thus after several years, perhaps, be changed from a spring to a late-summer-blooming Magnolia. Of all our Magnolias this pleases us most.

Literary Miscellany.

UNDER THE GUNS.

UNDER the guns of the fort on the hill
Daisies are blossoming, buttercups fill;
Up the gray ramparts the scaling vine flings
High its green ladders and falters and clings
Under the guns,
Under the guns,
Under the guns of the fort on the hill.

Under the guns of the fort on the hill,
Once shook the earth with the cannonade's thrill,
Once trod these buttercups, feet that, now still,
Lie all at rest in their trench by the mill
Under the guns,
Under the guns,
Under the guns of the fort on the hill.

Under the guns of the fort on the hill,
Equal the rain falls on good and on ill,
Soft lies the sunshine, still the brook runs,
Still toils the husbandman—under the guns,
Under the guns,
Under the guns,
Under the guns of the fort on the hill.

Under the guns of Thy fort on the hill,
Lord! in Thy mercy we wait on Thy will;
Lord, is it war that Thy wisdom best knows,
Lord, is it peace, that Thy goodness still shows
Under the guns,
Under the guns,
Under the guns of Thy fort on the hill.

[*Bret Harte in London Society.*

THE SCANDALOUS LETTER.

[Complete in Ten Chapters.]

CHAPTER VII.

Nelson had been flattening his nose against the parlor window all the afternoon, and stretching his neck in vain efforts to look up the dismal little rain-blurred street, but no sign could he see of Dr. Yorke, whose usual hour for calling upon Miss Carew had long passed by.

"I wonder what can be delaying the Doctor?" he sighed for the hundredth time. "He has not been here now for three days."

"Perhaps he is very busy, darling. We shall see him to-morrow, I dare say."

Nelson sighed again disconsolately. Olive was working hastily at her costume for the evening's performance—altering ribbons and laces, trying to make an old dress look like a new one. She laid it down as she noticed the boy's listless air, and said cheerfully——

"Will you play for me, dear? It will make my needle fly twice as fast."

Nelson limped over to the piano at once, and soon the room thrilled with the pathetic tones he coaxed out of the well-worn instrument, while her needle flew in and out of the silk. Tears were falling as she sewed, and wetting her thread with big drops. The world—her life—seemed very dark to her just then. She had done what she had felt to be right, but it was hard, try as bravely as she could, to help doubting and longing and regretting. And since the miserable night when she had said good-bye to Jack Dacre she had been so lonely. The poor fellow's words kept ringing so persistently in her ears. If Robert would only come, she thought despairingly as she stitched and stitched—if he would only come and help her to be strong and true! The tears were all wiped away, when presently Nelson grew tired—as he had so easily grown of late, his sister remembered, stung with a sudden cruel pang—and came limping over for Olive's smiles of thanks.

"Your music has done me so much good, my darling!" she said, dropping her work to clasp him to her breast and cover his little wan face with kisses. "But why do you stop so soon? You don't feel any worse to-night?"

"Only a little tired and drowsy," replied the boy, smiling faintly; and as he spoke he sat down at his sister's feet and laid his head upon her lap, still holding her hand between his two little wasted palms. "Olive, I shall be so glad when Dr. Yorke takes us home with him. You will never look anxious then, will you, dear?"

"Never," Olive answered huskily—"never, my dearest, if you will only grow strong and well."

The child turned his lips to the little hand he held, and kissed it fondly. There was a silence of some minutes, which was broken by the entrance of Mrs. Allen, in a rather floury condition, as to her hands and apron, who announced the Doctor, and, shutting the door upon two troubled hearts, went back to the cakes she was making for tea, unconscious of the tragedy going on in her modest parlor. Nelson had fallen asleep in the warmth of the fire, and Olive, putting her finger to her lip as she smiled at her lover, motioned to him to bring her the pillow from the sofa, and to help her to lay the boy's head gently down, and to cover him with a shawl.

"I have been watching for you so anxiously," she said then in a cautious whisper, and putting her two little trembling hands into the Doctor's. "It is very kind of you to come when you are so busy."

Dr. Yorke made no reply.

"I may finish my work, I suppose?" the girl continued nervously, "It's for to-night."

Tall, slender, pale, she looked more like a garden lily than ever as she stood before him in her black gown, her head drooping a little under its crown of chestnut braids. But there were traces of suffering round her sweet eyes and trembling lips which awoke a pathetic yearning in Robert Yorke's heart, and moved him to speak her name very gently as he drew her chair up for her and made her sit down. And as he did so, cold and impassive as he looked, Miss Carew's middle-aged lover was struggling with an impulse that bade him fall at her feet, and call upon her to declare that all the misery he had endured during the past few days was but a hideous dream, and that she was still as fair and pure and sweetly cold as she had ever seemed to him, as she then looked. But he recollected himself in time, and the impulse was mastered—recollected what he had read and seen, and what he had come to say to the beautiful disloyal woman who was to have been his wife. It was sometime before he spoke. The pleasure was too keen, in spite of his bitter resolutions, of gazing at the charming sensitive face before him, of following the delicate hands as they went rapidly and deftly to work, of breathing the same air with Olive Carew, for the Doctor to wish to break the silence; and Olive was too full of painful and conflicting thoughts to be able to speak.

During the past few days she had been trying to think very kindly of her grave plain lover. She had resolved to be to him a good and obedient wife, of whom he should have no cause to complain. She almost believed herself capable of forgiving the grim coarse woman who had lain in wait for her and insulted her, if it would only set matters on their old footing between herself and Dr. Yorke. But, now he was there, close at her side, touching her hand, speaking her name, every drop of blood in her young body turned cold; she could hardly repress a shudder, and she knew, once and for all, that she could never be happy with this man. She shrank a little away then, and took up her work.

"What is he going to say?" she wondered breathlessly, as she fastened the coquettish blue knots on her white stage-dress.

Dr. Yorke did not leave her long in suspense. With an effort taking his eyes from her sweet beauty, he straightened himself up, sighing.

"Olive," he said, "I have been very unhappy since I saw you last."

"Unhappy!" she echoed faintly, pricking her trembling fingers as she sewed.

"Have you nothing to tell me?" he continued earnestly. "What is this cloud that has come between us?"

"There is none of my making, Robert."

He sighed again, and starting to his feet, began to pace up and down the narrow room.

"You remember," he said then, coming back to her side, "that day in the garden—the day you gave yourself to me?"

"Yes."

"You remember the confession you made, that your heart had gone out of your keeping before ever we met?"

"I remember." The warm blood rose in her cheeks at the thought of it; he saw it and it did not make him the more patient.

"Olive," he cried with a sort of groan, "why had you not the courage to be true to yourself that day? Why did you promise me a fidelity, an esteem, which were out of your power to maintain?"

"Robert"—Miss Carew dropped her sewing—"take care what you say! You are looking at me through some one else's eyes. I will bear a good deal from you, but——" She gulped down a sob which would rise when she remembered what it had cost her to maintain the faith he was so ready to question. "You forget," she continued, "that I do not know yet of what I am suspected. All I know is that you have not been to see me for three days—why?"

"Do you ask me why?"

"I do. I hate mystifications, and I am talking quite in the dark, so I ask you again, What have I done? And what has my poor little dead-and-gone romance to do with your absence of the past few days?"

"Will you look me in the face and say that you have seen no one during those three days whom I should disapprove of your meeting?"

"I will assure you that I have not spoken one word, Robert, in those three days that I need have been ashamed of your hearing. I have been true to the promise I made you in the garden. What cause have I ever given you to think otherwise?" She spoke with the most patient sweetness, for she had resolved to bear with him, knowing that he was suffering.

But Dr. Yorke looked at her with a kind of wondering pain.

"Poor child," he said huskily, "I must not be hard on you, for you have had to struggle alone with the world at an age when other girls are safe in their mothers' arms. Perhaps the fault was mine. I might have known you could never care for me. But there is no need for any further concealment or deceit, my dear. I know your unhappy secret."

"You may think so, Robert," she answered with quivering lips, "and perhaps appearances are against me. But if I tell you that I have sacrificed everything in the world to keep faith with you, you will believe me? You will take my word before that of the—the persons who are misrepresenting me?" Olive waited breathlessly for the Doctor's answer.

With an exclamation of pain he passed his hand fiercely across his eyes.

"Your word!" he cried. "It is your own word I am taking. To whom else do you think I would listen for one moment?"

"My own word?" Olive looked bewildered and drew back a pace or two. "Robert, what does all this mean? I implore of you to speak plainly and have done with mysteries."

Robert did not speak, but he took from his pocket the stolen letter and put it into the hand which she extended mechanically to receive it. With her first glance at its contents an utter change flashed over her face. Every trace of color died out of her cheeks and lips; she turned and looked at the Doctor with eyes of passionate disdain.

"Where did you get this?" she asked, in quiet accents that seemed to cut the air with their keen edge.

"No matter," he muttered, a dark flush rising to his brow.

"Where did you get this?" she repeated, in precisely the same tone; and he told her.

Miss Carew burst into a peal of bitter laughter that woke the boy out of his sleep; he sat up, looking with drowsy bewildered eyes at the two agitated faces just visible in the dusk. His sister ran to him and lifted him up, straining him in a passionate embrace.

"It is on this letter you condemn me, Dr. Yorke?" she cried. "I congratulate you on the honorable means you have taken to prove the character of the woman who was to have been your wife. You did not think me worthy then of one kindly doubt? You take it for granted that I am bad—deceitful—false?"

"What else am I to think? Good Heavens, Olive, am I a stock, a stone, that I am to bear such things as these and hold my tongue?"

"No; you are right," Miss Carew said bitterly. "Further concealment is unnecessary. I did write this letter, and I admit, Dr. Yorke, that after what has happened to-day Olive Carew can never be your wife."

"Olive," Nelson cried fondly, winding his arms round her, "who has been cruel to you? Come away, dear! No one shall hurt you!"

"No, darling," the girl answered, with a shower of kisses on his wan cheeks—"no one shall hurt me after to-day. You and I will go away together."

The Doctor stood in speechless misery, more conscious than ever of the pale woman's beauty, as she flashed defiance out of her dark eyes and towered superbly above him. Then he called to her hoarsely, extending his arms.

"Olive! Have you no excuse—no explanation to offer? Must I lose you for ever because you will not speak?"

Olive drew back, with a magnificent gesture of dismissal.

"I decline to offer either excuse or explanation," she returned, still holding Nelson within her arm. "I acknowledge that I am guilty of all this letter implies. There is nothing more to be said but that you and I have done with each other from to-day!"

"That is your last word to me?"

"That is my last word."

Robert Yorke crossed the room like a man in a dream—the room where he had been so happy and so miserable, the room he would never enter again. He turned when he reached the door to look at Olive, standing in her long dusky gown, with the child still clinging to her. The letter lay on the floor, a patch of white in the firelit gloom. He heard the rain, and the swish of the willow-boughs against the panes; a clock struck the hour. Mechanically he counted the seven ringing strokes as he stood grasping the door-handle, and thought, in a dull, stupid way, that he would be late for dinner and had better be going. Then he turned and walked dizzily down stairs, and into the rainy streets.

CHAPTER VIII.

The rain poured down unceasingly, the wind rose, and blew gustily among the trees and chimney-pots, but Robert Yorke did not feel the chill showers that beat into his face. The thought of home, of the cheerful dinner-table and Gertrude's conversation was hateful to him. He could not bring himself to face Miss Elizabeth's cold inquisitive eyes and sneering innuendoes. Better was it to tramp the muddy pavements and be buffeted by the shrill blasts that met him as he struggled round the corners. Out in the dark and the rain there was quietness at least and solitude. And, as soon as it was time for the theatre to open, he would go in for the last time, and look once more at the beautiful, cruel face of the woman he loved, and who had never loved him.

Dr. Yorke was the first person to enter the poor ill-patronised little theatre that night. Wet, cold, exhausted, but not feeling so—feeling only a strange feverish pain and confusion in his brain—he passed into his mouldy little box near the stage.

He had spent so many happy hours in that shabby old building, he had dreamed so many sweet dreams there, that now, as he looked down into the dim empty pit and the vacant orchestra, where a listless boy was placing sheets of music on the various desks, and remembered the gulf that had opened between this sad, heavy-hearted hour and those that were past and gone, a sense of unutterable misery came over him, and he shrank back with a kind of groan into the obscurest corner of the box, burying his face in his wet coat-sleeve. By-and-by a few people, enthusiastic or lonely enough to leave their homes for muddy streets and the damp, foggy theater, dropped in, those in the gallery exchanging audible remarks and beguiling the tedium of the hour with the cracking of many nuts. Then the orchestra appeared, damp, dispirited and tardy, and played a waltz, which seemed to Robert Yorke the most melancholy music he had ever heard, though it was bubbling with Offenbachian melodies which the wretched performance could not entirely subdue.

He sat with his haggard eyes fixed on the green curtain that divided him from Olive Carew, conscious of a certain pleasure in the thought that he was breathing the same air with her, that he would hear her voice again though she might never speak to him any more. And when the play began, and Miss Carew ran on to the stage with a peal of joyous laughter, and wearing the very white dress on which he had seen her fasten the blue knots that afternoon, it seemed as if the cruel scene they had gone through must have been a dream, that he would wake up presently when the curtain fell and walk home as usual with his sweetheart through the quiet streets. The actress was quite unconscious of his presence—some instinct forced him to keep well out of sight while he fed his hungry eyes upon her sweet beauty—and she acted with as much sparkle and *espièglerie* to the dull, empty house as if it had been crowded with what the Guardian called the *elite* of Woolchester.

Was the past already forgotten by that bright creature? Robert Yorke wondered jealously. Had every recollection of her brief engagement to the commonplace country Doctor faded from her mind? Was there no undertone of pain in the silvery laughter that rang so cruelly in his ears, or could pain assume joy's shape so easily in women's hands? Another peal of laughter seemed to answer him with mocking mirth, as if defying him to read the truth in the arch white-lidded eyes that darted sunshine into the foggy pit, from the sweet smiling lips that he had kissed just once and would never kiss any more. Oh, pretty Olive Carew! Oh, her low voice and delicate tender grace, and the sweet red curves of her girlish lips! Why did she ever shine upon his dull life, to bless it for a while, and then to kill him with her falseness?

The play dragged its slow length along and the act-drop had risen for the last time. By-and-by the people would go home yawning and indifferent, not dreaming that the dingy curtain had fallen upon another drama besides that "washed-out" adaptation from the French at which they had been assisting, unconscious of the fact that for one man in the half-empty theatre the end of the play meant the death of his youth and his hopes and his best life. Some such thoughts as these were passing drearily through Robert Yorke's head when—what was it that made him start to his feet with a groan of shame, passion, despair, and stagger like a man stunned by a blow? The comedy was one of intrigue. The plot was seen to turn chiefly on the fortunes of a love-letter written by the merry widow and conveyed by the smart *soubrette*, who at that moment stood with her hands in her pockets and her head on one side, while Miss Carew, with a pen guiltless of ink, traced in the usual rapid stage fashion the words which she was presently to read aloud.

"There, Flouncey!" she cried, signing her name with an elaborate flourish and throwing down the pen. "I think that will mystify my guardian, and assure the Captain that he need fear no rival in my affections. Listen!"

And, as Miss Carew, or "Madame de Haut-ton," read the composition aloud, every drop of blood in Robert Yorke's body seemed to freeze, the lights and faces of the theatre seemed to dazzle him and burn into his very brain. For—line for line, and word for word, he recognized it only too well!—the letter written by the merry stage-widow, and read with archest mischief and laughter by Miss Carew in that character, was the letter on the evidence of which he had chosen to condemn the woman he loved but could not trust—the letter stolen from the actress's room a week before by Elizabeth Yorke.

* * * * * * * *

There was a terrible scene the next morning at the house in George Street. Miss Yorke indeed would still have affected unbelief in the actress, and insinuated that the introduction of the letter in the play was merely one of Miss Carew's clever tricks. But the Doctor's wrath was so tremendous that she was glad to take refuge in a sour and discontented silence until the storm had somewhat abated. Then she asserted herself once more and told Gertrude that she had better pack up her things and accompany her to Lincolnshire, as one house would never be able to hold them and the Doctor's wife.

"My wife!" echoed Robert Yorke, laughing bitterly. "You need not be afraid—I have insulted Miss Carew deeply enough already. Do you suppose I would add to my folly and cruelty by asking her to enter such a family as this?"

"Oh, Robert!" said Gertrude, beginning to cry.

"I don't speak for you, child," her cousin answered, softening—"you have harmed no one—but for myself and your aunt, who will go with me this morning, and apologise with me to the young lady we have both so foully wronged."

Miss Elizabeth colored angrily, and made an exclamation that sounded rebellious.

"Oh, Aunt Elizabeth, do go!" sobbed Gertrude. "If Robert is willing to apologise, surely you need not be ashamed to do so."

"Gertrude, you are a fool!" snapped Miss Yorke, tapping her foot on the floor and swallowing with difficulty.

The Doctor turned to leave the room, and his cousin, timidly approaching him, whispered that she would persuade her aunt.

"And Olive will not be hard upon you, cousin," she added, faltering and blushing; "she knows how you—you love her, and she will forgive you, and all will be as it was before this dreadful mistake occurred."

Robert laid his hand so gently upon Gertrude's head that the poor girl blushed with still more unbecoming intensity.

"You are a good girl, Gertie," he said kindly. "You are the only one in our family who never said an unkind word to—Miss Carew. But you must not think that her engagement to me will ever be renewed, my dear. That is all over now. I was never worthy of her."

Miss Elizabeth uttered an ejaculation of contempt.

"You will be ready in half an hour," her nephew said quietly as he left the room. "If you are not you will understand that my house is no longer your home, and that we are strangers to each other from to-day."

No one but herself knew of the throes and struggles gone through by Miss Yorke before she could make up her mind to kiss the rod. But the Doctor was to triumph. After all, the house in George street was a more desirable place of residence than the farm in Lincolnshire, where her brother's wife reigned absolutely, having come off victorious in more than one domestic skirmish between the two ladies in olden days. Then there was Gertrude to be thought of, as her aunt reminded herself. When that "player-woman" was brought home—for Miss Elizabeth had no hope that Miss Carew would release the Doctor, notwithstanding all his fine speeches—Gertrude would want some respectable feminine influence about her, or who could tell but that she might learn to be as good-for-nothing and affected as the actress herself?

Accordingly, at the hour appointed, Dr. Yorke found Miss Elizabeth, in an elaborate toilet, smiles on her lips, and anger in her eyes, awaiting his appearance, and the two set off together for Olive Carew's lodgings. It was a very silent drive. The man's heart was heavy with bitter unavailing regrets; the lady was mentally rehearsing her apology resolving to render it as little apologetic as possible, and to neutralise the humility of

her words by the uncompromising coolness of her manner. And before many minutes they were at the old house with the iron gate, the commonplace little suburban scene that Robert Yorke would never be able to look at as long as he lived without the keenest and most sacred emotion—the place where he had so often held Olive's hand in his, and looked down into her maidenly eyes—where he had once kissed her on the lips—but to Miss Yorke, an iron gate and nothing more. Something in the look of the place struck a chill to the Doctor's heart as he handed Miss Yorke from the carriage. Some melancholy wisps of straw lay round the steps; the windows of the parlor—the beloved dingy parlor—were thrown wide open, and from one of them a strip of carpet was hanging out. An old play-bill was blowing about on the grass, and two men were carrying away the little hired piano in a van.

"I am afraid Miss Carew is going away," he said, breaking the grim silence that had lasted during the drive; "we are only just in time."

"Going away!" echoed Miss Yorke scornfully. "Not she—she knows when she is well off, never fear!"

But when they knocked at the door, they were told by Mrs. Allen, who looked a good deal puzzled and flurried, that her lodgers were already gone, but that a letter had been left for Doctor Yorke.

As they were following the little woman into her modest sitting-room, a tall young fellow dressed in gray and with a long golden beard appeared at the head of the staircase and descended rapidly at sight of them.

"Miss Yorke," he said hurriedly, "will you be kind enough to come up-stairs to speak to my cousin, Lady Tempest, who is in great anxiety about Miss Carew?"

Lady Tempest—the words took away Miss Yorke's breath—and "in great anxiety about Miss Carew!" Oh, perhaps it was with Lady Tempest's son or husband that the actress had run away! Miss Elizabeth followed Colonel Dacre briskly up-stairs, sustained by the hope of hearing her own worst suspicions about the actress confirmed, and of silencing Robert at once and forever on the subject of Olive Carew's wrongs.

"Here, Flozsy," cried Jack Dacre, bursting into the familiar little parlor, which looked strangely bare and sad and dismantled, as the Doctor saw with a remorseful pang, "I have brought Miss Yorke and her brother, who were Olive's best friends at Woolchester."

A pretty little blonde woman in a traveling-dress turned round from the window at these words, and ran forward in an eager way.

"Can you tell me anything of Miss Carew?" she exclaimed impulsively, seizing both Miss Elizabeth's strong hands in hers. "What has become of the poor girl, and why has she run from us all?"

Miss Elizabeth's face fell.

"We hoped your ladyship could explain that mystery," she said, curtseying, and as sweetly as her disappointment would permit.

"I!" echoed Lady Tempest. "I know nothing—I can guess nothing. I came to Woolchester last night with my cousin, Colonel Dacre, hoping to take Miss Carew home with me to Silverdale until the time for their marriage, and I find that she is no longer here. I never was so distressed about anything in my life!"

"No doubt Miss Carew had her reasons, my lady," suggested Miss Elizabeth, with a happy mingling of spite and obsequiousness.

"But my cousin saw her three days ago. What can have occurred since?"

The two men were talking earnestly together in the window, and Lady Tempest, sitting down on the horsehair sofa by Miss Yorke's side, went on with pretty earnestness to explain how Olive's engagement to Jack Dacre had been broken off two years before by the girl herself, who had behaved very nobly, and how wretched the young man had been ever since.

"And all through me!" the charming blonde cried, blushing a little as she raised her blue eyes to Miss Elizabeth's hard smiling face. "I was not so good or so unselfish as Miss Carew or as poor old Jack. I did not want to give up the money which depended on my marriage with him. I can hardly believe it now when I look back—it does not seem possible that I can be the heartless girl of those days. But,"—the blue eyes sank, and Lady Tempest continued under her breath—"I had never been in love then, and how could I tell what the poor things were suffering?"

ALEXANDER POPE.—Of all the great English writers Pope seems to us the greatest study, for into his poems are infused so much of his own strange, sensitive individuality. He was born in London, May 21, 1688. He was a puny, sickly child, and in the more than half a century that he lived, the poor, unlovely, diminutive and deformed body was never free from sickness or malady. He was a great reader and an ardent lover of Spencer, Waller, and Dryden in his very childhood; and very early displayed his own talent for versification. Of his earliest poetic attempts the "Ode on Solitude" only remains. His first appearance in public as an author was on the occasion of the publication of his "Pastorals" when he was twenty-one years old, but which were written five years before. These were spoken of highly by many of the ablest critics of the day. A life of honor and distinction was at once gained by the poet; he was courted by the wealthy, sought out by the wits of that age, and the bitter and caustic sarcasm of his ready pen was feared by his literary enemies.

His translations of the two great epic poems of antiquity, the Iliad and Odyssey, of themselves would have brought him fame, but they far from exhausted the mental powers he held in reserve and which resulted in his "Imitations," "Satires and Epistles," the "Dunciad" and moral essays. The "Rape of the Lock" is somewhere charmingly described as the "most exquisite specimen of filigree work ever invented; it is admirable in proportion as it is made of nothing. It is the triumph of insignificance, the apotheosis of foppery and folly. It is the perfection of the mock-heroic." The plot—if plot it can be said to possess—is founded on a "trifle light as air," and none but Pope could have thrown around it such a delicate, fanciful, rythmical wreath. Lord Petre severs a lock of hair, in sport, from the sunny little head of Arabella Fermor—a very pretty and very silly little lady, whose dignity was injured and temper fearfully ruffled by such a lawless and daring act; results: a feud between the two families, and Pope's good-natured satire, whose delicious nonsense caused the poem to win public favor at once, passing through three editions, a great literary success for those days.

Pope died the 30th of May, 1744, but his name and works will ever live, and England may well prize the poet who from so humble circumstances as the son of a linen draper, rose to so high and well-deserved a distinction.

There are few poets so widely quoted from in literature and conversation, as Pope; and many terse sentences, familiar as household words, we find in his works, and in closing this fragmentary sketch of our author we will give a few, as possibly many may not be aware from whence these old friends dated their nativity.

In his masterly essay on criticism we have:

"Pride, the never-failing vice of fools."

"A little learning is a dangerous thing," and,

"To err is human, to forgive divine."

By him we are introduced to the Hon. Mr. "Lo, the poor Indian," and from his works, too, we oft hear quoted:

"Beauty draws us with a single hair."

"Whatever is, is right,"

"The proper study of mankind is man."

"Order is heaven's first law."

"An honest man's the noblest work of God."

"Just as the twig is bent the tree's inclined."

"The feast of reason and the flow of soul."

"Honor and fame from no conditions rise;

"Act well your part, there all the honor lies."

THE HERALD OF HEALTH—Contents for August, 1879.—Physiological and Sanitary Marriage and Parentage—By the Editor, (S). Diptheria; what It is and how to Cure It—By M. Cora Bland, M. D.; Vegetarianism in England—By E. F. Bacon; Breaking a Child's Will—By Edwin Faxon; Fear not; Song; Other Mothers; The End of Life; The Summer Exodus from Cities; Society to Promote Studies at Home; Average Sickness of Mankind; Mary W. Mitchell's School; The Prince Imperial of France; A Veteran Hygienist; Linseed Meal Poultice; Sulphur in Diptheria; Methods of Making Bread; Graham Biscuit; Sifted Crackers; Oatmeal Rolls; Gluten Crackers; Cream Crackers; Unleavened Loaf Bread; Cake; Gems; Overexercise for the Heart; Summer Beverages; Current Literature; Health Foods. M. L. Holbrook, M. D., Publisher, 13 & 15 Laight St., N. Y.—$1 a year. Single Copy 10 cents.

The most healthy and intellectual children are born of mothers between 25 and 35 years, and of fathers between 30 and 40 years of age. If the father is very old and the mother young he does not contribute to the molding of the frame of the child and giving it energy and character; but the mother does this, and rarely would a child born of such a union be well developed physically, or possess a harmonious intellectual nature.

The average stature of man is about three inches greater than that of woman, and in the physiological marriage any great deviation from this should be avoided. A very tall man should not marry a very short woman, a very large man should not marry a very slight woman. The man should have broader shoulders than the woman, and the woman should possess more expanded hips than the man. The latter is of great importance for the welfare of the children.

Although women, as a rule, do not contribute so much of the muscular system as men to their offspring, yet from this it must not be inferred that the mother can to advantage lead a sedentary life without injury to her offspring; and here is one of the dangers which men run in seeking for wives the daughters of the wealthy, providing their daughters are educated in the accomplishments and exeused from all labor.

The strongest children are born of mothers who can and do work with their hands. Too much labor or drudgery, however, is not beneficial; but even this is better than idleness. Walker says in his work on intermarriage, that any excessive employment of the muscular or intellectual organs of woman so much unfits her for the highest motherhood. And he might have added that laziness and effeminacy unfit both sexes in a very high degree for parentage.

The age at which a physiological marriage should be consummated is after maturity of the physical powers is attained. If before this the children will not be as highly organized as they might be. Very young marriages are decidedly unphysiological.—*Herald of Health for August.*

THE MIDSUMMER HOLIDAY SCRIBNER.—Since the publication of the first Midsummer Number in 1876, Scribner for August, prepared with special reference to summer reading, has become the literary feature of the summer. The sales of the magazine have increased to such an extent during the past eight months, that the publishers are warranted in printing a first edition of 100,000 copies of the issue for August, 1879. It is thought that this number compares favorably, if it does not excel all previous Holiday issues, one of which was pronounced by the Boston Transcript, the finest example of periodical literature ever put forth. Some of the specialties of the August number are: Whistler in Painting and Etching, with ten engravings of his pictures; a brilliant article affording in its cuts an opportunity for some of Mr. Cole's finest work; the opening chapters of a serial story by Henry James Jr., in the international school which has proved so popular in Daisy Miller, etc, to continue six months; a portrait of Whittier, accompanied by an essay on his literary work by R. H. Stoddard, and illustrated with views of the poet's home; A long poem by Dr. Holland, with two by Bayard Taylor, and shorter poems by Mary Mapes Dodge, Celia Thaxter and others. Other richly illustrated articles are, "A Peep into Antwerp and Holland; Field and Forest Insects, with the wonderful pictures engraved by Henry Marsh, The Cook of the Confederate Army, etc; Short stories and sketches by Charles Dudley Warner; Out of the World—a Shaker story, Frank R. Stockton; Our Archery Club, Noah Brooks; Lincoln's Imagination, Mary Hallock Foote; The Cascarone Ball, and others. Price of this number (160 pages), 35 cents.

MARRIAGE AS A TEST.—How remarkable it is that whenever an enthusiast in religion gets new light, and adopts what he considers "advanced views," he almost invariably begins to tamper with marriage! In this tampering he always betrays the charlatan, and sufficiently warns all who are tempted to follow him to beware of him. There is no better test of a new system or scheme of life than its relation to Christian marriage. If it tampers with that it is always bad, and can by no possibility be good. The Shakers form a community built on this rotten foundation. They destroy the family, root and branch. They have no place for love, and enter into a determined and organized fight with the God of Nature, who, by the strongest passions and impulses He has ever implanted in the human soul, has commanded them to establish families and homes. Shakerism is good for nothing if it is not good universally, if it ought not to be adopted universally. But universal adoption would be the suicide of a race, and a race has no more right to commit suicide than a man. Besides, the damming of one of the most powerful streams in human nature only sets the water back to cover the banks it was intended to nourish and to drain. It is too late to talk about the superior sanctity of the celibate. We have no faith in it whatever. The vow of chastity simply emphasizes in the mind the passion it is intended, for spiritual reasons, to suppress, and fixes the attention upon it. The Shaker, in denying love to himself and all the hallowed influences that grow out of family and home gains nothing in holiness, if he do not lose irretrievably. He is the victim of a shocking mistake, and he disgraces himself and his own father and mother by his gross views of an institution before whose purity and beneficence he and his whole system stand condemned.

Of course we do not need to allude to the Mormon. His views of marriage—revealed, of course—are simply beastly. But these new schemes of life, religion and philosophy are constantly springing up. It is very difficult for any system of socialism to establish itself without tampering with marriage, and one of the best arguments against all sorts of communities and phalansteries and what-nots of that sort, is that the family, as a unit, is unmanageable within them. They can take in and organize a miscellaneous mass of individuals, and provide some sort of a dirty substitute for marriage, but the family bothers them. It is a government, that they cannot get along with. So the marriage test is a good one in all cases of the kind.—*Midsummer Holiday Scribner.*

THE RIGHT HAND RECORD AND READY REFERENCE is a hand-book for advertisers designed by Mr. H. P. Hubbard, an advertising agent at New Haven, Conn. It is indexed with reference to a territorial grouping of papers. An idea of its accuracy may be had from the fact that under "South Gulf States" are grouped Kentucky, Tennessee and Arkansas; Missouri is in the "Northwest," and West Virginia is a "South Atlantic" State. A list of co-operatives are added. The list of papers and circulations (estimated) occupy one-half the page, the remaining half being left blank for memoranda. The price of the book is $2.50. As accurate a directory may be had from any of the large agencies gratis.

USEFUL HINTS.

THE INFLUENCE OF GASLIGHT UPON THE EYE.—The German Minister of Instruction has recently issued a report on the influence of gaslight on the eye. The conclusion arrived at in this report—the result of frequent conferences with well-known physicians—is that no evil results follow a moderate use of gas, if the direct action of the yellow flame on the eye is prevented. For this purpose screens or shades are employed. Very grave objections, however, exist to the use of zinc or lead shades, most evils affecting the eye being traceable to them. Their use, it is said, inevitably tends to blindness or inflammation, and other harmful effects. The milky-white glass shade is the best, as it distributes the light, and has a grateful effect on the eye. The burner should not be too close to the head, as congestions of the forehead and headaches result from the radiated heat. The glass plate below the gas, employed in some places, is especially useful for the purpose, as it causes an equal distribution of light,—necessary where a number are working at one burner,—prevents the radiation of heat, and tends to a steady illumination by shielding the flames from the currents of air. In cases of highly inflamed eyes, dark-blue globes can be very beneficially employed. With precautions of this kind, no evil effects from the burning of gas can be feared.—*Boston Journal of Chemistry.*

A COTTAGE WATER-FILTER.—Those who cannot afford to buy a filter may easily make one. Stuff a piece of sponge in the hole of a flower-pot, place above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal to prevent it from being stirred up when the water is poured in. The contents of the flower-pot should be occasionally renewed. But by a small addition to this a cottage filter may be made, which, for practical use, is quite equal to the most expensive filter of corresponding size. It consists of two flower-pots, one above the other, the lower one fitted with a sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the largest, and if the lower one is strong the upper one may stand on it, or a piece of wood with a hole to receive the upper pot may rest on the brim of the lower one. The two pots thus arranged are placed upon a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, and the sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for two or three years without being renewed if the upper sponge be occasionally cleaned. Care must be taken to wedge in the upper sponge tightly enough to prevent the water passing through the upper pot more rapidly than it can filter through the lower one.—*Leisure Hour.*

RELIEF FOR BURNING FEET.—To relieve burning feet, first discard tight boots; then take one pint bran and one ounce bi-carbonate of soda, put in a foot-bath, add one gallon of hot water; when cool enough, soak your feet in this mixture for fifteen minutes. The relief is instantaneous. This must be repeated every night for a week or perhaps more. The bran and bi-carbonate should be made fresh after a week's use. Bi-carbonate of soda can be purchased for a small price per pound from wholesale druggists. The burning sensation is produced by the pores of the skin being closed, so that the feet do not perspire.

TO PREVENT THE HAIR FALLING OUT.—The common application, in Oriental countries, is the bruised bulbs of the *Asphodelus bulbosus*, garlic or onions, mixed with gunpowder. An infusion of the small leaves of the orange or lemon tree in red wine, containing twenty grains of tannin per litre, has also proved serviceable.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

RETROSPECTION.

BY "BOHEMIAN DASH."

A ROSE, a leaf, two broken rings—
Mama, why keep these worn old things?

A lock of hair, a picture—see!
Can all these things come play with me?

A piece of whip, an old kid glove;
A card, with "*love*," "love."

A picture with blue eyes is here,
And two hearts on it—oh, so near!

And here's some violets stowed away;
Please may I play with these to-day?

I wonder if you mean to keep
These queer old things in here asleep!

No, no, my babe, my dark-eyed pet,
You must not touch these trifles—yet.

The leaf, and rose, and other things,
I've kept with thoughts kind memory brings.

That picture, with the eyes of blue,
Once loved Mama—if sighs be true.

The violets hide a thought of home—
So let the tiny things alone!

I could not, darling, give you these
Old broken rings nor withered leaves.

A token bright they are for me,
Of friends now far beyond the sea.

The baby-face looked into mine,
And said: "*I'll play with these some other time.*"

[New Orleans Times.

"HOME PROTECTION."

An Argument for Woman's Temperance Ballot.

BY FRANCES E. WILLARD,
PRESIDENT OF ILLINOIS W. C. T. U.

WOMEN DO NOT WISH TO VOTE.

"But women do not want to vote." This is the last ditch of the conservatives. The evolution of temperance sentiment among women hitherto conservative refutes this argument; yet I confess

there are many who do not yet perceive their duty. But Jack's beanstalk furnishes only a tame illustration of the growth of women in this direction in the years since the Crusade. Of this swift growth I have already furnished abundant proof. It is, in my judgement, the most solid basis of gratitude on this national anniversary.

During the past years the brave women who pioneered the equal suffrage movement, and whose perceptions of justice were keen as a Damascus blade, took for their rallying cry: "Taxation without representation is tyranny." But the average woman, who has nothing to be taxed, declines to go forth to battle on that issue. Since the Crusade, plain, practical temperance people have begun appealing to this same average woman, saying: "With your vote we can close the saloons that tempt your boys to ruin"; and behold! they have transfixed with the arrow of conviction that mother's heart, and she is ready for the fray. Not rights, but duties; not her need alone, but that of her children and her country; not the "woman," but the "human" question is stirring woman's heart and breaking down her prejudice to-day. She begins to perceive the divine fact that civilization, in proportion as it becomes Christianized, will make increasing demands upon creation's gentler half; that the Ten Commandments and the Sermon on the Mount are voted up or voted down upon election day; and that a military exigency requires the army of the Prince of Peace to call out its reserves.

The experience which opened the eyes of one cultured conservative in Illinois is here in point.

Mrs. Blank was my companion at the Capitol, where, with other ladies, we spent several weeks in the endeavor to secure legislative support for our Home Protection measures. One of the members, when earnestly appealed to, replied, with a rueful grimace: "Ladies, when I tell you the leading towns in the district I represent, you will see that I cannot do as you wish," and he rattled off such names as "Frankfort, Hamburg, and Bremen," wished us "the success that our earnestness merited," and bowed himself out.

"Why—what—does—he—mean?" inquired my lovely Conservative, in astonishment.

A committee clerk stood by, who answered, briskly: "Why, ladies, the Hon. Mr. A represents a district in which German voters are in the majority; therefore, he cannot support your bill."

"Why, I thought a lawmaker was to represent his own judgment and conscience," murmured the sweet-voiced lady.

"His judgment, yes; for that tells him on which side the majority of votes in his district is located. His conscience, no; for that would often cost him his chances for a political future," answers the well-instructed youth.

"O-o-oh!" softly ejaculated Mrs. Blank, in the key of E flat, minor scale.

By this time Hon. Mr. B entered; in response to our invitation, of course—he never would have come on his own motion. After a brief conversation, he pledged himself to vote for our bill and to make a speech in our favor. Nevertheless, if you should glance over the list we are carefully preserving and industriously circulating in Illinois, of men who voted against us, you would find his name. Nevertheless, he is an honest fellow in his way, and we owe it to a motion made by him that women were, for the first time in history, allowed to speak before the legislature of Illinois. He explained his desertion of the temperance cause in this way: "I tell you, ladies, I've got to go back on you. I'm leader of my party in the House, and they've cracked the party whip mighty lively around my ears. The long and short of it is, I've got to represent the men that voted me in."

Poor Mrs. Blank! How appealing was her voice, as she replied: "But I am sure your better nature tells you to represent us." Hon. Mr. B brought his great fist down on the table with a stalwart thump, and said: "Course it does, Madam; but, Lord bless you women, you can't stand by a fellow that stands by you, for *you hain't got any votes.*" Just here a young lady of the group piped up: "Oh! but we would persuade our friends to vote for you." "Beg pardon, Miss; but you couldn't do nothin' of the kind," said he. "Don't you s'pose I know the lay o' the land in my deestrict?" The young lady now grasped the other horn of the dilemma, saying, desperately: "But we will get the temperance men in your district to vote against you if you desert us in this manner." His rejoinder was a deplorable revelation to our simple-minded company: "Never a bit on't, Miss. The temperance men are an easy-going lot, and will vote the temperance ticket anyhow. Old dog Tray's ever faithful! We've ignored them for years; but they come up smilin' and vote the Republican ticket all the same. You'll see!" "But won't you stand by us for God and home and native land!" pleaded Mrs. Blank, with a sweetness that would have captured any man not already caught in the snares of a German constituency. The worthy politician thumped on the table again, and closed the interview by saying: "You women are altogether too good to live in this world. If you could only vote, you'd have this legislature solid. But I'm bound to stand by such a conscience as I've got, and it tells me to stick to the fellows that voted me in. Good-morning!" And he got speedily out of the range of those clear, sad eyes.

Hon. Mr. R (an ex-senator) came in. With all the vehemence of his Irish nature he anathematized the "weak-kneed temperance men." "Sure as you're living, I told you the truth," said he. "The temperance men are a hissing and a by-word. They're the foot-ball of parties. There's none so poor to do 'em reverence. Where are the plucky young fellows that were here when we gave Illinois her present local option law?" (By the way, that law bears the name of this valiant senator, who is, by the same token a Democrat) "Where are they? Out in the cold, to be sure. Did the temperance folks remember their services and send 'em back? Not a bit of it. But the whisky men didn't forget the grudge they owed 'em, and they're on the shelf to-day—every last man of 'em." "I tell you," and the wise old gentleman gesticulated wildly in his wrath, "until you women have the power to say who shall make the laws and who enforce 'em and to reward by re-election them that are faithful to your cause and punish by defeat them that go back on it, you may hang your respective bonnets on a high nail, for you'll not need 'em to attend the funeral of the liquor traffic!" "Why," exclaimed one of the ladies, confusedly, "you don't mean to say that the temperance ballot is not enough, and that we must follow in the footsteps of Susan B.——?" The sturdy old gentleman walked to the door, and fired this Parthian arrow back at us: "Susan could teach any one of ye your a-b-abs. This winter's defeat'll be a paying investment to ye all, if you learn that a politician is now and ever will be the drawn image, pocket edition, safety-valve, and speakin'-trumpet of *the folks that voted him in.*"

The ladies drew a long breath. "I begin to see men as trees walking," slowly murmured sweet Sister Blank.

"But we must abide the Lord's time," warningly uttered an old lady, who had just arrived. To her the brisk committee clerk ventured this answer: "But Senator R. says you'll find the Lord's time will come just about twenty-four hours after the women get their eyes open!"

A temperance member of the House is the last caller whom I will report. He spake in this wise: "Ladies, I pretend to no superior saintship. I am like other men, only I come from a district that would behead me if I did not stand by you. I have a pocket full of letters, received to-day from party leaders at home, assuring me I run no risk." At the close of three weeks of such a school as this, one of our radicals asked Mrs. Blank, chief of conservatives, this pointed question: "Are you still for the Home Protection vote alone, or for the ballot on all questions?" She replied, in thrilling tones and most explicit words: "Any woman who could have shared our bitter experience here without desiring to vote on every officer, from constable to President, would be either a knave or a fool."

MAKE SELF-INTEREST OUR ALLY.

This lady reasoned that, since we are solemnly bound to be wise as serpents, we must harness self-interest to our on-moving charity. The great majority of men who are in office desire to be re-elected. By fair means, if they can; but to be re-elected anyhow. Only in one way can they bring this to pass: by securing on their side old King Majority. If we furnish them with a constituency committed to the proposition, "The saloon must go," then go it will, and on the double quick. Let the city council know that women have the ballot, and will not vote for them if they license saloons and they will soon come out for prohibition. Let the sheriff, marshall, and constable know that their tenure of office depends on their success in executing the law thus secured, and their faithfulness will leave nothing to be desired. Let the shuffling justice and the truckling judge know that a severe interpretation of the law will brighten their chances of promotion, and you will behold rigors of penalty which Neal Dow himself would wince to see.—To be continued.

INEXPENSIVE HOUSEHOLD DECORATIONS.

When furnishing a home, the first thought should be in regard to the appearance of the walls. Sleeping-apartments and kitchens are effective when painted, but if this be too expensive an undertaking, a little coloring material, such as Prussian blue, ultramarine blue, chrome-yellow or lake, according to the tint required, may be mixed with the kalsomine, the effect of the latter when properly applied being just as satisfactory as paint. Sitting-rooms, parlors and dining-rooms are very pretty when either painted or papered, paper being the least expensive, unless it be of a superior quality.

Tidies for chairs and sofas, covers for tables, and mats for the various vases and miscellaneous ornaments to stand upon, add much to the charm of a room, and their cost is but a trifle when made at home. Pretty and inexpensive articles of this sort are made of Java canvas, embroidered in fancy designs with wools of uniform or shaded tints. This canvas can be purchased in several different shades of red, yellow, drab and brown, and also in black and white. The color of the worsted may either contrast or harmonize with the canvas, one, two or three contrasting shades being the most effective when tastefully commingled in the pattern. "Daisy" tidies are dainty in effect and easy to make, and the material required for them costs but a mere trifle. They are made of bleached muslin, white lawn or Swiss muslin, cut in circles about two or three inches in diameter and gathered closely about the edges, which are by this means drawn to the center of the circles on the upper side, where they are concealed under a rosette of bright-yellow worsted. These little "daisies," which bear a striking resemblance to those gathered from the fields of Nature, are joined together in star, diamond or other fanciful shapes, and are very pretty when fastened to the back of the chair, lounge or sofa. Sometimes red, blue, pink or violet worsteds are used, but the effect is not so natural and consequently not so much admired. A toilet-set always consists of a bureau or dressing-case cover, a pin-cushion and two small mats, all of which may be embroidered Java canvas.

An airy set may be made of paper-muslin or Silesia, overlaid with plain or dotted white Swiss, bordered with deep lace or lace-edged ruffles of the material. The paper-muslin should be of some delicate shade of blue, pink, gold or green, or else of cardinal-red, and should be cut to fit the bureau or dressing-case smoothly. The cover is bordered with ruffles of the same neatly pinked out at the edges, and after being fastened smoothly to the bureau, is overlaid with the Swiss cover, through whose delicate, transparent texture the color of the under-cover is prettily displayed. The cushion and mats should be made to harmonize with the cover. Paper muslin is preferable to Silesia, as it holds the lace out better, and when the unglazed side is turned out, the difference is not perceptible unless closely examined.

Pretty corner-brackets may be made of pieces of common wood, cut to fit snugly in the corners, and covered with embroidered canvas, or with cashmere, flannel, merino or silk, either painted, embroidered, or decorated with *decalcomanie* pictures. These little articles very effectively decorate vacant nooks, and may be made to hold a tiny statuette, pretty shells, a vase of flowers or other tasteful ornament.

To keep a house orderly, and to prevent newspapers, journals, etc., occupying every table, chair and stand in the room and even the floor, as the thrifty housewife too often finds them so disposed of by her forgetful better-half, there should be wall-pockets or paper-receptacles of some kind. These articles may be made of pasteboard, covered with colored or fancy paper of some kind, or with cashmere, silk, embroidered canvas or any other desirable fabric. *Decalcomanie* pictures, silk or ribbon ruchings, gilt-paper bordering, hand-embroidery or painting will decorate them charmingly.

Beautiful little receptacles for flowers and miscellaneous articles can be made of splints, spirals or straws, and bright-colored worsted or narrow ribbon or chenille. Frames for small pictures, dainty baskets, easels, sewing-baskets, hair-receivers and many other useful and pretty articles are made of splints, and their cost is the merest trifle.

For large pictures, and small ones too, for which frames cannot be conveniently purchased, very effective frames may be made of paper-muslin. No doubt paper-muslin picture-frames will sound queer to many, and some will smile at the idea of such a thing, but they are really pretty when tastefully constructed, and the suggestion will be readily seized upon by the home-loving woman, who likes to adorn her house, but is sometimes very much puzzled to know how to do so with a very small sum of money. The paper-muslin may be either black, or a very dark brown or cardinal shade, as these resemble most closely the colors of the dark wood usually employed in the manufacture of such articles; or it may be of any of the gold shades, to resemble gilt. It is cut in strips of a width to suit the size of the picture—a large picture needing a frame at least three inches wide—and joined together. One style of frame has the edges pinked out, with the strips laid in double-box plaits made very close together and tacked through the middle of the frame under soft tufts of bright-colored worsted. Another kind has the strips shirred through the center and at each edge over thin wire. Both kinds are pretty and may be used in the same room to give variety. After the muslin is shirred or plaited, the picture is fastened at the edges to a thin board or a piece of thick pasteboard, which should extend sufficiently beyond the margin of the picture to support the frame. The plaited or shirred muslin is then fastened by tiny tacks to the board, and a large bow of ribbon is placed in each corner. The wired frame should bulge outward at the center, and the plaited frame may be left perfectly flat, or the opposite ends of the plaits may be caught together with a charming effect.

A goblet, from which the shank has been broken, may be utilized in the following pretty way: It must be first concealed in a crocheted or knitted cover of some bright-colored worsted, and suspended by picture-wire from the center of the ceiling or window. It is then filled with water, in which may be placed myrtle, wandering Jew, sweet potato, or any two or three vines that will grow in water. If climbing and trailing vines are both used, the climber may be trained up along the suspension wire, while the other will droop prettily over the sides. The water must be renewed at least weekly, if the room be any way warm.

The crowning ornament of all is the fire-place fernery. It is very simply and cheaply made, and yet is one of the handsomest decorations for a parlor, sitting-room or dining-room. A box, about three or four inches deep and fitted perfectly to the fire-place, so as to present the appearance of being a portion of the mantel, is made of common wood, lined with tin or zinc so as not to leak, and then painted in any color that will best accord with the color of the mantel. If the mantel is white marble, the box is more effective when black. A very simple and inexpensive method of imitating ebony is to blacken the box with burnt wood and then coat it with black varnish, which must be well applied so as to produce a good polish. All communication with the chimney should be well shut off, and the back of the fire-place covered with panel-paper, which may portray a "deep and gloomy wood," a gleaner, a stork, Cupid in a bower of roses, or any scenery preferred. The box is then furnished with rich soil, and well filled, but not crowded, with ferns surrounded by moss; and if the fire-place is very large, moss-covered rocks may be used with a charming effect for filling in. In this event, the ferns should be planted between the rocks; and the more natural the arrangement, the handsomer the result. Every particle of earth should be covered with moss, and an ivy placed in each end of the box should be carefully trained along the margin of the fire-place to simulate a bower. The roots and foliage of the plants should be well watered every day, as ferns require a great deal of moisture.

This arrangement makes an exceedingly handsome fire-place ornament, and so long as careful attention is bestowed upon it, the fernery will keep nice and green and will continually be improving in appearance. A fancy mat of some kind placed in front of the fernery will lighten the pretty effect of the room so decorated.—*Delineator for August.*

TALKING.

Talking is an art too much neglected among a large class of people. The importance of its cultivation can not be too highly valued for the pleasure which a brilliant talker gives to a company cannot be equalled by any other art.

I do not mean to say that its charm is greater than that of music; for nothing is more elevating and refining in its influence, nothing can so quickly soften and subdue the feelings as the sad and mournful passages, or so quickly enliven as the joyful strains of music, but after listening to music for a certain time its pleasure begins to pall. We want to be engaged in something more active than merely listening. One very seldom becomes tired of talking with people who are gifted with conversational powers.

But how often do we meet people, who have spent years and years in study, people whose knowledge is really encyclopediac, but who are utterly unable to entertain others with their conversation. Many who are greatly their inferiors in education, shine brighter in society. These latter possess the faculty of imparting what they know, while the others do not receive credit for knowing as much as they do, simply because they have not cultivated their social natures. They find that their society is not so much sought after as that of the other class, and it is not strange that it is so, we would all rather read a cheery interesting book, than one which contains only dry facts.

It is not what we know, but what we are capable of telling that makes our company desirable. Sometimes it is a lack of words and sometimes a lack of ideas that causes us to fail in our attempt to converse. Then awake and shake off the indolence that prevents your mental faculties from performing their office. Form opinions on everything and compare them with the opinions of others; arrange your thoughts before uttering them, and cloth them, in choice language. Here is another difficulty to overcome, your thoughts have for so long been allowed to wander at will, that it will require all your energy and determination to confine them to any particular subject. But do not become discouraged, make every possible effort to overcome the deficiency, and I have no doubt but that you will be successful. I. F.

Millersville, Saundusky Co., Ohio.

REPLY TO FAITH IN RURAL OF JULY 12.

I have a word to say in reply to Faith on the question whether religion and worldly prosperity go together. Does not the sober, second thought tell us that, although they may go in company, they do not necessarily do so? Will not observation show us that in the majority of cases, very rich men become so by notoriously violating every divine law? Does it not seem like making a contract with the Lord if we say, or, in effect say to Him, "Prosper us in worldly matters, and we will give largely to Thy cause?" It looks like working well from too low a motive. God says, "He maketh His sun to shine on the evil and on the good, and sendeth rain on the just and upon the unjust," and are not evil doers prospered if they conduct their affairs on business principles?

The mistake seems to be in supposing that the good things promised in the Bible mean riches and worldly honors, and that happiness is inseparable from them. But if God "withholds no good thing from those who walk uprightly," then will He not give us riches if we are upright, if He sees that they are good for us to have? We can all call to mind persons who are rich in a worldly point of view, but who, on account of undisciplined tempers or evil tastes, are anything but objects of envy; and do we not also know those who are obliged to toil for a livelihood and are destitute of the luxuries which wealth brings, and who are yet truly happy because they possess that serenity of mind which peace with God brings? We cannot all be rich in worldly goods, whatever we do, in this uncertain world, but by loyalty to the principles of right laid down in the Scriptures, we may have what riches cannot buy. B. C. D.

CORRESPONDENTS' CORNER.

I have been very much interested in the Woman's Club, but I think dish washing and silk dresses have been discussed enough. We all have dishes to wash more or less, and we that are mothers have more disagreeable tasks than even dish washing, but we can't get the consent of our minds to use the very primitive dishes that our good Mother Eve used, so I think submission without so much complaining, would become us just as well. I like the fashion plates that appear from time to time in the Rural. Has any Rural reader tried the Horsford bread preparation and with what success? please state through the Rural and oblige a constant reader. Mrs. S. J. W.

Salem, Marion Co., Oregon.

I read with much interest that "argument for the woman's temperance ballot," and I can say, for one of "the lords of creation," that I would be perfectly willing to put the excise ticket in the hands of the women as the excise law now stands in this State. Although I cannot place confidence enough in them on political questions, yet I deem the temperance question perfectly safe in their hands. Yours truly, Wm. C. L.

Berkshire, N. Y.

The rubber rollers of wringers soon crack with use and need to be replaced. They may be mended by winding a piece of new factory or cotton flannel smoothly around the damaged place and sewing it across evenly. I think it might be well to sew a piece of cloth the whole length of the roller when the wringers are new; it would preserve them much longer. Aunt Rachel.

Please ask some one to give a design for piecing a remembrance quilt, one that will require only one block of each kind of print, and not so large that where you have but little of some friend's dress you will be obliged to leave it out.

Constant Reader.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MRS. ENDICOT'S JOURNAL.

Children's photographs; birth-day; white apron; handsome tidy; two ways to prepare apples; Sunday dinners; young chickens; hard-boiled eggs.

August 2.—"Can't you go down to W——'s this morning?" asked Barton of me at the breakfast table, this same W—— being what we consider our best photographer. At first it did seem impossible on that warm day to make the needful exertion to dress the children and myself and then spend an hour, or perhaps more, in those hot rooms; but the remembrance of the long-deferred promise to Grandmama Endicot changed my no to a "Yes, we will go just as soon as we can get ready." For one thing, I was glad to go while the little folks felt fresh. Baby Katy proving willing to be so soon redressed, it did not take long, for only their usual "go-to-meeting clothes" were worn, for I wanted Grandmama to have the children's photographs as near like themselves as possible. We had intended to have a group, but Mr. W—— advised differently, Harry being so dark, and Della so fair. Finally we had full-length cabinet pictures, which gave perfect satisfaction, when they came home on Saturday. Barton had purchased an album for holding cabinet-sized pictures in the front, and as my contribution I placed in it a card on which was painted a cluster of daisies and violets, with the date of the children's pictures. Harry then rode down to the express office with it, for it must reach Grandmama in time for her birth-day. But I hardly think she will enjoy receiving it more than the children have enjoyed helping to prepare it. Birthdays are always kept in some way at our house; sometimes the way has to be very simple, but I think the increase of kindly thoughts it brings, is an ample repayment.

When I ran into Mrs. Kay's this afternoon, I took mental notes of an apron her niece, a young lady who is visiting her, had on. I thought it was very pretty and it brightened up a dark dress wonderfully. It was made of a plain breadth of Swiss, and was a little more than half a yard long. There was a row of Italian inserting across the bottom, and just below that was a plaited ruffle, about four inches deep, finished with a narrow Italian edge. There was one pocket made of the inserting and edge, and finished with a bow of blue ribbon, of which the band was also made, which was fastened at one side with a loop and two ends about six inches long. She was working at a very pretty tidy. She told me it was made of a piece of cream-colored Silesia half a yard wide, and the length of the tidy was the width of the goods. An edge of scarlet zephyr was crocheted all around it. In the center, looking as if painted, was a bunch of flowers covering a space of about six inches long and four broad, cut from chintz and hemmed on with fine thread. There was also a small cluster in each corner. I don't think I ever saw anything prettier for the time spent on it, and the expense was trifling—not more than thirty cents.

August 9.—This has been a most busy Saturday, the work of two days being crowded into one; but there is a very appetizing odor when the pantry door is opened. Four loaves of white and two of brown bread, the crusts wet with cold water, and each loaf rolled separately in a cloth, are leaned up against a pan on the bread board, to get perfectly cold. While the bread was in the oven, I prepared a large baking-dish of apples as for sauce. Part of them I put in a shallow dish and covered with a crust made as for pie. When the bread came out, both were put in the oven. In about half an hour the apples were tender and the covered dish was nicely browned. I took off the crust, placed it on a plate, mashed the apples with a spoon, and added a good-sized piece of butter and plenty of sugar, and then put on the crust. With the addition of rich sweet cream, when eaten for dinner, Barton said "it was a dish fit for a king," and I knew it to be much less hurtful for the stomach than the customary pie or pudding.

The other dish was just sweetened, and set away for Sunday's dinner. We all think apple-sauce when cooked in this way, is much finer-flavored than in any other. Della says, "dinner is always better on Sunday, than on any other day;" yet it is always cold and prepared the day before, excepting the coffee. For to-morrow we are going to have cold chicken, hard-boiled eggs, apple-sauce, sliced tomatoes and coffee, with a plentiful addition of boiled milk for the children. The chickens were prepared by splitting them down the back with a sharp knife, then washing and wiping them dry, seasoning with pepper and salt, and baking them in a moderate oven three-quarters of an hour. Young chickens are much nicer prepared in this way, than in any other, when they are to be eaten cold.

The eggs were boiled briskly for half an hour, and then dropped into cold water, a plan which keeps the yellow from getting dark. As for the coffee, I don't think all the children get will hurt them. I prefer they should have the warm drink than cold milk or water. Since Aunt Hatty's visit I have always boiled the milk for coffee, using it while hot. We consider it a great improvement.

Harry is reminding me of my promise to come and help him decide which pair of chickens shall have the honor of appearing at our county fair, the last of September.

A LETTER.

DEAR MRS. MAPLE:—How is it that people who write and advise others so seldom practice what they teach? How is it that the Agricultural or Horticultural writers, dreaming over their theories and advising others, are so frequently remarked upon for being so impractical? Even their servants seem to partake of the spirit of the masters, and go about with a dreamy, listless air, as if, somehow or other, the work would do itself.

There is no rule without exception, and I do not wish to imply that all writers are of necessity impractical, for, of course, my experience is limited to a very few. I have observed the same thing in women who write from a domestic standpoint. The most impractical and uncomfortable housekeeper I ever knew writes for a weekly paper, and writes well, which brings a smile to the faces of all who read her articles—at least, within the limits of her acquaintance. It was said of a lady, who shall be nameless here, that, although she published a very good work on cookery, her house presented a scene of confusion which would bring to mind Dickens's description, in "Bleak House," of Mrs. Jellyby in her domestic relations, a scene so well described that, once read, it can never be forgotten.

A good recipe, that has been thoroughly tested, should not be condemned; but the truth is that many recipes are sent out by persons who know nothing about them except from theory, and if followed, they would result very much after the fashion of the Frenchman's plum-pudding, when he said, "I copied ze recipe and put ze puddin' in ze pot, and, *mon Dieu!* ven I took it out, it vas soup."

Mrs. Harriet Beecher Stowe, in her "Minister's Wooing," describes most graphically the preparations for an old-fashioned New England tea party. She sent her heroine into the kitchen to make cake, with the remark that, whatever recipe she followed, to be sure to put in plenty of faculty. "Faculty, my dear child," said her mother, "is a very important ingredient in the cake." I agree with Mrs. Stowe that faculty is a very important thing; but in sending out advice and recipes into the kitchens of our farmers and other families, it should be borne in mind that the best judgment is not always there.

A little conservatism in household matters, and especially in the culinary department, I would heartily recommend to all housekeepers, as also to be cautious in trying new experiments. Stick to the good old ways as long as they are good—but here I am giving advice, and that is something I had no intention of doing. MRS. M. H. S.

HANGING-BASKETS.

I WOULD like to tell the lady readers of the RURAL how to make hanging-baskets at a slight expense, at least for less than the actual cost of such articles bought in stores, and, to my mind, they are then no prettier than those made at home. Procure a wooden bowl, a stray rusted tin basin or wash-dish, which is the best shape for the present purpose; cover the outside with a coat of putty, and place on it, in rows, groups or clusters, little shells. A row of tiny "dust-pan" shapes are pretty for a border. The contrast of the green leaves drooping over the white shells is very pretty. Or, if shells are not to be had, a "pounded" mixture of bits of different colored glass pressed into the putty makes the uninitiated believe your basket to be made of diamonds, especially when the sun is shining on it. The "snowflake" baskets, made of raveled white cloth, look cool and hint of spicy woods and nodding violets, through the long winter, if filled with ferns and hung in some shady window. Gather the ferns while green and fresh, and pile them on a platter, or even a board, cover them with thick, wet moss, and they will keep moist and green during the winter, to replenish the baskets or vases. Try it.

EVA EDGERTON.

DOMESTIC RECIPES.

Rice Pudding Without Eggs.

I have an excellent recipe for rice pudding without eggs, which I know to be good from experience. Look over and wash a common-sized tea cup of rice. Put into a pudding dish with four quarts of milk, add one pound raisins, a little salt, lump butter, size of an egg, and season with cinnamon. Stir occasionally, until it boils. No pudding with eggs can exceed this, if attended to according to directions.

AUNT EM.

Pumpkin Pie.

Cut the pumpkin into thin slices and steam until tender. Mash and rub through a sieve. To a quart of pumpkin add two quarts of new milk and six eggs. Sweeten to taste, and season with a dessert spoonful each of ground cinnamon and ginger, a grated nutmeg and a teaspoonful of salt. Heat the mixture and pour into pie-dishes lined with paste. Bake until set and delicately browned. E. M.

QUESTIONS ANSWERED.

Tomato Catsup.

Mrs. G. W. B., wishes our recipe for tomato catsup.

ANS.—The directions we append were given us by an acquaintance seven years ago, and we have followed them each season since with entire satisfaction. One bushel basket of tomatoes, three large teacupsful of salt, two tablespoonsful of cayenne pepper, four ounces of whole black pepper, two ounces of whole allspice, two ounces of whole cloves, four ounces of grated nutmeg. Wash the tomatoes, put them into a kettle, and mash as fine as convenient. Add the salt and spice and boil two hours. Then, when cool enough, strain through a fine sieve, careful to rub through all of the pulp. Put back to boil for four hours longer. When cool, bottle, drive in the corks, previously soaked in boiling water, and dip into sealing wax. Invert the bottles and keep in a cool, dry cellar. During the last boiling—four hours, the catsup needs almost constant stirring to keep from burning.

To Green Pickles.

Mrs. Sargent wishes to know how to "green" cucumber pickles with grape leaves.

ANS.—Put into your pickling-kettle, which ought not to be brass, alternate layers of grape leaves and pickles. Press them down and cover with alum water made in the proportions of two small teaspoonsful of powdered alum to a gallon of water. Set the kettle over a moderate heat where the pickles will come to a scald but not to a boil. Cover the kettle closely and let it stand on the back of the stove for four or five hours. Then throw the pickles into *cold* water. Prepare the vinegar and pour over the cucumbers as soon as they are cold.

News of the Week

MISCELLANEOUS.

Monday, August 18th, 1879.

The question whether one State can sue another on account of claims held against the latter by individual citizens of the former is about to be put to the test by New Hampshire. A recent law of that State authorizes the attorney-general upon his discretion to bring suits against other States in behalf of any citizen who assigns his claim to the State and gives a bond to cover the costs of procedure, the net avails recovered to be paid to the individual creditor. A similar law passed the Legislature of New York and was vetoed by Gov Robinson. Thomas B. Potter, M. P. for Rochdale and a well-known English liberal, has arrived in this country and will have a cordial reception. A political pupil of Cobden, he has been his most loyal disciple, and founded the Cobden club to spread his doctrines. Mr. Potter was one of the staunchest friends of this country during the war and will see as much of it now as he can in a brief stay.

During July 12,710 immigrants landed at New York against 8,689 in the same month last year. For the year ending July 31, the increase in immigrants was 27,106. The last report of the British commissioner of customs lays significance on the fact that the value of British exports to this country in 1874 was $141,000,000, and in 1878 but $72,400,000. The "Yazoo" plan has been tried in Rankin county, Miss. A mass meeting of Democrats appointed a committee to order Major D. F. Sutton to withdraw from his canvass and leave the country. Sutton is an old and respected citizen with no offense charged against him except his candidacy. Both the Vicksburg papers condemn this spirit of lawlessness. Yazoo county is quiet now, but the independents are to hold a meeting soon, and more trouble is expected. The New York Herald devotes four columns to recent developments in the Stewart grave robbery. It says that in January a Nassau street lawyer received a letter from Montreal, signed "Romaine," enclosing a retainer of $200, and asking him to take charge of negotiations with Judge Hilton for the return of the body which was offered for $250,000. He also received by express, as an evidence of the good faith of the writers, the silver knobs and parts of the handle of Stewart's coffin, and the coffin plate. The lawyer communicated these facts to the police, but assured Hilton and Mrs. Stewart that the only way the body could be recovered was by the payment of a quarter-million. Hilton refuses to negotiate, and threatens the arrest of the negotiating parties.

Rochester, N. Y., has won a complete victory in its long contest with the New York Central, a fair illustration of the changed relations between railroads and the cities through which they pass. The tracks of the Central cross the streets of the city at grade, and the dispute arose over the cost of the changes necessary to prevent accident. Vanderbilt now offers to raise his tracks 20 feet, crossing the streets on iron bridges, at a cost of $600,000, which is to be paid wholly by the railroad company; the only concession asked being the closing of certain streets. When the tracks of the Central were sunk in New York city at a cost of over $4,000,000, the city paid half the expense, and the railroad, speaking in a general way, got all the profit. The National cotton exchange met at New York Wednesday, John Phelps of New Orleans, calling the convention of 70 members to order. The annual report of the executive council declares that during the last five years cotton culture in the United States has outstripped the most sanguine expectations. The problem of free labor is virtually solved and the South must be regarded as the future reliance of cotton manufacturers in both America and Europe. Taking the average of the last few years, but 31 per cent. of the cotton crop is manufactured in the United States, 69 per cent. going to feed the mills of Great Britain and continental Europe. Reports from all the southern cotton exchanges to July 31, state that the cotton plant is small, but is forming, blooming and boiling well. The reports are generally as favorable or rather better than last year, except that the crop is a little later, outside of Texas. Picking has begun there very much earlier than usual, and the early receipts are expected to be unprecedentedly large, at the expense of later months.

The Tribune says that a further advance in eastbound freights of five cents per 100 from Chicago is contemplated. The present rates which went into effect August 4, are already a large advance over those prevailing heretofore. The new rates are expected to begin August 24. Prominent merchants and planters in Mississippi have sent a delegation of colored men to Kansas, to see how that State is adapted to settlement by negroes. The supposition is that the delegation will return with an unfavorable report, and thus stop the negro exodus. As the party is largely composed of whites, such a supposition may prove true. The people of several counties in Texas are anxious for the negroes to emigrate. The new Tramp law of Pennsylvania goes into effect on the 15th inst. The undesirable residents will leave there shortly. A colored debating society in Lee county, Ga., recently had before it for discussion, "Which are the most benefit to the country—the Lawyers or the Buzzards?" After a heated debate the question was finally decided in favor of the Buzzards.

The present prospect is unfavorable for an early repeal of the order prohibiting the importation of American cattle into the dominion of Canada. It is stated that the imperial government will forbid the importation of Canadian cattle to England if that barrier is removed. The Chicago Inter-Ocean undertakes to prove that the lake region is to become the great center of iron manufacture. Cheap transportation for the Lake Superior ores, easy access to great coal fields, which is specially true of Chicago, Cleveland, Buffalo, Milwaukee and Detroit, and the excellent facilities found at these points for shipping the manufactured products, it is argued, must sooner or later divert this valuable business to lake ports from less favored cities like Pittsburgh.

Up to the adoption of the new constitution, mortgages in California contained a clause providing that the borrower should pay any tax which might be imposed on the value of the mortgage. The new constitution made it a felony to insert this clause in a mortgage and imposed a tax of two per cent. on mortgages, but capital protects itself in California as it does everywhere else; the rate of interest on mortgages has been advanced by the savings banks and other lenders two per cent. and the borrower pays the tax as he did before. The time is not far distant when the Northern Pacific railroad will make good all the early predictions of the enterprise. When its line was pushed to Bismarck, it ran through unoccupied lands; the road is now threaded with villages, and the number of passengers carried in the first quarters of 1877, 1878 and 1879 has nearly doubled in each succeeding year, beginning with 4298 in '77, and reaching nearly 17,000 in '79. The sales of land along the line of the road by the railroad and government in 1878 amounted to 2,000,000 acres, and it probably reached 3,000,000 acres in the year ending June 30, 1879. The crop returns from 34 settlements show that this land averaged 32½ bushels of wheat to the acre and 42½ bushels of barley. The construction of the Northern Pacific is in progress this season at the rate of a mile a day, and is expected to reach the Yellowstone river in two years. Official returns of the census taken March 1 gives Kansas a population of 849,978.

The reports from the United States Consuls on the condition of labor in the several countries of Europe, which have been prepared for publication by the Department of State, show: 1. That wages in the United States are double those of Belgium, Denmark, France and England, three times those of Germany, Italy and Spain, and four times those of the Netherlands. 2. That the prices of the necessaries of life are lower in the United States, than in Europe, and that the laborer in the U. S., were he satisfied with the scanty and miserable fare upon which the European laborer lives, can purchase like food for less money than it can be purchased for in Europe. 3. That the French working people, with far less wages, are happier than the working people of Great Britain, who receive the highest wages in Europe, on account of the steadiness and the economical habits of the former, and the strikes, drinking habits and consequent recklessness of the latter. 4. That more misery results from strikes, drinking, socialism and communism in England and Germany than from all other causes combined, hard times included. A forthcoming report of the Commissioner of Agriculture will show that in the whole United States, except Minnesota, California, Colorado, Oregon, New Mexico and Washington Territory, the average monthly pay of farm laborers has declined during the year ending last April from three to fifteen per cent. At the same time the expenses of living in a majority of the States has declined in equal or greater proportion. In New-York alone,

farm laborers receive eight and three-quarter per cent. less than they did a year earlier, and pay ten per cent. less for their living. In New-England and the Middle States there seems to be a surplus of labor in certain localities and a deficiency in others, which should render the average demand about equal to the supply. The general rate of pay for skilled labor—shoemakers, blacksmiths, carpenters, etc.—is slowly rising, and is believed to indicate a return of better times for farm laborers.

This is the dullest season of the year for news, no Congress or legislature being in session here and most of the foreign legislative bodies having adjourned or dissolved, while the wealthy and well-known folks in general whose doings generally supply most of the "news" of the day are quiet at the watering places, the mountains or in Europe. Accordingly newspapers—live ones especially—are often nonplussed to fill their columns with readable matter, sometimes it is suspected that they invented items; and there's not a bit of doubt but that they grossly exaggerate. Hence a piece of scandal about well-known characters is at this season a delicious morsel to the newspaper press—one that they turn over and over in order to get all the flavor of it. Such a bit of good luck has just befallen them lately. Early last week there was a rumpus up at Narragansett Pier R. I. between ex-Senator and ex-Governor Sprague and Senator Conkling; and Mrs. Sprague, *nee* Kate Chase, daughter of the late Chief Justice, was the cause of the squabble. When Miss Chase caught Senator Sprague, she was thought to have won one of the richest men in the country and had a brilliant future before her. Four or five years ago Sprague Bros. "burst up," however, and since then their vast possessions have been in the hands of trustees. Since her husband's mishap Mrs. Sprague has lived chiefly near Washington, on an estate left her by her father, and for the last couple of years censorious tongues have been busy with her familiar relations with Senator Conkling. Lately she visited her husband's splendid place called Canonchet, near Narragansett Pier, R. I. Shortly after her arrival the ex-Governor made a business trip to this city and then to New Hampshire. During his absence Senator Conkling, at Mrs. Sprague's invitation, took up his residence at the mansion, together with several other invited guests, despite the fact that Mr. Sprague objected to the presence of visitors, on account of the expense, and was bitterly opposed to the presence of the New York Senator on account of the newspaper scandal at Washington. Sprague returned unexpectedly, late at night, retired to his own room and didn't learn of Conkling's presence till next afternoon, down at the village. He posted home at once, ordered the New York Senator out of the house, giving him a specified time to quit and swearing that if he remained longer he would blow the Senator's brains out. Conkling left without his luggage, which was packed after him. Sprague followed with a shot-gun to the village, and there told Conkling that should he ever cross his path again, he must do so armed, as he would kill him on sight. The reason he gave was that Conkling was trying to bring at Canonchet the same scandal on his family which he had already brought at Washington. Mrs. Sprague at first left home for a neighboring hotel, but on her husband insisting, next day, on taking charge of the children—a boy and two girls—she followed them to Canonchet and has stayed there since. She has been very free in giving her side of the affair to the public, but as she talks of Conkling in the highest strain while vilifying her husband, she has hardly benefited her case. There is talk of a separation or a divorce, while there are growing hopes of a compromise. There was a fellow called Lincke mixed up with the matter at first, but he's dropping out as a mere incident. The fellow was engaged as a tutor by Mrs. Sprague without the knowledge of her husband, and insisted on acting as such at Canonchet in spite of the strong objections of the latter.

The executive committee of the New York State Grange and the State Farmers' Alliance held a meeting in Syracuse on the afternoon of the 12th inst., which was presided over by L. H. Bishop, of Jefferson county, Chairman of the State Grange. The meeting was held for the purpose of arranging plans and preparing a programme for the State Convention of the Farmers' Alliance, which meets in that city August 20. It was decided to issue an address to the agricultural and industrial interests of the State, setting forth the grievances under which they labor and the measures that should be adopted to advance their interests. A committee consisting of W. J. Fowler, of Monroe, and W. A. Armstrong, of Chemung, was appointed to prepare and issue the address. They will present the address at the meeting of the Farmers' Alliance. A committee will also be appointed to present to the State conventions of both political parties the names of candidates for the nomination of Governor acceptable to the agricultural and industrial interests of the State on questions relating to railroad transportation, assessment and taxation. No man will be supported by the Alliance who is allied in any way with corporations or monopolies, or whose record is objectionable to the people of the State. The State Grange and the Farmers' Alliance will co-operate with the Board of Trade and Transportation of New York City in its efforts to render legislation less in the interest of corporations. The delegates present declared that in the event of either the Republican or Democratic convention nominating a candidate selected by the Farmers' Alliance, and the other not doing so, the farmers will heartily support the candidate nominated, independent of past party affiliations. They claim that a vast majority of the farmers in the State of New York are either members of or are in sympathy with the Farmers' Alliance, and that they are all determined to stand by each other and follow out this programme. Every grange, town or county alliance, farmers' club or other agricultural society is expected to send delegates to next Wednesday's convention. The State Alliance is composed of delegates from the farmers' organizations of this State, but, by a resolution adopted at its last meeting, all farmers and others favoring the reforms which it asks are invited to attend and take part in its discussions.

FOREIGN.

Bosna-Seraï or Serayebo, the capital of Bosnia, has been visited by a very destructive fire, destroying 1,000 buildings, including the Catholic and Servian churches. Twenty thousand persons are homeless, and the loss is enormous. Holland exports annually 61,000,000 pounds of cheese, and 32,000,000 pounds of butter—an amount which seems truly remarkable for a country of so small extent. The abundant milking properties of the Holland cattle explains this large exportation of dairy products. The London Sporting Life says, that 44 contestants have already entered for the pedestrian match for the Astley belt at Gilmore's garden, New York, September 22.

An American, Colonel Gordon, has for some years been waging a bitter war against the slave dealers of Central Africa, on behalf of Egypt, and at the same time extending the territory of the latter country. He is now Governor-general of Southern Egypt and the latest news from there is dated June 14. It shows that after his Lieutenant, Gessi, had conquered the slave dealers of the Bargazelle district, killing eight of their leaders in battle, taking their chief station by assault, capturing a very large amount of booty and hanging nine of their ring leaders as a warning, he proposed to evacuate the district, after disarming the inhabitants. Upon this plan, the operations to check the slave trade would be confined to rigorously watching privateers and encouraging legitimate commerce. Sulliman, the herder of slaves, who escaped after the last battle, has mustered a force and is pushing for Darfur, where he will find an abundance of discontented spirits to join him. Col. Gordon thought the situation so serious that he hastily returned to Darfur.

There is a serious difficulty in Quebec between French Canadian and Irish Catholic ship laborers. The trouble originated in a split in the Ship Laborers' union, but has now assumed the character of a war of races. A bloody collision occurred on Friday between the two factions in which one was killed and many wounded. Since then the military have been called out and parade the streets, but fights still continue between small parties of the rival factions. The department of agriculture's August returns show a slight decline from the condition in July for cotton. The average condition for the whole country is 91, or a loss of two per cent. since July 1. The condition of spring wheat is 82 against 75 in August of last year. The northern parts of New England and New York have maintained their July condition. The condition of the oat crop is 91 against 100 in August of last year—a slight improvement over the July condition.

The pleasure of bathing is greatly increased by mixing in the tub half or even a quarter of a bottle of MURRAY & LANMAN'S FLORIDA WATER. Instantly the whole atmosphere of the bath-room is as fragrant as a blooming flower-garden, the mind becomes buoyant, and the body emerges refreshed and strengthened.

Hop Bitters strengthens, builds up and cures continually, from the first dose.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, August 16, 1879.

BEANS AND PEAS.—Marrow beans dull and lower; exports light, 572 pkgs for week. Mediums sell mainly at inside prices: extras, however, held firm. White kidneys neglected. Pea beans scarce and strong for choice. $1.20@1.35. Red kidneys quiet; buyers will not take many at present prices. Black or turtle soup beans scarce and firm, $2.40@2.50. Canadian peas, in bulk and bond, are the only quotable peas, 70@72c. Beans, marrow, prime, $1.35@1.37½; fair to good, $1.17½@1.22½; medium prime, $1.3@1.32½; fair to good, $1.25@1.27½; red kidney, prime, $2.40@2.50; fair to good, $2.20@2.30.

BEESWAX.—For ordinary prime lots 23c is the best price; there are some choice lots held at 24c.

BROOM CORN.—There is a very good sale and firm prices.

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 4@5c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Receipts for the week, 32,450 pkgs. Exports, 6,700 do. There is no animation to be noted. High grades have an increased demand. Buyers who could recently fill out their wants from useful sound sweet late made or from stock taken out of cold storage, are now forced to look at creamery and special pails and ½ tubs to supply best wants. This addition to the regular current demand for fancy, has sent up prices. There is an abundance of stock waiting a price from shippers or any other class of round buyers, and many of our lower ranges are almost nominal.

State pails and half tubs, choice, 15@15½c.; good to prime, 14@14½c.; fair to good, 12@14c.; firkins, yellow, 14@15c.; Welsh, good to choice, 14@15c.; fair, 12@13c.; poor State, 8@9c; State creamery, choice, 17½@18c.; good to prime, 16@16c.; fair to good, 15@16c.; sweet cream, 16@17c.; Western creamery, choice, 17@18c.; other, 15@17c.; imitation, 10@15c.; Western dairy, best, 12@13c; fair to prime, 9@10c; factory, choice, 10@11c.; other, 7@9c.; poor, 6@6½c.; grease butter, 4@5c.

CHEESE.—The week's business opened with a confident feeling, with the basis in the prices ruling in the country, with up to 5½c. and even 6c. made for special lots, our trade dragged and shippers being very indifferent, and at the close 5½@5½c. are the quoted rates on fancy, the higher price seldom made. Anything at 1½c. and under is quick.

Quotations for State factory: Fancy, 5½@5½c.; good to prime, 5@5½c; fair to good, at 4½@5c.; half-skimmed, 3@4c.; skimmed, 2@3c.; State farm dairy: Fine, 5½@5½c.; good to prime, 4½@5c.; fair to good, 4@4½c.; skimmed, 2@3c. Wisconsin factory: Fine, at 5½@5½c.; good to prime, 4½@5c. Ohio factory: Cheddar, fine, 5½c.; do., fair to good, 4½@4½c.; full cream, flat, fine, 5½c.; flat, good to prime, 5½@5½c; flat, fair to good, 3½@4½c.; half-skimmed, 3@4c.; skimmed, 2@3c.

Liverpool cable, 30s., showing a steady decline for the week.

Steam to Liverpool, 40@45s.

Exports, 58,600 boxes.

COTTON—Has been active and closed steady at for August, 11.28@11.30c.; September, 11.25c.; October, 10.37@10.38c.; November, 10.18@10.19c.; December, 10.17@10.18c.; January, 10.25@10.26c.; February, 10.36@10.38c; March, 10.47@10.49c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—New peeled peaches are wanted, and only about 30 bbls. have thus far been received; old peeled peaches are in demand and firm. Apples have a good sale.

Patent evaporated apples, choice, in cases, at 11c.; do. fair to good at 9@10c.; N. Y. State sliced, choice, at 4¾@5¼c.; do., quarters, choice, 4@4½c.; western quarters, bright, at 3½@4c.; common and old at 2@3c.; N. C. peeled peaches at 9@10c.; do. Georgia, 7@8c. for old and 10@11c. for new; unpeeled halves at 3@3½c.; do quarters at 2½@3c. Blackberries at 5½c. Raspberries at 27@28c. New York State plums at 8@10c New pitted cherries, wet, at 13½@14c.; dry at 15@15½c.

EGGS.—Receipts for week, 5,443 bbls.; do., last week, 5,575 do. The market is in better shape and prices respond to a rather better demand, and a decided improvement in quality of Western, with higher prices.

Near points, 15@16c.; State and Penn., 14½c.; choice Western and Canadian, 13½@14c.; inferior, 12@13c.

FLOUR.—Receipts are large, and they are freely offered at lower prices.

Latest prices are: $3.30@4.00 for very inferior to choice superfine state; $4.15@4.40 for poor to good extra do., odd lots and lines; $4.40@4.75 for good to very choice do.; $3.30@4.00 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $4.10@4.40 for inferior to very good shipping extra do., and $4.40@4.75 for good to very choice extra do.; common to choice white wheat extras, $4.60@5.00 choice to strictly fancy do. at $5.00@6.70; red and amber winter wheat, inferior to very choice trade and family, at $4.40@5.75; round hoop Ohio at $4.25@4.65, and trade and family brands of do. at $4.75@5.85, the latter rate for very choice; St. Louis, $4.00@5.10 for inferior to very good extra; $5.50@6.50 for very good to very choice; Minn. clear, very inferior to very fancy, at $4.10@5.00; do. "straight," very inferior to very fancy, at $4.85@6.50, and patent poor to very choice fancy at $5.40@7.50; unsound stocks at from $2.25@2.50, city mill extra at $5.15@5.45, fair to choice, for West Indies; do. for England, $4.10@4.40; do. trade and family extras, $5.65@6.50; do. for South America $5.50@5.75 for standard to choice brands (winter wheat product); No. 2 at $3.10@3.25 for very inferior to very choice.

FRESH FRUITS.—The market is well supplied with miscellaneous fruits, but at this season apples and pears are more or less mixed with irregular qualities. Parcels of uniform grade show some steadiness, but everything gives way more or less to peaches. These have had a pretty paying market for growers, but to-day's supply met a bad market, owing to a large supply of 55,000 baskets, which arrived in a rain-storm. Since Aug. 1st, 433,000 baskets have come to N. Y. city, and about 70,000 baskets have gone direct Eastward. Crates during the week have sold at 80c.@$1.25; extras, $1.50, and baskets 60c.@$1. To-day prices are very unsettled, baskets in the morning, 40@70c.; crates, 60c.@$1; variety, Yorks, Crawfords and Old Mixons.

Apples, red Astrachan up-river, ₱ bbl., $2.50@2.75; do., Jersey, $1.50@2; Nyack Pippin, $2; Orange, do., $1.25@1.75; Sour Bough, $1.00@1.50; Sweet do., $1@1.50 Cranberry Pippin, $2.00@2.75, Catherine pears, good to prime, per bbl., $1.50@1.75; Bloodgood, fair to prime, $2@2.50; Bell, fair to prime, $1.25@1.75; Bullum, $1.50@1.75; Bartlett, Southern, extra, per crate, $1.75@2; poor, $1@1.50; up-river, per bbl $3@5; New Jersey, $2@4.50; cooking, per bbl., $1@1.50 Hot-house grapes, 60@75c. for ₱, Hamburg and 30@40c. for Sweet Water. Ives, per 24 lb. case, $1.50@3; Concord, $3.25@3.50. Plums, up-river, Egg, per bbl., $1@3; Horse, $3.50@4; Md. and Del., blue, ₱ bushel, $1.25@1.50. Whortleberries, Jersey, 6c., per 16 qt. box, 50@75c.; do. mountain, 75c.@$1. Watermelons, Jersey Black Spanish, ₱ 100, $8@14; Nonticoke, prime $12@15; Norfolk, do., $6@10; N. C., $5@10; culls, $3@6. Nutmeg melons, Cantaloupe, Monmouth Co., ₱ bbl., $2@2.50; do., S. Jersey, $1.25@1.50; do., Jenny Lind, 75c@1.25. Peanuts firm and in demand; only fair quality lots offering; Va. hand-picked, $1.50@1.55; fancy, $1.4; extra prime, $1.30; good to prime, $1.20@1.27½; shelled, per lb., 5½@6c.

GRAIN.—Wheat, on the crop prospects, has declined, but has been active; latest sales are of No. 1 amber at $1.09@1.09½; No. 2 amber at $1.08@1.08½ do, August option, at $1.08½; do., September option, at $1.08; ungraded amber at $1@1.08½; mixed winter at $1.07@1.07½; extra white at $1.11½; No. 1 white at $1.10½@1.11; do., August option, at $1.10½; do., September option, at $1.10@1.10½; do., steamer grade, at 31@9; No. 2 white at $1.08½@1.08½; ungraded white at $1@1.10; No. 1 red at $1.09@1.09½; No. 2 red at $1.08½@1.09½; do, August option, at $1.08½; do., September option, at $1.08½; do. October option, at 1.09@1.09½; No. 3 red at $1.06½@1.07, ungraded red at 97½c.@$1.08½; New York No. 2 spring, at $1; No. 3 spring at 90c.; No. 4 spring, at 83c.; rejected spring at 73c; ungraded spring at 85@90c. Rye at 63@64c. for Western and 68c. for State. Corn closed with weak prices and a fair export trade. Sales of New York No. 2 at 46½@46¾c. do. August at 46½c. do. September at 47c.; do. October at 48c.; New York steamer mixed at 46@46½c.; do. August at 46c. bid and 46½c. asked; do. September, at 47c. asked; do. October at 47c. asked; ungraded Western mixed at 45½@47c.; No. 2 white at 50c.; round yellow at 50c. asked; yellow Western at 48@48½c.; yellow Southern at 49c. Oats are active; sales of New York No. 1 white at 41c.; New York No. 2 white at 39½c; New York No. 3 white at 38½c.; No. 1 at 38½@38c.; No. 2 at 38@38½c.; No. 3 at 37@37½c.; rejected 36@36½c; mixed Western at 29½@33½c.; white do at 35@40c.; white State at 37@41c.; mixed State at 35½@36½c.; No. 2 Chicago quoted at 35½@36½c.

HAY AND STRAW.—Receipts are liberal but demand is good and prices sustained.

New hay is at 50c. for shipping; 70@80c. for prime, and 55@60c. for medium. Old hay at 50c. for shipping and 70@85c. for prime retail qualities; medium at 50@55c. Straw at 50@60c. for long rye, 45c. for short rye, and oat at 50@55c.

HONEY.—Dealers regard 10@12c. as opening prices for new. The cheap season of last year does not encourage prompt shipments.

HOPS.—There is no new feature to report. A steady demand continues, both for home use and for export, at unchanged prices. The London market is reported firm, with less business doing; their crop is estimated at £150,000 to £175,000, old duty. Cable advices received on 14th report good weather for past two weeks.

	Bales.
Receipts for the week	2,734
Total receipts since September 1, 1878	90,100
Total receipts for same period in 1877	137,330
Export clearances for the week	545
Total exports since September 1, 1878	73,063
Total exports for same period in 1877	78,349

Quotations are for New York's, new crop, prime choice, 15@19c.; New York's, new crop, medium, 10, 12; New York s, new crop, low to fair, 7@9; Eastern, 8@12 Western, 8@11; Yearlings, 4@10, Olds, all growths, 3@5 Pacific coast, nominal, 10@16.

OIL-CAKE.—Western is quoted $28 per ton.

SEED.—Grass is firm, with clover quoted at 6¾@7¾c. for Western and timothy at $1.70@1.75.

POULTRY AND GAME.—With moderate receipts, prices have been fairly supported There is no room at this season for new shippers. Light days can be filled up by city killers, and by these parties the best country dressed is closely imitated in style. Turkeys, Phila., dry-picked, 16c., State and Western, 13@16c.; chickens, Philadelphia, per lb, 16@19c.; State, 15@16c.; Western, 13@15c.; fowls, choice, ₱ lb., 13@14c. other, 11@12c.; dry-picked, 15c.; ducks, spring, dry-picked, 12@16c.; other, 11@12c.

Cooped stock is in good supply, and fowls must be prime and weighty to command outside rates. Chickens have declined 1c. since our last. Geese scarce and firm.

Chickens, large per lb., 13¼@14c.; small, 11@12½c.; fowls, N. J., 11c.; Western, 10@11c.; Southern, 9@10c.; roosters, old, 5@6c.; ducks, ₱ pair, 40@70c.; geese, best, $1.50@1.75; others, $1.12@1.37.

Woodcock are plenty and in fair demand. Snipe are unusually scarce this season. Western, pair, 60@65c. State, do., 70@75c.; dark tame squab, $1@1.25; white, $1.75.

PROVISIONS—Have been more active and tending upward, chiefly on speculative manipulation; mess pork quoted for August, $8.75@8.80; September, $8.75@8.80; October, $8.85; November at $8.80@8.90 for seller's option, old or new. Bacon at 5c. for long clear and 5¼c. for short clear. Lard, Western steam, at 5c. for spot lots, $5.97½@6 for Aug. & Sept; $6@6.02½ for October. Stearine at 6¾@6¾c. for Western. Tallow at 5¾c. for prime. Beef hams at $18@18.50.

TOBACCO.—There is a better business and firm prices.

WOOL—has become rather firmer, with increased trading. X and XX Ohio fleeces quoted 37½@ 8c.; Colorado at 17½@24c.; spring California at 20@27c.; spring Texas at 18@28c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 16.

BEEVES.—Receipts for the week, 12,981 head; do. last week, 11,845 do. Monday and Wednesday last were good days for cattle, but the closing market was weak and discouraging in the bulk of sales. Trains containing nearly one-third of the total for the week, arrived at mid-day, and buyers, of course, could dictate, and it is not necessary to add they did. Medium to fair steers were rated ½c lower and coarse natives and Texans ½c. do; common to fair natives quoted, 3@c. to dress 55@56 lbs.; good to choice, 9¾@10¼c., dress 55@57 lbs. Texans, 6¾@7¼c., dress 55 lbs.; Colorado, 7¼c., dress 55 lbs.

COWS AND CALVES.—Supplies accumulate at the yards since the authorities prevent sales at scattered points such as barges and wharves. This fact has something to do with reducing the range of prices; $35@50 is reported as a scale for fair to good milkers.

VEAL CALVES.—Supplies exceed the demand, and prices for all grades are easy. N. Y. and Buck's Co. choice, 5¾c; good to prime do and State, 5@5½c.; poor, 3@4¼c.; grassers and buttermilk, 2@3c.

SHEEP AND LAMBS.—Receipts for the week, 31,213 head; do. last week, 26,150 do. Sales have been fairly active, but owing to late arrivals yesterday, the market closed weaker and lower than for the previous two or three days. Sheep ranged at $4.50@5.35 ₱ 100 lbs. common to prime. Lambs, ordinary to extra, 5@6¼c.

HOGS.—Receipts for the week, 17,657 head; do. last week, 19,569 do. With continued moderate receipts the market is strong. Good quality, 160 lbs. to 200 lbs. weight, 4¼@4½c., with sales of Ohio at the close, city dressed, 5¼@5¾c.; pigs, 5¼c.

AN ORATOR'S LAST WORDS.

BRILLIANT and eloquent, S. S. Prentiss was the idolized lawyer of the Southwest. A Maine boy, he made himself a place in the hearts of those who liked not the Yankees. His genius fascinated, and his genial manners won them, in spite of their prejudices.

He might have been their political leader, but a brief experience in Congress so disgusted him with practical politics that he refused its honors. A fortune awaited him, but he turned from it, because he would not abandon social pleasures, nor practice self-denial. At last he resolved to work himself out of debt, and provide for the education of his children.

"I must work!" he said to those who had advised rest, because they saw that his good resolution had come too late. The spirit was now willing, but the body, enfeebled by disease and dissipation, refused to obey its commands.

"Why, good sirs, a man cannot lie in bed and make his living," he answered, to friends who bade him leave New Orleans and rest on a plantation.

Nerving himself, he appeared in a case which drew out the culture of the city to hear him. Never was he more brilliant in wit and eloquence. He did not know, but his friends did, that it was the swan's death-song. They shaded their eyes, for they saw that the vigor of the intellect made more apparent the decay of the body.

"Take me home," he whispered to a friend, when recovering from the prostration in which his eloquent plea had left him. He was borne home on a river-boat—to die.

On the night of the arrival, the family smiled mournfully to see his old self return.

"Gather me half a bushel of roses with the dew on," he said to a relative. "Put them in a basin and stand it by my bed," was the remark, as the roses were brought in.

During his illness the thought that he was leaving his family destitute made him talk much about suits and raising money. Now and then the great orator became a boy again, and wandered to his Maine home.

"Dear mother, do you love me?" repeated again and again, showed that her teachings and prayers were in his mind.

In the hours of consciousness he was much distressed at the idea of death. Mary, his pious wife, urged him to trust in the Savior.

"You do not know how wicked I have been. God will never forgive me," he replied.

"'Though your sins be as scarlet, they shall be as white as snow,'" replied the wife, "if you will but turn to the Lord.

"Pray, dear. Wont you pray? Don't you remember the prayers your mother taught you?" she continued.

"Oh, yes but I want you to pray with me."

She repeated the Lord's Prayer, he responding at each petition, "Amen!"

"O God, the Son!" she heard him whisper, as if striving to recall the petition of the Litany, "O God, the Son, Redeemer of the World, have mercy upon us miserable sinners!"

On a Sabbath evening the wife was busy in the room, his eyes wistfully following her. "Mary!" she heard, and hastening to him, received an embrace and a kiss. It was the last word uttered on earth by the eloquent advocate.

One solemn thought is suggested. No words uttered by the orator in moments of highest inspiration, were so treasured as those whispered "Aineus," and that sighed-out "O God, the Son!" they were words of penitence.

His imagination in its uttermost wanderings never brought back a scene which thrilled as did the "Dear, dear mother, do you love me?"

It revealed the boy at his mother's knee, and suggested the hope that at last he received the Savior as a little child.—*Youth's Companion.*

THE FLOWER.

SUFFICIENT time has now elapsed since we had the lesson on leaves to have that lesson fully learned, and I hope that all of my nieces and nephews, who were at all interested in the subject, cannot only discriminate between a compound and a single leaf, between a palmate and a pinnate, but that they can name the different parts and forms at sight. In this lesson I will talk about the flower which is, if possible, a still more interesting subject than the leaf. It is more interesting, not simply because nature has so lavishly adorned it with beauty of form and color, and made it so attractive by its fragrance, but also because of its delicate and wonderful structure, and by reason of the very important office it has to perform.

The object of the flower is to produce seed; and as the seed is the means of perpetuating the plant,

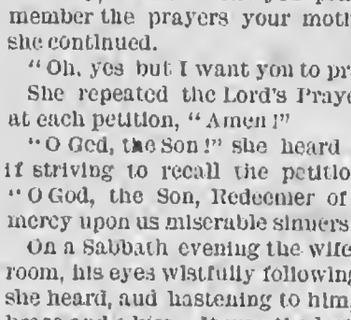

FIG. 1.

so that when one tree dies another springs up to take its place, thus constantly keeping the earth green and flourishing, the importance of the flower as a part of the plant will readily be understood. If you take a rosebud, just before it expands into a full-blown rose, and pick it to pieces, you will first find some little green leaves which inclose everything else in the bud; next comes another set of delicate leaves, more or less colored, which are the rose petals or leaves of the flower, and inside are some little thread-like organs called stamens and pistils. These four sets of organs constitute

The Parts of a Flower.

In Figure 1, which represents a flower of the Stone Crop family, these organs may all be seen, arranged in circles one inside or above the other; and in Figure 2 is seen a diagram of the same flower. In both figures the *sepals*, or the parts of the outer circle, are marked a. All the sepals taken together are called the *calyx* of the flower, calyx being a Latin word meaning

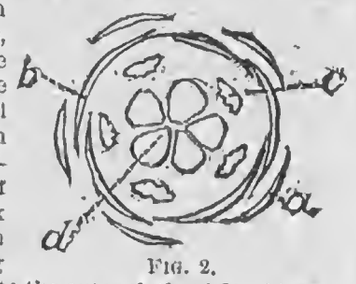

FIG. 2.

cup, and applied to the outer circle of floral leaves, because it forms a cup in which the other parts of the flower are contained. As a rule the calyx is of a green color, but there are exceptions to this rule, as may be seen in the Fuchsia in which the calyx is highly colored and adds much beauty to the flower. The office of the calyx is to protect the more tender parts in the bud. The next circle of floral leaves is called

The Corolla,

which term is derived from the Latin corona, meaning garland or crown. The corolla is generally colored and forms the most showy part of the flower. Each separate leaf of the corolla is called a *petal*, and in figures 1 and 2 these are marked b. The office of this circle of leaves is to envelope and protect the organs within, and for this reason the calyx and corolla, taken together, are called the *floral envelopes*. The *essential organs* of the flower likewise occupy two circles, one within the other. The first of these circles consists of

The Stamens,

which in figures 1 and 2 are marked c. At fig. 3 is shown a separate stamen. It consists of a stalk, a, called the *filament*, and the rounded body at the top termed the *anther*, b. When the anther has matured it splits open and discharges a fine dust termed the *pollen*. Viewed under a microscope the pollen is seen to consist of very minute grains of definite size and shape, and often very curiously and beautifully marked with bands and stripes. A flower that has stamens but no pistils cannot produce seed, and is called a *staminate* or *sterile* flower.

FIG. 3.

The Pistils

occupy the innermost of the four circles in a flower. In figures 1 and 2 they are marked d, and in figure 4 is shown an enlarged pistil from the same flower. It consists of three parts, the *stigma*, s, which is the place designated to receive the pollen, in order to bring about fertilization, the *style*, t, which is an open tube leading down to the *ovary* or cavity containing the embryo seeds called the *ovules*, seen at o. A flower that has stamens but no pistils, is said to be pistillate. A still better idea of the four circles in the flower may be had from the ideal plant in figure 5, where the calyx, corolla and stamens are represented as separated.

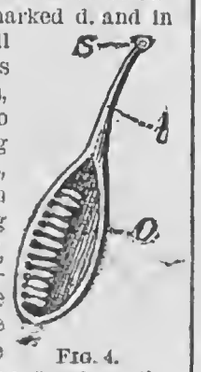

FIG. 4.

Such is a brief description of the organs that go to make up the flower. But some of these organs may be wanting, or they may be so modified in form and position, as to make a material difference in the appearance of flowers, and it is upon these differences, to a great extent, that the classification of plants is based.

Figure 1 has all the parts, an equal number of each, that is, five sepals, five petals, five stamens and five pistils, each set of these has the parts all of the same size and shape, and, as seen from figure 2, they alternate with one another in regular order, one petal standing opposite the opening of two sepals, and so on; it is therefore called a *typical* or *pattern* flower.

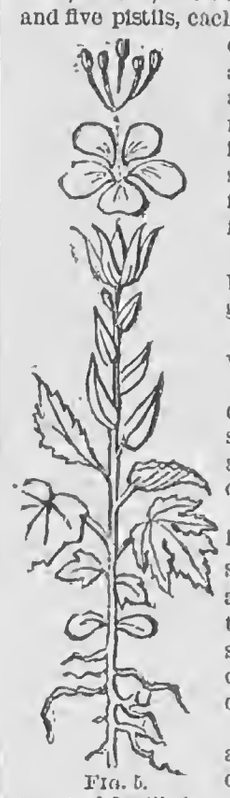

FIG. 5.

A *perfect* flower is one that has both kinds of essential organs, viz., stamens and pistils.

A *complete* flower is provided with the four circles of organs.

A *regular* flower has all the organs of each set alike, for instance, the petals should all be alike, and so with each of the others.

Irregular flowers are those in which the parts of the same set of organs differ from one another. This is the case with the petals in the Pea, the Pansy, the Larkspur and many others, thereby giving them a one-sided and irregular shape.

A great deal may yet be said about the flower, but this I consider sufficient for one lesson, and I will therefore bring it to a close. I hope that all of the cousins interested in botany, and especially the members of the Horticultural Club will examine a large number of flowers and see the parts for themselves, apply the names, and thus commit them to memory. Botany is a science that everybody ought to understand, and, certainly, all who live in the country where there is no want of opportunity to study. Some other time I will give another lesson on the same subject.

UNCLE MARK.

LETTERS FROM BOYS AND GIRLS.

GOOD-MORNING, COUSINS!—How do you do? Did I scare you? My, how you all jumped. Why do you keep so quiet? Now since I have joined the circle of cousins, I mean to stir you up. Who is that dozing over there in the corner? Please to introdnce him, Miss Madcap Mollie. *Listen*, "Make you acquainted with Miss Dolly Varden, Mr. Slayer-of-conceit." Well, I think if I had known that was your name, I would let you go on with your dreaming. Lilie Lee, how do you do? Glad to see you, Wild Cherry, Dewdrop, Snowdrop, Ivy, Bob White, Young Bach. Come, open your eyes, summer is nearly over and fall will soon be here. It is time we heard from you. Do you hear me? Ah, you are dozing too comfortably to take an active interest in our letters. Good-by,

Cross Creek Village, Pa. DOLLY VARDEN.

DEAR UNCLE MARK:—My garden has not done quite as well this summer as it would, for the chickens scratched up part of it. Then my peanuts did not come up, but my lettuce and radishes grew finely. I was sick when the first package of seed came, so mamma planted some of the peppers and tomatoes and egg-plant seed, but none of the egg-plant seed came up. I planted some of the melons and cucumbers, so I have some of each kind growing. We think those white-tailed radishes are excellent. We received the corn the 5th of July and we planted it the same day, putting two grains in a hill and the hills about two feet apart. It is up now and growing nicely. Accept my thanks for all those seeds. Respectfully,

Clermont Co., O. ROSA E. ABBOTT.

DEAR UNCLE MARK:—Please let me say a few words. I am 11 years old to-day, and I did not get any presents, which I think is too bad. I would like to join the Horticultural Club. I have a little garden of my own, in which are Honeysuckles, Bridal Feather, Lilies and Pinks. I like flowers very much. If I see this printed, I will write again. FANNY HORNE.

Wolfe Island, Ontario.

[I sympathize with you, Fanny, in your disappointment. Yet you should not take it much to heart. A present should be cherished for the love the giver bears you, and not for its money value; and though your friends did not give you any presents, you may be assured that they think none the less of you.—U. M.]

DEAR UNCLE MARK:—Will you please register J. Connie Plummer's name on the Horticultural Club list. I have some experience in cultivating flowers, vegetables and melons, which I hope will prove recommendation enough, and you will favor me with some seeds, remembering that my home is in the extreme south of the United States. The fall is the most favorable season for gardening here. I proposed to my sister to join, but she thought that the name of one of us was sufficient. From your little niece,

JULIA CONNIE PLUMMER.

Refugio Co., Texas.

The Puzzler.

PRIZE PUZZLE.

WE have a few books on hand in the office, which, so far as they go, we will present to those *cousins* who, in the next two weeks, from August 23d to September 6th, shall send us the correct solution of the following puzzle in verse.

Come, let us look at it closely—
It's a very ugly word,
And one that makes me shudder
Whenever it is heard.
It may not be always wicked;
It must be always sad,
And speaks of sin and suffering
Enough to make one mad.

They say it is a compound word,
And that is very true;
And then they decompose it,
And that they're free to do.
If of the dozen letters
We take off the first three,
We have the nine remaining
As sad as sad can be—
For though it seems to make it less,
In fact, it makes it more;
For it takes the brute creation in
That was left out before.

Instead of three and nine,
Let us make it four and eight;
You'll say it makes no difference—
At least, none very great.
But only see the consequence—
'Tis all that needs be done
To change this mass of sadness
To unmitigated fun.

It clears swords and pistols,
Revolvers, bowie-knives,
And all those horrid weapons
By which men lose their lives.
It wakes nations' voices;
And now most joyfully is heard
The native sound of gladness
Compressed into one word.

Yes, four and eight, my friends,
Let that be yours and mine;
For all the hosts of demons
Rejoice in three and nine.

A HALF WORD SQUARE.

A man's name. A river of England. A field. Two consonants. A consonant.

☞ Answer in two weeks. L. O.

PUZZLER ANSWERS.—July 26.

HIDDEN TOOLS.—1. Trowel; 2. Wrench; 3. Pinchers; 4. Bit; 5. Nippers; 6. Ruler; 7. Gavel; 8. Steelyards; 9. Axle; 10. Hatchet; 11. Hoe; 12. Rake; 13. Chisel; 14. Screwdriver; 15. Compass; 16. Jackplane; 17. Plummet; 18. Punch; 19. Padlock; 20. Port-crayon; 21. Burin; 22. Wedge; 23. Windlass; 24. Lever; 25. Vise.

ACROSTICAL ENIGMA.—Uncle Mark.

Sabbath Reading.

THE TONGUE INSTRUCTED.

GUARD well thy lips; none, none can know — Prov. xiii. 3.
What evils from the tongue may flow; — James iii. 5, 6.
What guilt, what grief may be incurred, — Judges xi. 35.
By one incautious, hasty word. — Mark vi. 22, 27.
Be "slow to speak," look well within, — Prov. x. 19.
To check what there may lead to sin; — James i. 26.
And pray unceasingly for aid, — Col. iv. 2.
Lest unawares, thou be betrayed. — Luke xxi. 34.
"Condemn not, judge not,"—not to man — James iv. 2.
Is given his brother's faults to scan; — 1 Cor. iv. 5.
One task is thine, and one alone,— — Matt. vii. 3.
To search out and subdue thine own. — John viii. 7.
Indulge no murmuring, oh, restrain — 1 Cor. x. 10.
Those lips, so ready to complain: — Lam. iii. 22.
And if they can be numbered, count — Ps. ciii. 2.
Of one day's mercies, the amount. — Lam. iii, 23.
Shun vain discussions, trifling themes; — Titus iii. 9.
Dwell not on earthly hopes and schemes; — Deut. vi. 4-7.
Let words of wisdom, meekness, love, — James iii. 13.
Thy heart's true renovation prove. — Luke vi. 45.
Set God before thee; every word — Gen. xvii. 1.
Thy lips pronounce, by him is heard; — Ps. cxxxix. 4.
Oh, could'st thou realize this thought, — Matt. xii. 36.
What care, what caution would be taught! — Luke xii. 3.
"The time is short," this day may be — 1 Cor. vii. 29.
The very last assigned to thee; — Eph. v. 16.
So speak, that should'st thou ne'er speak more, — Col. iv. 6.
Thou may'st not this day's words deplore. — Rom. xiv. 12.

THE STILL HOUR.

To do justly, to love mercy, and to walk humbly before God are, according to a high authority, the three essentials of the highest life. Of these the first is the hardest to practice. It is often easier to be generous than to be just; easier to show men favors than to recognize and respect their rights. But when we do turn from the gracious to the legal mood, trying to be just, we are apt to be very careful lest we yield to others any more than of right belongs to them. This is the characteristic of many men who take pride in being just, and who in spite of this honest scruple are soundly hated; they are always bound that nobody shall get from them anything more than even measure; and in this exacting spirit they not seldom pervert the justice on which they are intent. "If people calculate the judicial mean too nicely," says a great writer, "they will not hit it; in their hearts they ought to go a little beyond it or they will fall short of it." The only kind of justice whose company we can afford to keep is the justice whose handmaid is sweet charity—the justice that would give a man a penny more than his due rather than give him a farthing less.

THE mercy that we are bidden to love, is not mere lenity toward offenders but the good-will which is the fulfilling of the law. This is the quality with which justice must always be tempered. So far as conduct goes, the man in whose heart this good-will rules, and in whose life it finds expression, is blameless. God has nothing more to require of the man who in word and deed obeys the royal law. But it is not perfunctory beneficence that is here enjoined; it is not the mere doing of useful and kindly deeds; it is what Tennyson calls "the love of love." "To do justly and to *love* mercy" is what thy God requireth of thee.

"To walk humbly with thy God" is the last, and not the least of these requirements. The laws of conduct are summed up in the injunction to do justly and love mercy; but the habit of thought which is here enjoined is one of the crowning attributes of the highest virtue. There is a justice that is haughty and there is a beneficence that is ostentatious; the true glory of life is only seen where a genuine humility abides. And yet we do well to remember what Dr. Sears has so well said, that "humility is not humiliation nor self-disparagement. It is simply rendering to the Lord what belongs to him, instead of claiming it as our own. We are the most humble when we think least of ourselves, or put ourselves out of the account altogether, and let the Lord shine through us with his uncolored sunlight, without staining it with our own selfhood."—*Sunday Afternoon.*

PRAYER in the morning is the key that opens to us God's mercies and blessings. Prayer in the evening is the key that shuts us up under his protection and safe-guard.

THE most glittering services of unregenerate persons are but dead works, because they proceed not from a principle of life.—*Brooks.*

THOSE are the best Christians who are more careful to reform themselves than to censure others.—*Fuller*

PERSONAL ITEMS.

"The English eat half their words. If I imitate them I shall get fat," says Sarah Bernhardt, the thin.

The Christian Herald is responsible for the discovery that Prince Jerome Napoleon is the Beast of the Revelation whose number is 666.

A portrait of the Rev. John A. Simpson, for many years pastor of a Universalist church at East Cambridge, Mass., has been placed in the Boston Rogues' Gallery. He is in jail on a charge of horse stealing.

General Grant has taken passage in the steamer City of Tokio and will sail from Yokohama for San Francisco on the 25th or 26th inst. He is expected to arrive in San Francisco somewhere between September 12 and 15.

Capt. Joseph Boyle, of the Mississippi steamboat Heroine, stepped ashore at Mandeville, La., and was instantly killed by a negro whom he once whipped. The Heroine, on the return trip, brought an excursion party of lynchers, waited while they hanged the negro, and then carried them back home.

Burglars awoke Farmer Plummer, at Durham, Me., and he chased them, losing no time in adding any clothing to the shirt in which he had slept, but taking care to throw a gun across his shoulder. Across fields and through a village he pursued them, until he got within close range, when they surrendered rather than be shot.

The marriage of the Earl of Loudoun to Alice Howard mixes relationships considerably, as will be seen by the following: "Miss Howard is first cousin to the Duke of Norfolk, whose wife is sister to the Earl of Loudoun, and Miss Howard's elder sister is married to Lord Bute, who is cousin to Lord Loudoun, through his mother, Lady Sophia Hastings."

Capt. Stone planted a mahogany seed at Moundsville, W. Va., thirty-five years ago, and remarked that he would live until it grew into a tree big enough to provide material for his coffin. Wind blew the tree down last spring, and the Captain had a handsome coffin made of it. He died a few days ago, and was buried in the mahogany of his own planting.

Mrs. W. G. Venson, who gave Texas "the Lone Star," died at Crawford, in that State, last Wednesday. She made a beautiful flag, with a large, single star, in the summer of 1835 and presented it to Colonel Ward's command. The flag was of plain white silk, bearing an azure star of five points on both sides. It was first unfurled at Velasco on January 8, 1836, and being hoisted upon a liberty pole at Goliad, floated until Texas was declared free.

Mrs. Vliet, who lately died at New Albany, Ind., divided the mature part of her life into three distinct and contrasting periods. She was for ten years a washerwoman, working hard for a bare subsistence. Then she went into business as a fortune-teller, and for ten years was so successful that at the end of that time she was possessed of $100,000. Finally she became pious, and during her last ten years devoted her time and money to deeds of charity.

Opening out of the drawing-room in the Prince of Wales's seat at Sandringham is a small sitting-room fitted with bookcases. Beyond this is the Prince's own room, full of beautiful things. Here he and the Princess always breakfast, and here, on Nov. 9 and Dec. 1, are laid out the numerous birthday presents. A prettier room than the Princess's own was never seen. All the visitors' rooms are nearly perfect, and the servants' comforts are not neglected.

Oliver Bodlish, of Syracuse, aged 84, decided to marry for the third time, but he went about it deliberately. Remembering that a certain girl in his old Massachusetts home was very pretty fifty years ago, and being informed that she had lately become a widow, he made her a matrimonial proposition by mail, a condition being that she should still seem comely in his sight. He offered to pay her fare to Syracuse, and, if he did not like her looks, to send her back again. She made the journey, he was pleased with her, and they were married.

In the Chicago St. Vincent's Home for the Insane is a grave, quiet gentleman, who converses intelligently upon every-day topics, such as he finds discussed in the newspapers, and on religious subjects speaks with a wonderful precision of judgment. It is only when he tells visitors that he is the Catholic Bishop of Chicago that they doubt his sanity; yet his assertion is true. He is Bishop Dugan, whose reason was dethroned ten years ago. He has never been turned out of office, and still retains his episcopal signet ring, but is dressed in civilian costume.

The Rev. Josiah Hanman of Izard, Texas, was worried because his name was so much like Haman, and he studied the Bible story of Haman until he became insane on that subject. "Children," he exclaimed, in the midst of a sermon, "Haman was hung, as near as I can make a calculation, a little over 100 feet high. Now, children, I believe God wants me to give up my soul to him right away, and so take this rope and hang me 120 feet above the ground." This frightened the congregation so much that they ran away, and the preacher hurried into the woods, where he hanged himself.

A second sale of the effects of the unfortunate Earl of Lonsdale is announced. From being regarded as among the richest of English nobles, he has been compelled, only four years after attaining his majority, to dispose of his effects and part of the control of his estates. In the effects to be sold are included the magnificent tiara of diamonds, the marriage present to his bride, the beautiful Lady Gladys Herbert, which cost £13,000, besides the whole of the jewels considered as her ladyship's exclusive property. The devotion evinced by Lady Lonsdale under the circumstances forms the theme of admiration in the circles of high life.

The Emperor of Austria often drives with one of his equerries or the Crown Prince Rudolf—the late Archduke Franz Karl, his father, was often his companion at such times—to some little out-of-door *café*, a mile or two from Ischl, and sits for half an hour under the trees sipping his coffee and smoking his long Virginia cigar among the little throng of chance visitors. He is saluted with quiet respect, for the Austrians never mob royalty as an English crowd do. On Sundays the court attends mass at the village church of Ischl, and none more devout than his Catholic and apostolic majesty.

The news was carried to Bonay, Texas, that Hank Parsons had been murdered, at a place 20 miles distant, by a negro. Some of his friends immediately provided themselves with a rope, mounted their horses, rode to the jail where the prisoner was confined, and broke open the door. They had taken it for granted that the slayer was a man, and were astonished to find not only a woman, but one possessed of youth, striking beauty, and only enough negro blood to make her a quadroon. This presented a dilemma. Only a minority of the mob adhered to the original intention of lynching, and the woman was whipped and left alive for trial.

Lord Beaconsfield's gift of reading character has stood him in good stead in his selection of colleagues. It is to his credit that almost without exception he has been guided in his choice strictly by his convictions of a man's fitness for the post. There is much in his character and in his writings that would incline one to forecast that when his opportunity came he would surround himself with Dukes. It is a noticeable fact, however, that in a Conservative administration, formed in the high tide of Conservative power by the man who wrote "Lothair," the most important offices of the State are in the hands of commoners.

One of the Lynn newspapers received a letter purporting to come from the Rev. Samuel Lee and to give an account of the death of Ida Eddy. The matter, being interesting, was published in full. Miss Eddy walked into the office and indignantly denied that she was dead. The letter turned out to be a forgery. A few weeks afterward the other Lynn newspaper was imposed upon in the same way, the letter in this instance bearing the name of Deacon Daniel Gilmore, and again Miss Eddy demanded a denial of her death. Some detective work disclosed the fact that she wrote both letters herself, and she confesses that her motive was to get notoriety.

The British naval ship Bacchante, a fine iron corvette, cased with wood, has been selected by the Admiralty for the first voyage of the Royal cadets, who are to sail from England, according to present arrangements, in September next. The two princes, sons of the Prince of Wales, Albert Victor and George Frederick, were entered as cadets, in June, 1877; and as the Admiralty regulations stipulate that cadets shall only remain for two years on board the Britannia training ship, it is only following the usual custom to send the princes to sea at the expiration of their term. A second captain is to be appointed to the Bacchante, besides her commanding officer, Capt. Lord Charles Scott, in order to assist in their instruction, while the voyage of the corvette will be of such a nature as to embrace most of the principal seaports of the world. She proceeds in the first place to the West Indies and Canada, and will thence, in all probability, steer south and double Cape Horn. The Bacchante is a large craft of 4,130 tons.

Weakness and sickness changed to health and strength with Hop Bitters, always.

New Publications.

The Voice of Worship,
For Choirs, Conventions and Singing Schools.
BY L. O. EMERSON.

This splendid book is now nearly through the press, and will be in great demand. Full collection of the best Hymn Tunes and Anthems for Choirs, numerous Glees for Social and Class singing, and a good Singing School course. Its attractive contents, with the low price ($1.00 or $9.00 per dozen), should make it the most popular of Church Music Books.

THE TEMPLE. *For Singing Schools. Conventions and Choirs.* By W. O. PERKINS, will be ready in a few days. First class book for Singing Schools, with large collection of Glees, and plenty of Hymn Tunes and Anthems. Price $1.00 or $9.00 per dozen. Although Singing Classes are especially provided for, both the Secular and Sacred Music render it one of the best Convention and Choir Books.

FATINITZA. The new and very favorite opera, is now ready, with words in three languages, all the Music and Libretto complete. Price $2.00 paper. $2.25 boards.

PINAFORE. Price reduced to 50 cts. The same elegant edition heretofore sold for a dollar. Complete Words, Libretto and Music. All ready for the stage.
Any book mailed for retail price.

OLIVER DITSON & CO., Boston.
C. H. Ditson & Co., 843 Broadway, New York. J. E. Ditson & Co., 922 Chestnut St., Phila.

OSGOOD & CO., Binghamton, N. Y.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them.
Manufactured by ZINC COLLAR PAD CO.,
BUCHANAN, MICH.

Wit and Humor.

WATERMELONS.

COME to the mortal as he sits
  Upon a dry-goods box and sips
  The nectar of thy juicy lips—
Come to the youngster as he flirts
  Across the high and peaked fence
  And moves with ecstacy intense
    Thy charms from off the native vine
And thou art terrible.
  O, August-born monstrosity!
  Incarnate colicosity!
Beneath thy emerald bosom glow,
    Like glittering bubbles in the wine,
The lurid fires of deadly woe,
And from thy fascinations grow
The pain, the cramps, the pang, the throe—
And all we fear or dream or know
  Of agony is thine!

[*St. Louis Times-Journal.*

A JOKE RETURNED.

The Palmyra *Enterprise*, published in Jefferson County, Wisconsin, relates this dog story—a pretty good one. A gentleman connected with the United States Lake Survey, in this city, was engaged one day on the skirt of a wood in Indiana. Near him, sleeping lazily in the sun, lay his faithful dog, Tiger. Thinking to have some fun with the dog, he gave a shout and a jump into the thicket as if all the game ever protected by game laws from marauding hunters was thrashing through the bushes. As he expected, Tiger came bounding and barking to the fray, and soon detecting the trick that was played upon him, sneaked back to his lair and lay down again. The surveyor resumed his duties, and was hard at work for two or three hours, when, all at once, the dog rose from his sleep, set his ears and eyes in direction of the wood, gave a bark and made a rush to the forest depths. The surveyor followed the noble brute to a tree up which he was sending canine congratulations to the prey; but when the surveyor came and began anxiously to scan the boughs for the hiding game, Tiger gave a satisfied "Ah Wooh!" bestowed a glance of contempt at the surveyor, and striking a dignified gait, walked back to his couch with the appearance of a dog that had squared up all accounts with the Lake Survey, and had left nothing due on either side.

A LITTLE fellow rushed into the street recently to look at a monkey that accompanied an organ-grinder who was playing in front of an adjoining block. Never having perused the "Origin of Man," he gazed in wonder and admiration for a few moments, and then rushing into the house he met his grandmother, to whom he addressed this inquiry: "Grandmother, who made monkeys?" "God, my boy," replied the old lady in her candid way. "Well," said the excitable grandson in rejoinder, "I'll bet God laughed when he got the first monkey done!"

PERTINENT QUERIES.—What does billet doux? What check did counter sign? Who ever saw a hood wink? Who ever saw a pig iron? What does egg plant? Why did the thunder bolt? Who ever heard a foot ball? Why did the dew drop? Where does clock work? What did plow share? Who ever saw a wheel wright? For whom did penny weight? Who did tin foil? What did brandy smash? What did grass plot? What was it grape shot? What did the pick pocket? Who did the goose berry? Is it jokes that Jim cracks?

NEXT year should be a very prosperous one for clergymen. Besides being leap year, seven eclipses are announced. Eclipses of the moon are welcomed by lovers, but nothing encourages courtship more than a comet with a tail 9,000,000,000,000,500.670 miles in length sweeping across the heavens during the summer nights. Notwithstanding its enormous size, a young lady cannot catch a glimpse of the celestial wonder without leaning her head on her young man's shoulder and have him point it out to her.—*Norristown Herald.*

PREAULT dined one day with a miserly painter, who gave him to eat a soft-boiled egg and a little vinaigrette, washed down with some Suresnes of a bad year. "We will repeat this little debauch," said his host, folding up his napkin, "whenever you like." "All right," said Preault, glaring at his entertainer with hungry eyes, "suppose we repeat it right now."—*French Wit.*

LITTLE Laura was tired and sleepy on New Year's night when she prepared for bed, and forgot to say her "Now I lay me," and in apology to her mother for the neglect, said, as she tugged away at her little stockings, "I couldn't go to heaven to-night, mamma, anyway in the world, tos I'm too tired!"

"You made a fool of me," said an irritated man to his wife, "and that's the way you got me to marry you." "My love," sweetly responded the wife," "You do yourself an injustice. Call yourself a fool if you please, but remember that you are in all respects a self-made man."

THE REASON WHY.

Father to Professor—"How is it that my son is always behind in his classes?"
Professor—"Perhaps it lies in the family."

A GREENBACKER, while denouncing Secretary Sherman as a Shylock, was asked by a listener, "Who was Shylock, anyhow?" The indignant orator replied in withering tones: "Well, if you don't know, you had better go home and read your Bible!"—*Portland (Me.) Press.*

A FELLOW in a cattle show, where he made himself conspicuous by his blnster, cried out: "Call these prize cattle! Why, they ain't nothing to what our folks raised! My father raised the biggest calf of any man round our parts." "No doubt of it," said a bystander, "and the noisiest."

"JOHN, did you take the note to Mr. Jones?" "Yes: but I don't think he can read it." "Why so, John?" "Because he is blind, sir. While I was in the room he axed me twice where my hat was, and it was on my head all the time."

"YOU love me?" echoed the fair young creature, as her pretty head oiled the collar of his summer suit. "Yes," he said, tenderly, "you are my own and only"—"Hush!" she interrupted, "don't say that—be original. That sounds too much like Barnum's show bills."

A YOUNG Parisian lady after being relieved of a tormenting tooth, laid down 10 francs in payment. Looking at the fee contemptuously, the dentist asked if that was for his servant. "No, sir," responded madame, with a smile, "it is for both of you."

"I SUPPOSE the same man," remarks Josh Billings, "would live to be eighty years old on brown bread, roots, and green erbs who would reach seventy-eight years on plum puddin and milk punch. Which of the two ways do you consider the whichest?"

HE was a disgusted boy. He had exercised great caution and had finally succeeded in crawling, unobserved, under the canvass into the tent. And he found it was not a circus, but a revival meeting in progress.—*Boston Post.*

"WHY," asked a governess of her little charge, "do we pray God to give us our daily bread? Why don't we ask for four days, or five days, or a week?" "Because we want it fresh," replied the ingenious child.

THE following was whispered the other evening at the Theater des Varietes: "Do look at that lady! what a low-necked dress she wears!" "That's a postal card costume." "How so?" "No envelope to it."

PIOUS old lady: "Just think, Rose, only five missionaries to twenty thousand cannibals!" Kind-hearted niece: "Goodness! The poor cannibals will starve to death at that rate."

"YES, I want my daughter to study rhetoric," said a Vermont mother, "for she can't fry pancakes now without smoking the house all up."

PUPIL in history class (reading)—"A large party of English ladies and gentlemen"—(turning over two leaves, continues)—"and entirely naked, engaged in a terrific struggle, such as is seldom seen even in this barbarous country."

THE Bible tells us that our hairs are numbered, and we know that they are also sometimes red.

When the Bowels are Disordered,
No time should be lost in resorting to a suitable remedy. Hostetter's Stomach Bitters is the most reliable and widely esteemed medicine of its class. It removes the causes of constipation, or of undue relaxation of the intestines, which are usually indigestion or a misdirection of the bile. When it acts as a cathartic, it does not gripe and violently evacuate, but produces gradual and natural effects, very unlike those of a drastic purgative; and its power of assisting digestion nullifies those irritating conditions of the mucous membrane of the stomach and intestinal canal which produce first diarrhœa, and eventually dysentery. The medicine is, moreover, an agreeable one, and eminently pure and wholesome. Appetite and tranquil nightly slumber are both promoted by it.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XXXVIII. No. 35.
WHOLE No. 1544.

NEW YORK, AUGUST 30, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.—Entered at the Post-Office at New York City, N. Y., as second-class matter.]

Entomological.

COLLECTING AND PRESERVING INSECTS.—No. III.

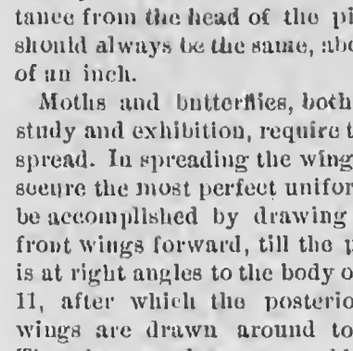
PROFESSOR A. J. COOK.

Apparatus for Preserving our Specimens.

ALL insects, except those preserved in alcohol or other liquids, mostly for purposes of study, are kept in place in the cabinet by use of pins. That our collection may appear better, and that we may be able to exchange with other collectors, it is always desirable and best to secure special insect pins, and pin according to the uniform method generally adopted by entomologists all over the globe. These pins are longer and more slim than common pins, and cost from $1.25 to $1.50 per 1000. All mature insects, except beetles and bugs, should be pinned centrally through the thorax, Fig. 11. Beetles are pinned through the right wing cover, a little back of the pro-thorax, Fig. 9, while most bugs are pinned through the scutellum, Fig. 10, the prominent triangular piece just at the base of the wings. The distance from the head of the pin to the insect should always be the same, about three-eighths of an inch.

BEETLE PINNED.—FIG. 9.

Moths and butterflies, both for purposes of study and exhibition, require to have the wings spread. In spreading the wings it is desirable to secure the most perfect uniformity, which will be accomplished by drawing the primary or front wings forward, till the posterior margin is at right angles to the body of the insect, Fig. 11, after which the posterior or secondary wings are drawn around to the primaries. The wings are drawn around by the use of pins, which should be passed through the wings just back of the large main veins. With small, delicate moths the greatest care is required that we may not tear the delicate organs or rub off any of the minute scales on the body or wings. Only perfect specimens are desired by the best entomologist. To spread insects a spreading-board is necessary. This, consists of two soft-wood boards, Fig. 11 d, d, each two feet long, two inches wide and one-half inch thick, which are held in the same plane, and parallel to each other by cross-pieces, and when nailed are from one-eighth to three-quarters of an inch apart, according to the size of the moth, as this space, Fig. 11, e, e, is to permit the body of the insect to pass through so that the wings shall come down to the plane of the upper surface of the boards. Beneath the open space, cork or corn-stalk pith, is fastened, that it may receive the pin and help to hold the insect more securely. The spreading board illustrated is one of seven drawers, belonging to the writer which rest in a neat walnut case, with wire-gauze door and back. This arrangement prevents injury from mice, &c., and from its ample ventilation, secures the rapid drying of the specimens. The drawers, Fig. 11 are 10 by 12 inches. Below these drawers in the case is a common drawer for holding pins, forceps, &c. To hold the wings when spread, small rectangles of glass, Fig. 11, a, with edges ground off, are laid upon them. Some entomologists prefer thick cardboard cut into small pieces. These pieces, Fig. 11, b, by pinning above the wings, will press the latter and hold them in place till they dry.



BUG PINNED.—FIG. 10.

After pinning, insects may be kept in pasteboard boxes, boxes made of soft wood, with close-fitting covers, or in drawers which may slide into a cabinet. In all cases the closer-fitting the boxes are, the better.

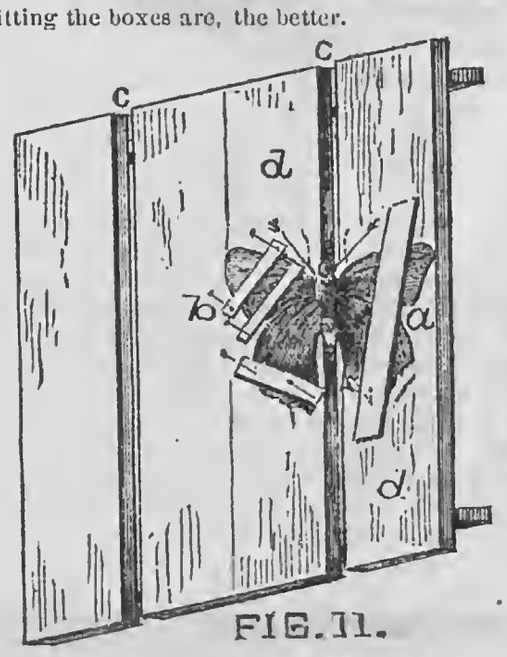


FIG. 11.

SPREADING BOARD.

The bottom of the boxes should be lined with cork or corn pith, to receive and hold the pins. If the latter is used, it should be boiled in water for a time, that the pins may not corrode. The boxes will look better if the cork or pith is covered with clean white paper. Two sheets of heavy white paper, spread upon a frame just large enough to pass closely into the box, one held one-quarter inch, and the other one-half inch from the bottom of the box serve well to hold the insects, especially if the bottom of the box is of very soft wood, which will receive the points of the pins. In pinning insects, heavy forceps, either straight or bent, Fig. 12, are very desirable. Insects in boxes must be kept from the mice and carefully guarded from moths and other insects. These latter are the greatest pests of the cabinet, and can only be kept from doing serious mischief by the most active vigilance, on the part of the entomologist. Rectified benzine will destroy these museum pests, and not harm the specimens. It is better to exercise so much caution that we shall be free from these ruthless destroyers. Very close boxes or cases, which are never to be left unclosed, and placing all new insects in quarantine boxes before putting them into the cabinet, are among the safeguards.

PINNING FORCEPS.—FIG.—12.

Larval insects may be kept in alcohol, or, to better preserve their color, in benzine. If it is desired to pin the larvæ in the cabinet, we may prepare them for it by enlarging the anal opening and carefully pressing out through this the entire viscera. We may distend the body properly by blowing in air through a straw, and while still blowing, bake the body in a small tin oven well heated with a lamp. With the proper care the specimens may often be saved by this method, so as to represent the living appearance almost perfectly.

The live collector will not be satisfied to collect and preserve and go no further, but will desire to watch the marvelous changes presented by insects during their development, and so will desire to rear insects, and for this purpose will need a breeding cage. Here he will collect the various parasitic species. A glass can, covered with wire cloth, will answer for a cheap breeding cage. A box, one foot each way, with one side glass and one side fine wire cloth, will be better. Or he may have a neat walnut case, Fig. 13 with a glass door, and gauze back and ends. The writer's case consists of several such apartments, separated by wire-gauze partitions. Earth in the bottom of a breeding apartment will serve to hold the food plants, and will offer the insects an opportunity, if they pupate beneath the ground. Larvæ that feed on leaves ought to be fed often with fresh food, which is all the more acceptable to the insects if dipped in water before being placed in the cage. A small bottle sunk into the earth at the bottom of the cage will hold the plants upright, and if kept filled with fresh water will keep the plants more fresh.

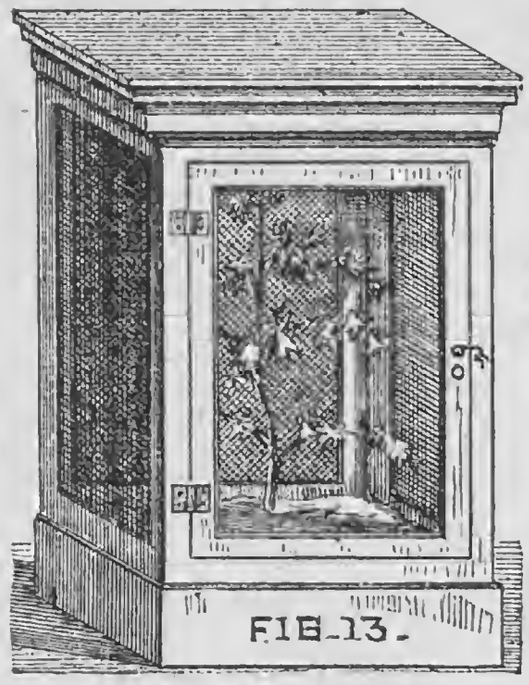

FIG. 13.

INSECT BREEDING CASE.

Insects may be sent by mail at a very light expense. They may be pinned to a cork at the bottom of a light wooden box—paste board boxes are apt to be crushed in the mails—or wrapped carefully in cotton batting. Larval insects should be inclosed, together with some fresh food, in a perfectly tight box. They need no air, and in close boxes the food will keep more fresh.

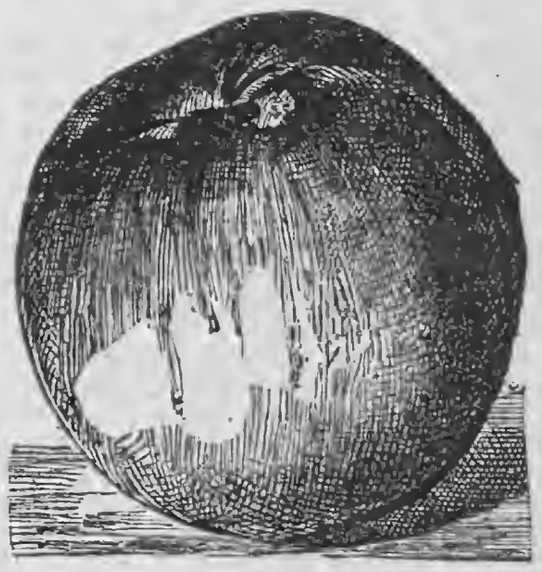
I close this paper with the hope that some may be led, by its production, to study those pages of nature, which ever serve to interest and give valuable instruction to him who is so happy as to be led to their perusal. The writer is indebted to Mr. S. Upton, of the sophomore class in the Michigan Agricultural College, for the above drawings.

TO DESTROY THE PEAR SLUG, which fortunately feeds on the upper side of the leaf, air-slaked lime, or lime carefully slaked with just enough water to cause it to fall into a dry powder, is recommended as the most effective application. Next to this come wood ashes. If these are placed in a bag of mosquito netting, or some other open fabric tied to a pole, they can be readily dusted over the leaves. If only a little comes in contact with the slug, its hours are numbered. Hellebore used as upon Cherries, is also sure death to the pest, and even an application of road dust will kill it in most cases.

Pomological.

THE WATERLOO PEACH.

MESSRS. ELLWANGER AND BARRY, of Rochester, N. Y., write to us with regard to a specimen of the Waterloo peach sent us by them, and of which the accompanying cut is a fair representation. "The fruit is not so large as it was last season, owing to the overloaded condition of the tree on which it was borne. It also ripened a week later than last year. We find this to be the case with all the very early peaches we have seen thus far. The tree from which the specimen was picked was cut back severely last August in order to force every bud possible. This, we think, is one reason why the fruit is smaller and later than



usual. Mr. Davidson's seedling, raised at Paluesville, Ohio, and sent us for examination, was ripe last summer on July 9, and measured seven inches in circumference. Those sent this season arrived on the 29th of July and were not then fully ripe. They averaged 6½ inches in circumference, exhibiting a marked difference in size and time of ripening. The Cumberland and Musser peaches, received on July 26th, from H. M. Engle & Son, Marietta, Pa., measured 6½ inches in circumference, and Downing, Saunder's and Wilder grown here, measured the same. Among all these, Waterloo averages the largest."

THE ALEXANDER AND AMSDEN PEACHES.

I HAVE before me, as I write, two baskets of beautiful Alexander and Amsden peaches, which have just been gathered from young trees in our experimental orchard. As I look upon this handsome, luscious, early fruit, I wish your readers could enjoy the sight. As they cannot, probably it will be interesting to them to learn how remarkably fine these peaches have been with us this season. We have several trees of each variety in bearing, and they are weighed down with fruit, presenting an unusually attractive appearance. The first really ripe peaches were gathered on August 6th. To-day, the 8th, there is an abundance of ripe fruit. In appearance these varieties resemble each other so closely that it is almost impossible to distinguish them. Alexander, however, averages larger and will, most likely, prove to be the favorite on that account, although Amsden is a little better in quality. Compared with Early Beatrice growing in the same orchard, Alexander is about three days earlier, and about six days earlier than Early Louise and nearly ten days in advance of Hale's Early. Beatrice is so small and of such inferior quality that it must soon be discarded, and so with Early Louise, Downing and Wilder. These ripened here about the same time as the Alexander, but are not so large. Cumberland and Musser may ripen a little earlier than Alexander, but they also

are smaller. Honeywell ripened with the Alexander, but was entirely devoid of flavor. I think, therefore, judging from the season's experience, that next to the Waterloo, the Alexander may be regarded as the most valuable of the very early Peaches. What disposition to make of the Amsden it is difficult to determine. Should it prove in other localities equally good in quality, it ought still to be propagated for amateurs' use. We think, after another season's trial, the list of early Peaches can be still more reduced. W. C. BARRY.

Mt. Hope Nurseries, Rochester, N. Y.

SHALL WE PLANT ORANGES?

MRS. L. S. HOUHTON.

CONCERNING the length of time required by an orange grove to become a source of income, I may remark, with Sir Roger de Coverly, that "much may be said on both sides." That much has been said on both sides, cannot at least be questioned. It was but yesterday that I read, in the columns of a paper published in the "Orange Belt" of Florida, a calculation proving by figures, which are supposed to be incapable of falsehood, that the orange grower would, in five years, from a grove of five acres, receive not only all the money he had invested, with interest at eight per cent., but would realize a clear profit above this, of some fifteen hundred dollars. These figures were based upon the assumption that every tree in the grove would live, and that each would bear a thousand oranges the fifth year after being set out. The young man in general was then asked where in the North he could hope to achieve a like success.

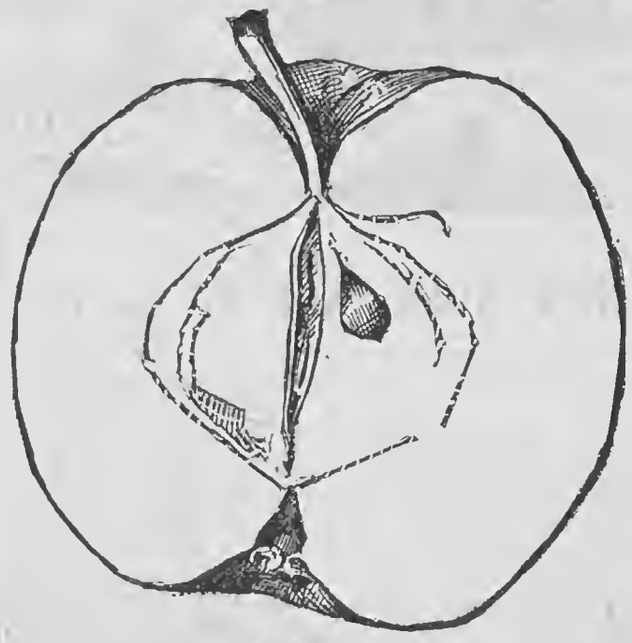
Such a conundrum would, perhaps, be best answered, Yankee-wise, by asking where in all the South the writer could find trees which had averaged a thousand oranges the fifth year after having been set in the grove. These extravagant assertions, however, are met, on the other hand, by those unbelievers who assert that twenty years are not too long to wait before an orange grove may be expected to become profitable, and they challenge their adversaries to produce the man who has made money from a young grove, in less time than that. Here, again, is an enigma scarcely less difficult to unriddle than the former one, since all the young groves in Florida having been planted within ten years, and the greater number of them within five, it would be no easy task to disprove the assertions of those gloomy ones. But as a matter of fact, few of the more sober-minded claim that a grove will become a very profitable investment in less then ten years.

If the proof of the pudding is in the eating—a proposition which few will be prepared to deny—why not the proof of the orange grove? And that there are orange groves which offer abundant proof that they may be made profitable to one's friends, at least, in less time than twenty years, or than ten, I am happily in a condition to testify. The most hardened sceptic would have yielded to the proof placed before him, had he been my compaunion in visiting a certain grove, a few days ago. And I am confident its owner will pardon my violation of the sanctities of hospitality in making public some of the facts I learned from my visit, since he is quite as anxious to disseminate the sober facts of orange-culture, as I am. It is, indeed, to his pen that we owe our most valuable and practical treatise on the culture of the orange.

The grove of the Rev. T. W. Moore is at Fruit Cove, on the St. John's, not many miles above Jacksonville. It presents a very attractive appearance, as seen from the river, shaded and sheltered as it is, by broad overhanging Live-Oaks, beneath which the glossy foliage and golden fruit of the young orange trees are seen to the best advantage. There are, I believe, some five thousand trees in the grove thus seen from the river; the trees being of all ages, from four to nine years old; a large number of them are bearing, some of the trees being very heavily loaded.

I do not propose to give any numerical proofs of the value of this grove, for I know nothing of them. I cannot say how many of the trees are bearing, nor what is their average yield, nor what they have brought or are likely to bring, in the market. I know—for Mr. Moore told me—that ten years ago the forest on this land was so dense that one could not see a man at ten feet distance; whereas now he may at least rejoice in the sure prospect of a good and ever-increasing income, from this year onward. The number of fine varieties of fruit in this grove is something to be remarked. It seemed as if each orange that we tasted was sweeter, or more aromatic, or more delicate in texture, or larger in size, than the others. Mr. Moore has spared no pains to get buds from choice fruit, often going miles out of his way to procure them from some tree which was well reported of. That he should find, in nine cases out of ten, that the fruit was nothing remarkable, did not surprise or discourage him; he was well satisfied that the tenth effort gave him something which he could value. Thus he has now, not merely a fine variety as to texture and flavor, but as to time of ripening, having trees in bearing, which ripen their fruit all the way from October to March.

About one half of Mr. Moore's trees, if I remember rightly, are budded, the remainder being sweet seedlings. A number were budded upon sour stumps, and thus produced fruit some years earlier than did the young trees, but these latter are already outstripping the older trees in growth, and will soon become much more valuable than they. Mr. Moore's method of pruning is such as to form



THE SUMMER ROSE APPLE.

a low, spreading tree, from which much of the fruit may be gathered without the use of a ladder. The tree is very open within, permitting free circulation of air, but the exterior surface is a dense mass of foliage and fruit.

I was much interested in an account Mr. Moore gave of his method of planting one portion of his grove;—the more so, because I have recently learned by experience the cost of clearing up hummock land. I had observed that the trees in one portion of the grove were not set in regular lines, and on inquiring the reason, he explained it to me somewhat in the following words.

"The trees were planted in the hummock with no previous preparation except underbrushing. The brush was cut and piled in heaps to decay. Wherever there was room to dig the hole, we set the tree. Afterward we went through the grove, and girdled all the Hickories, Water Oaks and other trees which we wanted to get rid of. They dropped their branches, which were also piled up, and rotted away. At our leisure we then cut the dead trees, falling them in such directions as not to injure the young trees. The trunks were also cut and piled, to decay upon the ground, thus affording a valuable fertilizer."

"But what did you do about the stumps? I do not see a vestige of one here."

"We kept them shrubbed down, and they rotted away. We have never grubbed up any."

"And did weeds and grass never trouble the trees, thus left without cultivation?"

"The ground was too much shaded by the remaining forest trees, for grass to grow."

"And this has all been done"—

"Within nine years."

And now the young trees are bearing, under the shadow of the beautiful Live Oaks which sway their moss-draped limbs above them, protecting them alike from frost and sun. Surely in all Florida, there cannot be found a more picturesquely beautiful grove, or one which has been made with less outlay of money and of labor. There are twenty-four hundred trees in this part of the grove.

The grove which we visited is, I understand, one of three planted and owned by Mr. Moore. This work has been, one might say, the recreation of a busy life, for Mr. Moore is not as much, nor even as successful an orange grower, as a pastor and preacher. As Presiding Elder in the Methodist church he has traveled thousands of miles, and preached thousands of sermons, while the trees planted by his hands, or under his direction, have been slowly growing to matured beauty and usefulness. One such example as his will go farther to put the orange question before the public in its true light, than choruses of croakings, or reams of such enthusiastic calculations as are so freely circulated among us.

Magnolia, Fla.

INFLUENCE OF STOCK ON GRAFT.

THE article of Mr. S. B. Peck upon this subject, in the RURAL of August 16th (p. 517), exactly accords with my experience. My attention was first called to the matter some forty years ago, when my grandfather, to please me, grafted cions of a favorite summer Apple (Sops of Wine), which I brought him from my father's orchard, into a branch or two of each of several trees. All these grew and bore fruit, but only one of them grafted into a Pound Sweet, ever produced nice apples resembling the original in quality. The rest grafted into Russet trees, gave a fruit somewhat resembling the Sops of Wine, externally, though smaller, but internally they were green-fleshed, hard, and, in short, worthless.

We have had, in this cold section, a very extensive experience in grafting the Apple on the Siberian Crab, in hopes of making tender sorts successful. It is an utter failure, not only in that respect, but when tried with hardy sorts; in the latter case giving us poor fruit and unhealthy, short-lived trees.

Experience has slowly led me to the belief that the less of the stock there is to a grafted tree, the better. Consequently I would always practice root-grafting, and set the grafts deep enough to encourage the development of roots from the cion. Not all kinds will strike root freely under such circumstances, but those which do, make the best trees and bear fruit truest to their original. Examination has shown me, in many instances, that when two-inch roots are used, with six or seven-inch cions, set so that only one or two buds are above ground, the "nurse-root" hardly survives the first season; or, if it does, it furnishes but a very small fraction of the root-system of the tree. I was very much prejudiced against this method of propagation, and have in fact denounced it savagely in years past, but I must now confess that trees grown in that way, to prove its badness, are among the best in my orchard. T. H. HOSKINS, M. D.

Orleans Co., Vt.

THE SUMMER ROSE APPLE.

W. S. T., Upper Red Hook, N. Y., sent us for name, the other day, a couple of specimens of an apple which he describes as of excellent quality, flat rather than long. Mr. Charles Downing, to whom we forwarded a specimen, writes us with regard to it: "It is the Summer Rose described in Downing, page 371, where Woolman's Harvest and Lippincott's Early are given as synonyms. In addition to these it is also known as Early Woolman, Early Rose, and Lodge's Early. I have also ascertained that it originated on the farm of Aaron Lippincott, Salem, N. J. It is an old variety but of excellent quality for home use, handsome, with very tender flesh, juicy and one of the best among the summer apples." The accompanying cut presents a fair illustration of one of the specimens sent us.

Horticultural.

LESS POPULAR STRAWBERRIES, ETC.

THE Sharpless Strawberry is, doubtless, receiving a greater amount of admiration and praise than any variety yet introduced, and well it may, for it certainly is of prime quality and monstrous in size. But, for all this, I think there are many other varieties that possess qualities equally as good as the Sharpless, and which, nevertheless, have not received half the amount of praise that has been bestowed on this new variety. Of the less popular sorts, I shall mention only two or three.

THE DUNCAN has as yet attracted but little attention, and why it has not received more admiration I can't understand. The plant is a strong grower, and its foliage of a beautiful, glossy, dark-green color. The fruit is very early, large, of good shape, bright crimson in color, and of most delicious flavor, while on rich soil the vine is very productive. What more can you expect in one variety? "Is the fruit firm?" some one asks. Yes, quite firm enough for near markets, and in some localities it endures long carriage well. It should have a place in every collection. It is one of my favorites, and I shall set more of this than of any one variety.

THE BLACK DEFIANCE is another sort that has received comparatively little praise in the horticultural journals. But it has been rather despised by some fruit growers, and they threw it aside as "a shy bearer." Had they given it a more thorough trial, they would probably have formed a different opinion. Its want of popularity is doubtless due to the fact that it will not succeed on every sort of soil. Neither will the Jucunda or Seth Boyden, and yet these two are far more popular than the Black Defiance. On deep, rich, rather heavy soil, it is second to none for market or family use. It is very productive, in size as large as the Boyden and equal in quality to the Jucunda. It is oblate in shape and grows very regular; its color is deep red.

OF THE OLD KENTUCKY very little is said in the papers now, and I find many fruit growers have discarded it altogether, because it is a pistillate sort. This ought not so to be, for if it is set between staminate varieties it will yield handsomely, and *such* berries, real beauties of fine quality and sufficiently firm for near markets. I should not know what to do without it. It should be specially prized for its extreme lateness.

THE TURNER RASPBERRY and Kittatinny Blackberry—I have not yet fruited the Cuthbert Raspberry, but of all other red varieties, I have not found one that, all in all, has pleased me as well as the Turner. I often wonder why it is not more generally grown. True, it suckers very freely; but the young shoots are very easily subdued with the hoe, while its good qualities, I think, overbalance this general objection to it. With me it is very productive; the berries are of good size, moderately firm, and of superior quality. More than this, it is probably the hardiest Raspberry in cultivation, a fact that makes it especially valuable for cold climates.

THE BLACKBERRY is without doubt grown less than any of the small fruits—unless it be the Gooseberry—and why is it? Ripening as it does about the same time as peaches, it hardly gets a show in the markets and much less in the garden. Peaches are good, *very good*, and so are nice, ripe Kittatinny blackberries. I prefer the Kittatinny to Lawton on account of its superior quality. It is now in its beauty, the bushes being literally loaded down with their rich glossy fruit. Why will so many do without this delicious berry when it can be grown so easily? W. M. NASH.

Fairfield Co., Conn.

TOMATOES ON TRELLISES.

As an experiment I trained one tomato vine this year on a trellis and do not think I shall ever plant another vine, without some kind of a trellis, unless it is to experiment. The fruits on trellised vines attain a large size, are juicy and do not taste of the ground. While the fruit of the vines that were left to run on the ground, were rotting, those trained to a trellis were sound and growing rapidly. The trellis I use is the same as the one described and engraved in the RURAL last spring. It takes but little work to make one. Any farmer can make all he wants in the barn some day when it rains. The fruit will ripen more evenly and ten days earlier—which is quite an advantage. Moreover the arrangement gives the garden a more tasty appearance and it is much easier to keep the trellised ground free from weeds. C. T.

Millersville, O.

Field Crops.

HISTORY OF A POOR FARM.—No. 15.

About Corn Growing.

THE dry, hot season has furnished a good opportunity for observing the effects of cultivation during an unusual drought. From the middle of June up to the middle of August the soil has been parched almost continuously. Showers have fallen occasionally, but they have been heavy, beating, thunder showers and drying winds have followed them; so that but little good effect resulted from them. A 12-acre field planted in sweet corn and beets, has furnished an opportunity for testing some theories and practices. Part of the corn has been cultivated with the common reversible-tooth cultivator, part with the Planet Jr. horse hoe, and part has been plowed. Some of the beets have been cultivated after every shower and before the ground had dried, and the remainder have been worked in the usual manner and without reference to the moisture of the soil, but merely to keep down the weeds and mellow the surface. The effects have been as most farmers would have expected.

"I don't know about that" remarked Mr. Martin," most farmers work their corn with the plow and prefer earthing or ridging it up, to the level cultivation of the horse hoe or cultivator. Besides, Dr. Sturtevant approves of the root-pruning of corn by deep plowing, and Fred root-pruned part of that corn pretty well; yet the plowed rows are the poorest in the field."

"And they might well be" rejoined Dr. Jones. "If it was intended to dry out the soil, no better plan could have been adopted. If the season had been wet and the soil clayey, instead of sandy, the ridging would have been admirable; it would have drained the roots

and lowered the water level below them, and have given the sun a chance to warm the soil. You see "circumstances alter cases" as I think some one has pointed out before, and what would have been an excellent method in a wet season upon heavy land, has simply destroyed the crop in this light, warm, dry, sandy soil. It was wise in Fred to plow but a dozen rows, for the labor of planting has been all lost."

"Not quite lost;" I replied, "for it has given you a chance to make a useful application of the result of an experiment, by which is shown that plowing and root-pruning corn may fail on light soil in a dry season."

"Well, you can look at it in that light," replied Dr. Jones; "but I would like to add that there is a good deal of harm done by generalizing, and by blindly following the example of this or that man, or taking this or that man's advice without considering the difference existing in the circumstances. I have six acres of corn in the flat, and to-day, after the rains of the past three days, the ground is all under water, excepting the tops of the ridges where the corn stands. My corn has dry feet, if the water stays for a week; but yours, where it is cultivated flat, is only nicely moist, and may be worked to-day, if you wished. Now my corn is better than the best of yours, and yet it was plowed more deeply than yours; some of the ridges are 18 inches from top to bottom."

"You are not out of the woods yet and can't afford to halloo; wait until you come to husk your crop, and I think you will find the deep plowing has shortened the ears," said the old gentleman. "The roots must have some ground to run and spread in, and in those drills they have not two feet. That is too close pruning, I think. I like to see corn plowed, and always plowed my corn, but I never plowed out the middles deeper than the roots would run across the rows. I have often seen the ground washed out of the middles by heavy rains and the roots have run across both ways from hill to hill, and the ground was full of them. Then you have good corn and long ears, well filled."

"Well done, old friend," replied Mr. Martin, "that is quite a long speech for you, but it is full of sense. Do you know what made those roots run from row to row? They were after the manure which you plowed in and mixed up with the soil, while Dr. Jones has the manure dropped in the rows and the roots have no inducement to travel here and there for nothing. They are just staying where they can find something to feed on. Is not that right, Doctor?"

"You may be right," replied Dr. Jones; "I never knew of a root of a plant leaving rich feeding ground to wander in poor soil; roots have a sort of instinct for finding food."

"If that is the case," I rejoined, "those rows that were ridged in my field have been starved, because the manure was plowed in, and the deep plowing has cut them off as well as dried up the soil. It is clear that working corn with a plow in light land and in a dry season will not answer. Now let us look at the cultivated rows. These that are weedy in the rows were worked with the common cultivator and the ground was kept flat. A good deal of hand-hoeing has been done here. The next rows were worked with a horse-hoe that has a small plow on each side, by which the soil is thrown on to each row. These are clean and free from weeds, and no hand-hoeing has been done. Yet the corn is far better than on the other cultivated rows."

"If you had planted the corn in squares and cultivated them both ways, it would have been cleaner," said the old gentleman.

"No doubt," I replied; "but this corn was planted with a corn-planter, and four acres were put in the ground and finished and some fertilizer was dropped in the hill at the same time, all in half a day. If the ground had been furrowed out both ways and the seed dropped and covered by hand, it would have taken four days. The seed is dropped in the rows 18 inches apart, and there will be twice as much fodder and considerably more ears than if it was planted in squares three feet apart. The weeds, you see, are chiefly the fault of the poor tool, which only stirs the ground and does not throw any in the row, as you can see by the other rows that were horse-hoed. We have some corn planted in squares, and by-and-by Fred will be able to tell you the difference in the yield."

"Planting in rows is the best; there is no doubt of it," said Dr. Jones. "No ground has yet produced a crop equal to its natural capacity. Dr. Voelcker has carefully analyzed the soil of a field to the depth of 18 inches, and has found an enormous quantity of nitrogen and phosphoric acid in it. The total amount is hardly to be credited, but it is doubtless true. There were 11,625 pounds of phosphoric acid and 10,300 pounds of nitrogen per acre found in the soil. The 18 inches of soil over the whole acre weighed about 7,500,000 pounds, so that there was only 1½ pound of each of these substances in the 1,000 pounds of soil, or .015 per cent., and there are many soils that have more phosphoric acid in them than this; so that the largest crop we could ever raise would be far from exhausting the soil of even its available measure of fertility, although no manure or fertilizer were applied to it. Therefore, the closer the planting, up to a certain point, the more we can or ought to produce. This is proved to some extent by the constant increase in a corn crop planted in drills over one planted in hills, the drill-planting being, of course, closer in the row and the crop being equally well worked in either case."

"I think the Doctor makes too much of that experiment of Dr. Voelcker's," remarked Mr. Martin. "A hungry man may have a car-load of pigs and a ship-load of flour, but yet he could not make a single meal of bread and bacon of the whole; all that food is unavailable to him, because it is not in such a condition that he can use it to appease his hunger. It was precisely the same with that soil. If I remember rightly there were only 40 bushels per acre of wheat taken, the next season, from that field examined by Dr. Voelcker and yet there was nitrogen and phosphoric acid enough to produce several thousand bushels of wheat per acre. Why did not that land produce 60 or 80 or 100 bushels of wheat? Simply because the plant-food in the soil was not in a condition for the wheat to make use of it. The explanation of the increase of corn in drills must be given in some other way. It is a fact I can grow more corn by drill planting than by hill planting and twice the fodder; but the reason to my mind is that in hill planting the roots do not occupy all the ground, while they do in drill planting."

"That is a good reason, too," said Dr. Jones, "and you may be right, but I want to hear how the cultivation of those beets resulted. There is something that is not yet precisely understood in regard to the effect of loosening the surface soil in dry weather."

"It is a short story," I replied. "The rows which were cultivated immediately after the showers and while they were moist, did not dry out, as did those that were worked only in the usual manner and without reference to the moisture in the soil. The beets speak for themselves. Those in the first rows are twice as large as the others, and all through the season the first rows were never so dry as the others, and these never gave any indication that the loose soil gathered any moisture from the atmosphere in any way, so as to affect the growth of the crop. The effect seemed to be that the loose ground held its moisture with great tenacity, the loose soil acting as a mulch; but, once the soil was dried, all the cultivation did not bring any moisture back again. The same was noticeable in the corn rows. This evidently shows that if we wish to gather the benefits from loosening the surface soil, it should be cultivated and made mellow while it is moist, and the moisture preserved in that way from evaporation; and that if we permit the soil to dry, we cannot bring back the escaped moisture by all the cultivation we can give it."

GREEN VALLEY GRASS—GUINEA GRASS—JOHNSON GRASS.

EDS. RURAL NEW-YORKER:—In the RURAL of August 16, you name a specimen of grass sent you from Texas, "Guinea Grass—*Sorghum halepense.*" There are some facts respecting this grass, which may prove of importance to dairy farmers and stock-raisers, especially in Southern and Southwestern States. Many readers of the RURAL are no doubt aware that, during last fall and spring, there was advertised, in several papers of Northwestern Missouri and adjacent parts of Iowa, a new forage plant by the name of "Green Valley Grass," of which seeds and roots were offered for sale. It was said to have been introduced from Texas, and formerly from the West Indies, and described as a perennial of remarkably vigorous growth, attaining a hight of six to eight feet, if not cut, and yielding six to eight tons of good hay per acre, if cut four or five times during the season, besides a large amount of winter pasture, and, last of all, a great crop of roots (rhizomes), which are valuable food for hogs.

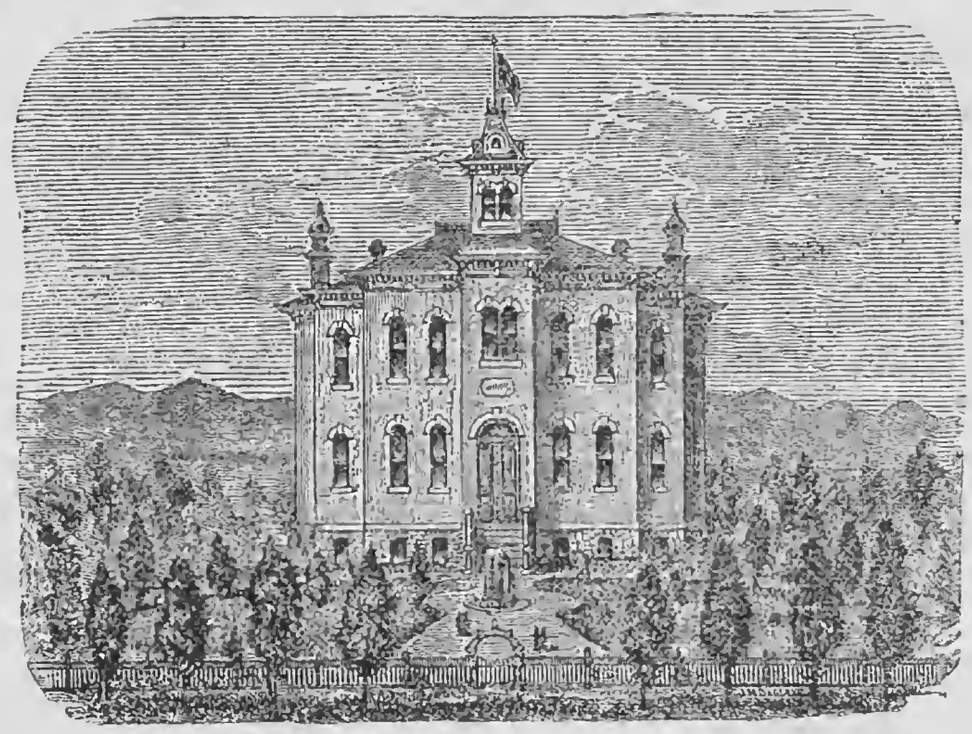
Being curious to learn more about this wonderful grass, I wrote to the principal advertiser, inquiring if he could inform me of its botanical name, or when it was brought from the West Indies, etc.; also asking for a few of the roots for experiment. He could not give me the desired information, but sent some roots, and also such testimony as satisfied me that he was not designedly perpetrating any fraud or humbug, but that he really believed the article to be new and valuable, as was stated. I planted the roots in May, during a severe drought, which has continued with very little relief to this time. The soil was sandy and poor, and no culture or care was given, but the plants grew vigorously and in two months attained the hight of six feet and formed heads and blossoms, the whole plant resembling a slender growth of Indian corn, with finer leaves and tassels, but branches and leaves instead of silk or ears. I sent one of the heads to Prof. Asa Gray, asking its botanical name, which he gave as you have done—*Sorghum halepense*—and this, I remembered, was the name of a Southern grass, of which mention was made several years ago, with some high commendations, in the Reports of the Department of Agriculture. In the reports for 1873 and 1874 I find a number of extracts from correspondents in Texas and other Southern States, describing this grass correctly, but giving it several local names, as Johnson Grass, Guinea Grass and St. Mary's Grass, and nearly all speaking in lavish terms of its excellence for hay and pasture and its wonderfully luxuriant growth and ability to withstand heat and drought. Readers who are interested can turn to the report and peruse these articles for themselves.

Indeed, there is so much useful information often contained in these reports that it would well pay our farmers to secure copies of them through the members of Congress for their districts, and read them in the long winter evenings. Pity it is that they so seldom fall into the hands of those who would utilize them to the best advantage; but that instead they are too often consigned to the waste-paper man, unread or merely glanced over.

It appears that the grass was introduced into the Island of Jamaica from Africa, many years ago, and from thence to Texas, Florida, Louisiana and Alabama, where it has been known to some extent for the past twenty-five years, or longer. It is stated that in 1873 the Commissioner of Agriculture, hearing such good reports of Guinea Grass, from Jamaica, imported seeds by that name and distributed them in this country, but supposed the plant to be a species of Millet which was also called Guinea Grass, and hence it is uncertain, to me at least, whether the seeds distributed thus were the genuine *S. halepense* or something else; and I have never seen a word published as to any result from that seed distribution. Can any reader of the RURAL enlighten us about it? And can anybody inform us why this grass, so highly praised and seemingly of real value, has not become more generally known at the South? I would also inquire whether anybody has tested the ability of the roots to endure freezing or withstand a Northern climate. If they will do this, of which I have doubts from its tropical origin, I shall expect to find it become a valuable acquisition for our dairy and stock farmers, especially in seasons of drought like the present.

Painesville, O. M. B. BATEHAM.

[A number of our readers can inform Mr. B. that the roots are quite tender. We have it growing both at the "Rural Farm" and "Rural Grounds," and shall report in due time.—EDS.]



COLORADO AGRICULTURAL COLLEGE.

Industrial Topics.

COLORADO AGRICULTURAL COLLEGE.

THIS College is located on the southern bank of the Cache la Poudre, about six miles east of the foot-hills of the snowy range and thirty-five miles south of the State line; it is surrounded by a fertile and well-watered region, including some of the best agricultural lands in the State.

Its elevation of 5,100 feet above the sea level gives it a pure, dry atmosphere, while its proximity to the mountains brings it within the limit of occasional rains, thus rendering the climate pleasant and salubrious and adapting the soil to the cultivation of the cereals. This region, comprising the counties of Larimer, Weld, Boulder, and parts of Arapahoe and Jefferson, is rendered accessible from the north and south by the Colorado Central Railroad, which passes directly through Fort Collins, and by the Denver Pacific Railway, both of which roads connect with the Union Pacific at Cheyenne and with the Kansas Pacific at Denver. The streams draining this region, the Cache la Poudre, Big Thompson, and other tributaries of the South Platte, furnish an inexhaustible supply of water for purposes of irrigation. It is estimated that the great irrigating canal now in process of construction and supplied from the Cache la Poudre, will bring at least 100,000 acres of unproductive land under cultivation. The College has been most judiciously located with reference to this large extent of farming land, in the midst of communities refined and progressive and very fast surrounding themselves with all the comforts of the most advanced localities in the West.

W. F. Watrous is President of the College; H. Stratton, Secretary; John J. Ryan, Treasurer; E. E. Edwards, Ph. D., is President of the Faculty; A. E. Blount, A. M., Professor of Practical Agriculture and Farm Superintendent; F. J. Annis, A. B., Professor of Chemistry and Mathematics.

The object of the school is to impart a thorough and practical knowledge of all those branches and sciences that pertain to agriculture and the mechanic arts. Tuition is free to all within the State. A matriculation fee of $5.00 is required of each student on entering and an incidental fee of $1.00 each term. Board and lodging can be obtained for from $4.00@$6.00 per week.

Thus it will appear that our farmers may send their sons to this institution for $250 per year. Removed from the temptations of cities, favored with a delightful climate, instructed in all branches of learning essential to prepare the student for agriculture or for the usual occupations of life, this College is fitted to accomplish great good, and we heartily wish it may be appreciated to the extent of securing for it a high prosperity and an endless career,

Farm Topics.

THE COMMON SCHOOLS, THE FARMERS' HOPE.

MUCH has been said and written in regard to an improved culture of the rural classes. They are demanding something more than hitherto, and asserting for themselves a higher position in the social scale. While there are steps backward as well as forward in all movements towards a higher civilization, we may be sure that the end here sought will be reached. Agriculture in all its departments must, in years to come, command a higher class of talent and a broader culture than in the past. While we are inclined to give high honors to the rural press, to the associations and societies formed to promote rural interests, and to agricultural colleges, where they at all recognize the object of their creation, the more intelligent among the masses are feeling that they can justly demand something more for the children in the common schools than has hitherto been offered them. We ask that the culture of the common school shall be turned in some slight degree towards rural and industrial interests. A more general diffusion of knowledge relating to agriculture and industrial pursuits is demanded. Our children need culture that shall impel towards farm life. This cannot be attained by the instrumentalities now employed.

Hence we propose that the common school shall be made more tributary to our rural interests. We want an elementary course of instruction in matters, both practical and scientific, that relate directly to rural life. This should be so elementary in its character that the great mass of our children may acquire it by the time they are fourteen years old. By this means the common school will, to a certain extent, become the training school of our agricultural and industrial colleges. These latter institutions will then have opened to them a much wider field of usefulness and the

possibility of a much more thorough culture to those who may enjoy their advantages.

Manhattan, Kan. PROF. ELDRIDGE GALE.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Our Own Bread—More About Clawson Wheat.

We have found a miller who thinks he knows why Clawson wheat makes a poorer quality of flour than most others. "You know," he says, "there is a difference in potatoes; some are fine-grained and some are coarse-grained, and still they are all potatoes and may all look well; but the fine-grained potatoes are much more palatable than any others. It is the same with Clawson wheat; it is plump and nice-looking, but it has a coarse grain, and on this account cannot be ground into as good flour. I have tried it every way, and have done my best, and I cannot make flour of the first quality out of it." We think these conclusions, especially the latter part, must be accepted. The truth is, the patent-process flour has made the standard of flour with most housewives so high that no home-grown wheat and home-ground flour will suit them. It is a misfortune that this is the case, as it interferes materially with the good old-fashioned notion of raising one's own breadstuffs. If the standard could be lowered somewhat, and a taste withal for plainer bread developed, there might be better health in many farmers' families and more encouragement to be perfectly independent. We are not prepared to advocate reducing the standard to so low a grade as rye flour, but we do think we ought to cultivate a taste which would be satisfied with what we can profitably produce on our own farms.

From all the information we can get, Clawson wheat, for general cultivation, which includes all kinds of soil and climate as well as tillage, is the most profitable. We have no doubt but that it will improve in quality with good and continuous cultivation. We recollect, about thirty years ago, when the Hessian fly and weevil destroyed all the wheat, that a foreign variety of inferior quality, not much better than rye, was introduced into the country, and became in the older States the almost sole dependence of farmers. This variety, the Mediterranean, from a necessity at first, improved rapidly to excellence. The desire for change, which is a national weakness, has resulted in the adoption of newer sorts, which, in turn, have been abandoned, and now we all long for the old Mediterranean.

Clawson wheat may be sown early or late, on good land or poor, and a remunerative crop is almost certain. We are not yet prepared to give it up.

Cheap Pig Feed.

On the 10th of August we turned over an acre of barley stubble and sowed it, broadcast, with flat turnips. We expect this will make feeding for two months for the store hogs. We intend to let them help themselves, having constructed a temporary sty in the field for their shelter. This is the easiest and cheapest way we have found to feed our pigs during the latter part of fall. It doesn't make any difference if the turnips do not grow large; in fact, smaller-sized ones are preferable, as they can be more readily eaten. The pigs eat tops and all. A crop of turnips, to be fed in this way to pigs, may be put in as late as the first of September. Six weeks of growth on rich land will afford, tops and all, a large amount of food. The ground is in excellent order, and made richer, too, for a spring crop. From an experience of several years, we commend this crop to all farmers who keep pigs or sheep, for which it is especially adapted, and also for young stock. The autumn frosts do not injure the leaves, and this green food helps to carry the summer well into winter.

Care of the Hennery.

A good whitewashing, with fresh lime, at this season of the year, will destroy the vermin found in almost every hennery, which will be a great relief to the poultry. A foul hennery is a persecution to poultry and keeps them from laying. A few cents' worth of lime and a few minutes of time will do the work effectually.

VARIOUS TOPICS.

Sowing Wheat.

I THINK that usually much more wheat per acre is sown than is necessary and more than will give the best results. Last year I sowed five pecks upon an acre and a quarter. It looked very poor and thin in the fall, but at harvest time it was the best-looking piece that I had. I got 46 bushels from it, which was a much better yield than I had from any piece seeded with the usual amount—a bushel and a half. It stood up better than any other also—variety, Clawson. It would give valuable results if all would try different amounts of seed, and see which would give the best result, each reporting the outcome of his experiment.

Rolling Ground.

Rolling wheat ground, even when not cloddy, is not sufficiently practiced. Last year, in plowing for wheat, the headlands were tramped so hard that when sown, the hoes of the drill could hardly penetrate the soil. The field was rolled, but, of course, it was not rendered as compact as the headlands. Through the season there was a noticeable difference between the wheat on the headlands and that on the remainder of the field, in favor of the former.

Borrowing Tools.

In every neighborhood there is some one who never has any tools and is always borrowing of others. Whenever a hoe or a shovel, a plow or a harrow, a hammer or a saw, is wanted by him, this person must borrow it. Probably he does not want to use it more than five minutes, and it takes him three or four times as long to get it. I do not speak of his returning it to the owner, for that he never does. When the latter wants it, *he* must go for it, thereby losing his time and generally his patience also. This class rely on their neighbors to furnish them with every tool they use. The practice is unprofitable for the borrower and both unjust and unprofitable for the lender.

Tools are worn out or broken and the damage seldom paid for, and should one venture to hint that it would be nothing more than right to pay for a broken tool, these borrowers are usually very indignant. By all means, let every one own the smaller tools of every-day use himself; and if he cannot afford to buy the more expensive machinery, let him unite with others and own it in partnership—an arrangement which would enable him to have the use of several machines for the price of one, and which has the merit of economy if not of convenience.

V. J. EMERY.

Henry Co., Ohio.

EXHAUSTED SOILS.

IT is assumed by some that a soil by long-continued cropping is exhausted. This may, in one sense, be true. If the crops raised do not pay the expense of raising them, the soil is called exhausted; but it is not, and fails to yield paying crops only on account of a bad system of tillage. There is but little, if any, land that will not grow good clover crops, even on exhausted soils, without any fertilizers, while all will if properly fertilized at an expense of less than five dollars per acre.

A crop of three tons per acre of clover contains the following constituents: ash, 399 lbs., potash, 117, soda, 5.4, magnesia, 55.2, lime, 153.6, phos. acid, 44.8, sulph. acid, 13.6, chlorine, 16.8, sulphur, 16.8, and nitrogen, 127.8. With this it is interesting to compare the constituents of the following crops:

	Ash.	Potash.	Soda.	Magnesia.	Lime.	Phos. A.	Sulph. A.	Chlorine.	Sulphur.	Nitrogen.
Wheat, 40 bush. and straw.....	221	33.8	6.4	9.8	12.3	29.3	5.9	—	10.3	63.0
Rye, 50 bu. and straw.	352	63.2	16.2	13.4	20.6	34.2	6.2	—	10.1	68.4
Corn, 50 bu. and straw.	166	76.8	2.6	15.8	20.9	31.7	10.3	—	19.2	68.0
Potato's, 300 bu. & tops.	232	120.0	3.6	16.4	24.1	26.4	15.6	8.8	6.4	81.0
Turnips, 500 bu. & tops.	309	109.2	30.6	12.6	51.0	37.8	41.4	16.2	15.0	66.0
Cabbage, 10 tons.....	248	120.0	10.0	8.0	38.0	40.0	21.0	6.0	10.0	48.0
Tobacco, 1 ton.....	—	108.0	14.6	41.4	146.3	14.2	15.4	17.6	—	92.0

These facts show that clover abstracts from the soil more than any of the above crops, which are larger in quantity than are usually obtained, even when the soil is considered highly manured. Soils are not exhausted when a suitable crop has the power to change and liberate the insoluble substances existing in the ground, and store them in the plant for other purposes. By the growing of clover there is also left in the soil, to a depth of ten inches, 6,580 pounds of clover roots containing 77 lbs. of potash, 19 lbs. of soda, 46 lbs. of magnesia, 246 lbs. of lime, 71 lbs. of phosphoric acid, 24 lbs. of sulphuric acid and 315 lbs. of nitrogen, available for a crop which, when plowed, leaves the land clean, light, retentive of moisture, and easily tilled. The constituents in the clover roots are in quantity as much as most of the above-mentioned crops require, and amount in value at the prices at which commercial fertilizers are calculated to, $40.42 for the nitrogen, phosphoric acid and potash alone, to say nothing of the other constituents which are equally important to the growth of crops. The necessity of purchasing fertilizers, and the cost of applying them are saved, and the farm made, as it should be, self-supporting, but it can only be so by a judicious rotation of crops. If this is not done, fertilizers which are much more costly, must be supplied. It is most profitable to cut the clover the first and second years, and after the second year's crop is taken, allow it to seed which save for future use, and then the land is ready for the plow for the ensuing crop. The term exhausted land, therefore, does not mean that the soil is destitute of a supply of crude plant-food ample enough for the production of many heavy harvests, but merely that enough of the abundant stores is not soluble, or, in other words, in a condition fit to be absorbed by the plants.

The Apiarian.

EXTRACTED HONEY.

REV. O. CLUTE.

THE market reports in the large city dailies give quotations of "strained honey." All know that strained honey was formerly pressed out of old black combs that were taken from the box-hives after the bees had been brimstoned To any one who ever saw honey strained in the old way, its association with the juices of half-grown bees is by no means appetizing. At the best it usually has a dark color, and a rank flavor of bee-bread. As to its production, all intelligent bee-keepers will agree in the advice given by Punch to couples about to get married—"*Don't.*"

A serious evil which strained honey has created is the tendency, among nearly all, to put all liquid honey in the class with it, and so to do great injustice to "extracted honey." Extracted honey is honey in its purest shape, and to class it with the pollen-spiced, maggot-flavored, strained honey, is like putting the nectar of the Olympian gods on a par with forty-rod whisky. All bee-keepers should endeavor to have the real character of strained and of extracted honey fully known, and should labor to convince the public that extracted honey is in the purest and most cleanly condition. Like all new articles of food, it will take time to make its merits widely known. When people become acquainted with its real merits, and its cheapness, there is no doubt but it will be in large demand.

But this wide popularity can be obtained and maintained only by producing an excellent article. To this end bee-keepers must strenuously insist upon two things: that the honey shall be sealed, or just ready to be sealed, before extracting; and that it shall have no suspicion of adulteration.

The nectar gathered by bees from flowers cannot be called honey until the evaporating or ripening process has so far gone on that the bees are beginning to seal the cells. Some bee-keepers advocate extracting as fast as the honey is gathered. It is quite clear, however, that honey so extracted lacks very much in the delicious flavor that belongs to a good article. If we are to build up the market for extracted honey, we can do so only by giving a genuine honey, and not the crude, watery nectar as is first gathered from the flowers.

The ease with which extracted honey can be adulterated, and the large profits derived from the cheat, have in a few cases led to such dishonest practices as seriously to injure the bee-keeping business. There are probably only a few individuals and a few firms that have been guilty of this fraud, but their guilt is a damage to every bee-keeper throughout the country, for, in the general ignorance as to extracted honey, whatever tends to cast suspicion on it, decreases the demand for it, and so lowers the price. Hence there has been need on the part of bee-keepers for agitation against the practices of the unscrupulous men who are selling glucose or grape sugar for honey. We may hope that the conviction and punishment of a few of these scoundrels will effectually end the fraud. In self-protection, the various local and State organizations of bee-keepers, and the National Association, should employ experts to examine all suspected honey, and should prosecute vigorously every person against whom good evidence of adulteration can be found.

Comb honey has such intrinsic qualities of excellence and beauty that it will always be in demand. A pure article of well-ripened extracted honey also has most excellent qualities which, when known, will commend it to wide favor, and secure for it a large consumption.

Johnson Co., Iowa.

Dairy Husbandry.

PACKING BUTTER FOR WINTER USE.

HENRY STEWART.

The fall growth of grass, which nearly everywhere in the Northern States consists chiefly of "blue grass," is productive of excellent butter. September-packed butter equals the noted June butter, and it is doubtless to the fresh growth of grass that is started by the early fall rains that this excellence of the butter is due. September butter is the best to pack for winter use; for being packed and kept during cool weather, it has an advantage over June butter in freshness and age, when it is opened for consumption. It goes without saying, that to have good winter butter, the best method of packing should be used, and the butter should be good. The best of packing will not make poor butter good; although it may redeem inferior butter from further degradation; but bad packing will ruin the best of "gilt-edged." There are but few requirements for good packing, but each is indispensable.

The butter must be packed while perfectly fresh. Immediately after the final working it should be put away in the packages. If only but five or six pounds, it is safe there; while if kept in a lump or roll, it is exposed on all sides to the air, begins to spoil from the first and communicates its taints to the whole contents of the package with which it is intermingled. The salt should be pure. Only the best of dairy salt should be used. One ounce to the pound of butter is the proper quantity. The package should be perfectly clean, fresh and sweet. A new white-oak pail should be chosen, the larger the size the better, because there is less surface exposed to atmospheric influence in large packages, and a 50-pound tub may be packed safely in a month, a part at a time, if rightly done. The tub should be stored in a clean, cool, airy, moist place, but one perfectly free from moldiness. A good cellar with a brick or cement floor is suitable, but it should be free from all taints or odors. The butter having been churned, is worked free from butter-milk, and an ounce of salt, finely pulverized, to each pound—weighed, not guessed—is added, evenly worked in by gashing the lump with the paddle, sprinkling the salt, then turning and gashing again. The butter should never be plastered or smoothed over with the ladle, but cut and gashed and turned, and cut again. It is gathered into a lump and put away for 24 hours in a cool place. It is then reworked in a similar manner; the milky brine that escapes is all worked out, and a little more salt is added, if thought desirable. When quite free from milk it is put into the package.

A glazed stone-ware crock of three or four gallons is, perhaps, the best for a small dairy. Next is a new white-oak 50-pound pail. The package must be clean, and, if of wood, should be scalded with hot brine a day before using it. When prepared for use it should be finally rinsed in cold brine, a little dry salt sprinkled over the damp inner surface, and the butter packed in with a ladle, pressing firmly to close every open space that would admit air. A plastering motion of the ladle is to be avoided, and pressure only to be used. This preserves the grain. If the package is not filled, the butter is covered with a clean piece of muslin, cut to fit all over closely, and then with cold brine; and the tub is set away in a proper place, covered with a cloth.

When more butter is to be packed, the brine is poured off, the muslin removed, the lower layer of butter is sprinkled with a little fine salt, and the fresh butter is packed as before. This is continued until the package is filled to the top. Then salt is sprinkled over the butter, a clean piece of white muslin, well washed previously, is fitted closely over it, and the lid, well cleansed, is fastened down tightly. The tub, then put away in a fit place, may be kept for a year; and, if the butter was good when packed, it will open as fresh and sweet as at the first, and, indeed, with a peculiar nutty flavor which is found in mature and well-ripened butter, and is absent from all the fresh butter which I have ever tasted.

Industrial Societies.

BRITISH AGRICULTURAL SHOWS.

PROFESSOR G. E. MORROW.

LEEDS, Eng., August 7th, 1879.

THE opportunity has been afforded me of being present at four Agricultural Shows in England and Scotland in the last five weeks, viz.: that of the Royal Agricultural Society of Kilburn, near London; that of the Highland and Agricultural Society of Scotland, at Perth; the Border Union Show at Kelso, and the Yorkshire Society's, which has closed to-day at Leeds. In many respects there has been similarity in these, although the Kilburn show was the most extensive one ever held, and that at Kelso would only rank with an ordinary County Fair in "the States." In some respects our managers of agricultural societies could copy with advantage the plans here used. In others I like our own arrangements better. Among noticeable characteristics I may name:

1. Systematic and careful arrangement of the grounds and of the exhibits, which are all classified. Even at Kelso, where a fence was the place assigned for the cattle, and rows of posts, with a single board along the top, indicated where the horses were to stand, the place for each class was indicated by large cards plainly printed, and for each animal by cards bearing a number corresponding to that worn on the forehead or breast of each cow or horse. No exhibitor was permitted to collect his exhibits in one group. If he showed draft horse and a roadster they did not stand side by side. At the large shows diagrams of the grounds are published, showing the part in which any class of machinery or of animals is to be found. A good effect is produced by arranging the implements and machinery in

sheds or open spaces about 20 feet wide, with wide avenues between.

2. Entries are required to be made some weeks in advance of the show, thus giving opportunity for making the classification and for issuing a catalogue giving information which enables any visitor to examine the entries without questions and at his convenience. These catalogues are sold at a shilling or sixpence each; sometimes they have advertisements inserted, and the sale would serve to meet the cost.

3. The awards are generally all made and announced on the first day of the show. The public is admitted, but a special high price is charged. At the larger shows the judging of horses and cattle is done in "rings" specially prepared for the purpose, each with a post in the center on which the number of the class being examined is pasted, as well as the numbers of the animals receiving prizes in their proper order. At Kilburn and Perth special prize-list catalogues were issued and on sale the morning of the second day. The judging impressed me as being very carefully done; in cattle the age not being considered sufficient, the animals being handled to determine their quality.

4. The programme is carried out on time—if the weather permits. I do not remember a case in which judging or a parade was commenced ten minutes after the time announced.

5. Prominence is given to daily parades of horses and cattle. They are brought out by classes, each bearing its number and the prize-takers marching at the head in their order. The procession moves slowly once or twice around the ring. At Perth there were two parades daily. These give an excellent opportunity for examining and comparing the animals, and for commending or dissenting from the awards made.

6. There is no "special ring." Neither at Kilburn nor Perth did I see a horse show in harness. At Leeds some special prizes offered by the local committees were competed for by single horses or carriage teams. At Perth and Kelso arrangements were made for testing the ability of hunters in jumping hurdles and ditches.

7. Except for a rather wide range of articles in the machinery and implement classes, the shows are very strictly agricultural. No side shows are admitted into the grounds. The classes do not cover a wide range. Farm crops are nearly or quite ignored. Except in the fine displays made by seedmen, I have not seen a bushel of grain or of grass-seed, or a specimen of roots, vegetables or fruits. Even dairy products had no place at Leeds.

8. Most of the sheds and buildings are canvas-covered. Without the disadvantage of ordinary tents, these sheds are light, easily put up, turn even heavy rains well, and give an opportunity for using the same material at different shows. The horse sheds are boarded tight on either side, with a wide covered space back of the stalls, along which visitors can walk and examine the animals at any time.

9. The refreshment stands furnish good food at rather high prices, and intoxicating liquors in great variety. The societies do not seem to recognize the probability that any one would like to drink water. Soda and other mineral waters are sold, as well as tea and coffee; but many prefer, if they must pay for drink, to buy beer, wine or whiskey. But little drunkenness is seen, and the good order is quite noticeable.

Among prizes not common in America, I have noticed, at one or the other of these shows, the following: "For farm laborer's cow; for stallion to make the next season in the district where the show is held, and at a fixed low fee; for the best collection of farm horses, to include half of the working force on the farm; for "families" of cattle.

11. Much seems to be made of banquets and dinners, at which toasts are made and responded to, sometimes at much length. At one I attended at Perth there were 38 speeches in proposing and responding to toasts, taking some three hours for their delivery. In most cases a nobleman is president of the society.

At each of these shows the weather has been bad, more or less rain falling. The attendance has been good, however. With nearly constant rain here, 31,000 persons attended the Yorkshire show yesterday. Leeds is a large city, and the attendance was much increased by the townsfolk.

As a whole, I have been much pleased with each of these shows, and think I have learned useful lessons at each.

Miscellaneous.

MISCELLANEOUS NOTES.

S. RUFUS MASON.

Gardeners' Talk.

Ask a gardener what kind of soil you should use for such and such plants, and he will reply, a "loose, mellow, rich and well-drained one." It matters little what plant, bush or tree you speak of, that's the condition the soil must be in. Take any soil on your place, sandy, clayey, loamy, gravelly, or even stony; make it as above, and the plant must do well. Here is the whole secret of successful and profitable growth. If you are building a house for yourself, plow, subsoil, drain, manure, plow again, harrow the garden fine, and drain with tiles if necessary, but let it, before planting, possess the four cardinal virtues, and there can be no such word as fail. The best farms are but facsimiles of this.

Lime for Poultry.

There are a hundred ways proposed to obtain lime for egg shells, bones, etc., for our hens. Some of these are of the most curious kind. One would suppose that lime was one of the rare substances in this world. Burnt oyster or clam shells, burnt bones, even egg shells themselves, are recommended. Teaching a hen to eat her own eggs is best done by throwing the shells to her. How many folks in the country have oyster or clam shells? Then again, gravel—hen's teeth—is not as often supplied as it ought to be. A late writer actually recommends pounded bits of glass, or quecusware as being better than gravel. How strange to see people going so far out of the line of common sense! Now, both of these very difficult things to accomplish for the health of our feathered bipeds are easily done by making a mortar of small gravel and lime, in the manner of stone masons, and when the mortar becomes hard, breaking it up small with an axe. Keep this little piece of "necessity" always before the hens and burn all egg shells, and the moral and physical character of the hens and their husbands will be in the ascendant.

Young Chickens.

This season has been remarkably dry. Young poultry have had a fine chance, and could forage for themselves without trouble. I have not fed a brood this year. Too much soft feed of the mush sort does not make the chicks grow in a healthy manner. They depend upon us for food, lounge around and do not get exercise enough. In wet weather they should be fed, but do not encourage laziness or begging among poultry. My stock of hens—60 in all—have given us 3,387 eggs since January 1. We have used all we wanted—about 500—and the sales of the balance have paid 150 per cent. on the value of the stock, and besides, we have raised a good lot of young. They are never fed, except in extremely unfavorable weather, are good foragers, and nothing eatable in their line—grain, seeds, worms, grubs and insects in general—escapes them. They are always fat enough to kill; their combs are of a brilliant red; they sing all day, and are as happy as clams at high water. I use no nostrums to destroy hen lice; give them a dry house; keep no dog to annoy them; teach the cats to respect them, and have never had disease among them. They are a cross between a Houdan rooster and Light Brahma hens.

"All Killed by the Frost."

What a common remark this is every spring! while it is not true in one time out of fifty. Trees, plants, etc., etc., which are naturally hardy, die every winter, because the cultivator violates an important law of nature. No plant can live through a cold winter without sufficient moisture at the roots to keep it alive and in working order. During September, October, November and December, the usual droughts and high winds exhaust all the moisture from the soil about the roots, leaving them nearly dead from that cause alone. It is little wonder, therefore, that frost finishes them. Now, Nature mulches everything so well that the moisture is retained, the plant lives and grows all winter. It takes a very low temperature indeed, to kill a tree, if the roots can still perform their duties. Now is the time to mulch everything, the more tender the plants, the more protection they require.

Scientific Terms for the Million.

It is quite common among a certain class of agricultural writers to use terms not understood by farmers, and as books of reference are seldom found in a farmer's library, the whole article becomes valueless. It is quite common for agricultural editors themselves to copy from foreign journals accounts of crop yields expressed in the weights and measures of the country where the crops grow. Here is another difficulty which few can surmount. Even sums of money are deceptive if given in foreign currency. Everything should be in plain English; money, weights and measures should be reduced to our terms, and then if the reader could not understand, he should go one more quarter to night school.

FIRE INSURANCE.

In the RURAL of Aug. 2 I notice an article headed, "Does Insurance Against Fire Cost Too Much?" in which the writer goes on to show that, notwithstanding the enormous losses by fires in large cities, and the great expense attendant upon the management of stock companies, in the shape of officers' salaries, agents, etc., the average rate of dividends of such companies is from 8½ to 14 per cent. He cites one company, with a capital of less than $200,000, whose president and secretary received each a salary of $15,000 a year, and adds, "The trouble is, it costs too much to run the business."

Now, why do not farmers insure themselves? Why should rural property, which runs but small risk of loss by fire or lightning, pay the losses in large cities? If farmers would organize mutual insurance companies in which to insure their property, the cost to them would not be a tithe of what it is in the stock companies. This is not theory, for it has been demonstrated repeatedly. In the town of Ripley, Chautauqua county, N. Y., there has been such a company in existence nearly or quite 25 years, and although property in the village is also included, there have been but two fires during the existence of the company, amounting in the aggregate to $1,000. The whole cost to the insured for the 25 years has not been more than one-twentieth of one per cent.

In several counties of the State the Grange has organized fire relief associations, in which the insured agrees to pay his pro-rata assessment of all losses which may occur; and although there had been no laws which would oblige one to pay until they were passed by the last session of the Legislature, I have yet to learn of a single instance in which the loss has not been promptly paid, and this, too, without the interposition of adjusters, and the cutting down of just claims, as is frequently the case in stock companies.

We have such an one in this county, which has been in existence two years, with something over $200,000 insured. We have recently had one fifty-dollar fire, the loss by which has been promptly paid. The cost of insuring is extremely small, being one-seventh, one-eighth, one-ninth and one-tenth of one per cent., according to the class of building and exposure to risk. The insurance runs for five years, instead of three, as in most of the stock companies. And this is all the expense, unless a loss occurs. The property is taken at a low valuation, as it is thought if each man carries a part of his own risk, it will have a tendency to make him more careful, and the company does not intend to offer any premium for rascality. Then, if a loss occurs, the assessed have the consolation of knowing that each man's money goes directly to relieve the necessities of a brother, and not to build marble palaces, or to pay $30,000 a year for salaries of two men, or to buy whisky and cigars for agents.

Our last Legislature passed an act, in May, to legalize the formation of mutual insurance companies, in both town and county, with power to collect assessments; and now all that seems necessary to secure cheap insurance is to organize under this act. There is a lamentable lack of confidence in farmers, not only toward each other, but in their own business ability. Here the Grange, together with such papers as the RURAL and other first-class agricultural publications, comes in as a great educator, slowly but surely lifting the masses out of ignorance and prejudice and teaching them to look to themselves for protection against sharpers and swindlers of all kinds, and to trust in their own ability to carry out such business projects as concern themselves alone. G.

Jamestown, Chautauqua Co., N. Y.

Brockworth Park and Bonne D'Ezee Pears.

THE pear sent out from England a few years since and heralded in this country with a sound of trumpets as a new variety under the name of Brockworth Park, is an old sort, Bonne d' Ezee, or Bonne de Zees. This has been proved to the satisfaction of pomologists in this section from the garden of Mr. Jas. H. Ricketts and the orchard of Mr. T. S. Force, north of this city. A. A, B.

WHAT OTHERS SAY.

Raspberries.

MR. E. WILLIAMS, of Montclair, communicates the following to the Cincinnati Horticultural Society: "We are trying the Gregg, but must wait till next season before we can form any opinion. The Ganargua is large, but the color being neither red nor black, it is of little account. The New Rochelle of same color but larger, makes a splendid show at first, but the color would kill it as a market fruit, and the quality is only medium, or below. Highland Hardy is very early and good, but too soft and perishable for a distant market. The Thwack was introduced here some years ago as the best that ever was. We invested $2 in them, but "nary" a plant grew; killed in advance, I suspect; plenty of like experience hereabouts; have not heard favorable accounts enough of it since to induce us to try it again, but it seems Mr. Ohmer regards it favorably.

A word as to the identity of Miami and Mammoth Cluster. It was originally sent East by Western parties as Miami Black Cap, but when prices declined and they were slow of sale, certain parties moved it to New York State, and re-christened it Mammoth Cluster, made a great ado about it, and no doubt made money by the operation. It was not until the trick was discovered and exposed that an effort was made to cover up the fraud, by pretending that there was a smaller berry from Southern Ohio known as the old Miami, to which the name properly belonged. We bought some of the newly-baptized infant at $20 per 100, and they proved the same thing we were selling at $5. We have discarded them both. They are identical—a week later than Doolittle, a little larger, but not as good.

CONTRADICTORY stories as to Pearl Millet appear in other journals as well as in the RURAL. We extract the following notes from the Country Gentleman:

PEARL MILLET.—Having heard a great deal in favor of the Pearl Millet as fodder for cattle, I sent for a very small quantity of seed last spring and sowed it in drills in a good spot It has not come up. I am sorry, as I was quite anxious to know how it looked. I think, no doubt, the Pearl Millet will do well in Africa and some of the Southern States. O. H. A.

Charlotte, Vt., July 28.

I bought eight dollars' worth of Pearl Millet seed, and sowed it May 20th, in drills. Directions were followed to the letter, with great care. The last of June I plowed up one-half of it, and planted corn for fodder. The Millet is a total failure. D. N.

Waukesha, Wis.

My experiment with this valuable forage plant has been a success. I get more feed from 40 cents, than I ever saw, on a plot of ground 30 by 300 feet, sowed in drills two feet apart. The second growth, where cut July 15th, is now two feet high. I think, from my small experiment this season, that I have learned something about growing Pearl Millet. Peter Henderson tells a good story about Millet, but I have reason to believe that, under proper cultivation, it can be realized. I. H. C.

Old Westbury, L. I., Aug. 1st.

WE have just learnt that Messrs. Smith & Powell, of Syracuse, New York, have imported 24 additional Holsteins, while Mr. W. B. Smith will leave Holland in a few days with 50 more, making 110 in all imported by them within a twelvemonth. Six carefully selected Clydesdale stallions will also accompany Mr Smith on his return.

PAMPHLETS AND CATALOGUES.

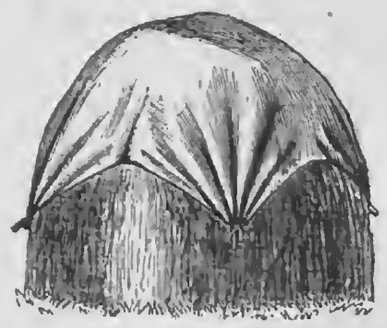
CATALOGUE and description of Wier's new hardy Seedling Cherries and other fruits and plants grown from seed by Daniel Wier, proprietor of the Lacon Nurseries, Lacon, Marshall Co., Illinois. We have heard much—first and last—of Mr. Wier's seedling cherries (we have given an account of some of them in these columns), and are glad to know that they are offered for sale. The introduction of Wier's seedlings may serve to recall an interest in cherry culture, so much neglected of late years.

DUTCHESS NURSERIES—Summer list of Strawberry plants, pot grown and layers, W. P. Ferris, Prop., 387 Main St., Poughkeepsie, N. Y. Mr. Ferris succeeds to the late firm of Ferris & Minard.

Industrial Implements.

HAY CAPS AND STACK COVERS.

The hay crop has become such an important one, and at the same time prices for the staple rule so low that it is to a farmer's best interests to husband every pound, and try to avoid the reproach of carelessness in handling it. Now,



if ever, it is the many a mickle that makes the muckle. A great source of waste, both of time, money and material, is the wetting cured hay is likely to receive while in cocks, or being stacked, because of sudden rains. This is easily prevented by the use of canvas covers that are adjusted in a few minutes, and act as an efficient protection. We have frequently had inquiries where to get them, and we were, at one time, asked by a Grange to purchase a quantity of duck and make some up for the convenience of our readers. We have seen, recently, some covers, both for stacks and cocks, made by a Chicago firm, Gilbert, Hubbard & Co., which are cut in the proper size and nicely finished with an eyelet and rope in each corner, which render their fastening easy. They are sold at reasonable prices, and made of the best material.

Everywhere.

BEYOND THE MISSISSIPPI.

To the majority of the inhabitants of the Eastern States, the term "Beyond the Mississippi" conveys a vision of herds of buffaloes roaming at will over their native hills; of bands of painted Indians, gay with beads, feathers and blankets, and bristling with spear, tomahawk, and arrows, and many imagine the millions of acres toward the setting sun to be one vast plain, without dwelling, or civilized inhabitant. They fancy that civilization paused in its westward march when it arrived at the eastern banks of that mighty river that rolls onward toward the Gulf. Could they but see the right side of the picture, their love and admiration for their native States would only be equalled by the homage they would offer to their sister States beyond the Father of Waters.

Last week for pleasure as well as business, I took a short trip northward on the St. Louis, Kansas City and Northern Railway, my objective point being Queen City, a little town of about 400 inhabitants, situated in Schuyler Co. For the sake of seeing the country, crops, etc., I took a seat in the caboose of the noon freight; the passenger trains having a bad habit of running in the other direction, and at the wrong time of day. The road led up the divide, and far in the distance on the west I could see, outlined against the sky, the belt of timber that marks the course of the Chariton River; while directly along the line of the road and fringing it on either side were fields of corn and Hungarian grass and beautiful meadows thickly dotted with hay shocks and redolent with the fragrance of the new-mown hay. At Queen City, as well as at all other towns on this road, there is a good business done in railroad ties, bridge timber, piling and hoop poles. This is a great advantage to the merchants, as the contractors pay very largely in store orders. The shipping consists of oats, hay, corn, hogs, cattle and sheep. Freights per car-load are from $20 to $40 each—distance to St. Louis, 218 miles. Oats are shipped for $26 per car load, hay for $20. Last year hog cholera visited this section and about depopulated the pig-pens, in many instances the whole drove being swept away. In this section no remedy has ever been tried that does the least good. If any of the readers of the RURAL know a remedy that is *sure*, he should publish it for the benefit of the world.

This year has been the best for corn and other grain, that we have had in ten years. Everything looks fine, and corn bids fair to yield from fifty to sixty bushels to the acre. In common seasons, the average is from thirty to forty bushels. Hay is always light here, as farmers generally have not learned to feed their land. If the manure that is allowed to go to waste, were spread upon the meadows and corn-fields, the crop could be doubled in five years. The yield of hay varies from one-half to one ton per acre. A great many farmers depend on wild hay, as a very good quality can be cut on the Chariton bottom lands for just the labor of securing it. Oats yield from forty to fifty bushels to the acre. This year the yield of wheat is fine, and I was told that Schuyler county raised enough for home consumption. In the timber lands there is no reason why farmers should not raise their own breadstuffs all the time, for the soil is adapted to wheat growing and the land well sheltered. I was told last fall by an old granger that he had failed to get a good wheat crop only twice in seventeen years. He would not fail where others would starve, for he had nearly one hundred stands of bees, and a beautifully kept vineyard of Concord Grapes.

Last winter was the most severe of any known to that wonderful oldest inhabitant, who is the oracle of all little one-horse towns. The peach trees gave up the ghost without a struggle, and everybody that eats peaches this summer has to pay two prices for them, and depend on Arkansas and California for his supply. The soil and climate here seem to be especially adapted to fruit-growing. The small fruits are finer and better-flavored than I ever saw them in New York. The timber lands are generally spoken of as "not good for much," but they beat the prairies for fruit and wheat, and in wet seasons they are better for corn.

The great wants of this country are men with some capital and a great deal of enterprise. The majority of farmers here are in debt. Having invested every cent for land, they of course had to run in debt for team, tools and seed. The failure of crops for a year or two brings a mortgage on their land, and their lives are one long struggle to pay interest—a grievous load which a little forethought might have prevented. It does not pay in Missouri—or in any other place—to be land-poor. Two or three hundred acres of unfenced, unimproved land to pay taxes on would swamp a well-to-do man in five years, unless he sold it. In a former letter, published in the RURAL of July 26, I made a statement in regard to the society here, and also concerning the welcome which Eastern men receive at the hands of the average Missourian. On looking it over, I fear that it will not convey to the mind of the reader the exact meaning I intended to impart, so I will again touch upon the same point. Ten years ago the political differences between the North and the South were much more pronounced than now. The ill-feeling between the two has gradually been growing less, until in this section there is but little to choose between the two parties, and the balance quite frequently is in favor of the Southerner. The more advanced ideas, and better—because quicker and cheaper—methods of farm work practiced by the Yankees—and everything east of the Mississippi is Yankee to a Missourian—are copied by his neighbors, and very many of the Yankees copy the Missourians. When both parties have sense enough to be generous towards the pet notions of the other, and eschew political differences, they each prove to be a benefit to the other. A great deal of trouble is occasioned by those hot-heads who esteem it their bounden duty to convert all their neighbors to their own way of thinking. These malcontents are not confined to *one* political party, but belong to *all* parties, and not infrequently to *no* party. I do not wish to be understood that an Eastern man cannot bring his family here and live in security and enjoyment; but unless he has the good sense to hold his tongue, the chances are that he will learn what kind of steel the Missourian is made of.

Missouri is by no means a wilderness. If you will examine your United States histories you will find that Missouri became a State in the year 1821. It is inhabited by people whose opinions are already formed. It is already well up in the arts and sciences, in horticulture and agriculture. It boasts of three Normal schools, an agricultural college and a whole mountain of iron. This being the case, it is the hight of folly, to say the least, for a man to come to this State with the expressed purpose of "setting up his household gods," and at the same time setting himself in violent antagonism to his surroundings. If you feel that you cannot live here on good terms with those you differ from in opinion, the best thing for you to do will be to stay where you are, for you are the man I meant in my first letter. If you are a farmer, discuss corn, wheat, plows, sulky rakes, two-horse cultivators, rotation of crops and the best plan for running farm operations generally. If you are a stock breeder, talk Devons, Short-horns, Alderneys and Jerseys. If you are a dairyman, converse with your neighbors about the profits of butter and cheese. In short, no matter what your calling, attend to your own business, save your manure, and read the RURAL and five or six other papers or magazines, and you will be certain to succeed, and will never regret the discipline that helped you to gain a competency.

BESSIE VICTOR.

Sublette, Adair Co., Mo.

RURAL SPECIAL REPORTS.

MASS., North Leverett, Franklin Co., Aug. 18.—My corn looks very thrifty but I fear it will not get out of the way of the frost next fall. I can count seven ears on some stalks; some are just silking out; other ears are just coming in sight. My tomatoes look well, but the frost last spring put them so far back that there are no ripe ones yet. The frost hurt my Pearl Millet very badly also, but some of it is beginning to grow now and looks pretty well. My potatoes look well, the vines are dead. I have not dug any of them, but I think that they will yield well. Potatoes generally are a good crop about here, of good size and mealy. C. C.

NEW YORK, Burtonville, Montgomery Co., Aug. 15.—I planted my Blount's corn on the 19th of May, on soil that I had raised a heavy crop of winter wheat on the previous year. No commercial manures were used, and the corn stands to-day ten feet high, on an average, and is throwing out from five to eight ears to the stalk; and about two-thirds of the stalks have thrown out from one to four shoots that stand nearly as high as the parent stalk and also have ears. I planted my corn one seed to the hill, making 123 hills, as I received that number of kernels. Of these, 109 came up and commenced growing as if they meant business. It is certainly a curiosity to look at, as it stands to-day. It has thrown out roots from the first joint, six inches above the level of the ground, as large as a pipe-stem, which run down at right-angles and penetrate the soil, as I suppose nature intended it should, to support the heavy weight of ears and stalk. The corn is quite an attraction to my neighbors who come quite a distance to see it. One day last week one of the neighbors called to see me, and found me in the corn at work. As he came up on the opposite side of the patch, he yelled:

"Hello! where are you?"

"Here," I replied.

"Well," said he, "this beats all the corn I ever saw! No wonder though, as I have seen you in here every morning at work."

The facts are that I did visit it every morning at first to watch the cut-worms, but in spite of my vigilance they destroyed one hill. I think, however, that I stand a pretty good chance to get one of the prizes, unless an early frost should interfere with the prospects. The Defiance wheat the RURAL sent me, was sowed late, but is looking well; the Pearl Millet, on the contrary, was a complete failure. The crops in this section are pretty fair this year, and there will be about an average yield. N. S. G.

N. Y., Mountainville, Orange Co., Aug. 9.—The Beauty of Hebron potatoes are a success. There were 23 eyes on the pair I got. I cut 21 sets and all brought nice tubers which I dug up and put in the cellar three weeks since, and turnips are now growing where they grew. I did not treat them better than the others in the garden, which were Early Rose, and the Beauties are fully as fine—which is saying a good deal, for mine is a magnificent crop. The Early Rose were planted in April—the first week—the Beauties we set in a box and brought into the house at night or covered it over with a carpet; they were up and transplanted just as the others were up, so that it was a pretty equal start. I have just commenced digging up the Early Rose, so that there is about two week's difference as regards being early, but in other respects equality exists. I have an eighth of an acre, and judging from the few rows got up to-day, which, as stated, are very fine there will be 50 bushels—in fact there were 51 short rows and I have had over a bushel per row. I forgot to say I had nearly three pecks of the Beauty of Hebron, level measure, and just over half a bushel heaping measure. G. G.

N. Y., North Germantown, Columbia Co., Aug. 16.—We are having a splendid rain to-day—the first in four weeks. Everything began to show the effects of the drought except Grapes, which promise a full crop. Plum trees are looking bad, being covered with black knots, and now the leaves are falling off and exposing the fruit. Pears are a full crop, but some orchards are being ruined by the blight. My neighbors all express surprise at my Blount's corn, as it is the tallest and best-cared they ever saw. In hight it ranges from ten to fourteen feet seven inches, with from three to six ears to each stalk. G. E. L.

N. Y., Johnson's Creek, Niagara Co., Aug. 18.—I have dug my Beauty of Hebron potatoes, and find 30 potatoes weighing five pounds and three-quarters, being the proceeds of the potato the RURAL sent me last spring. The seed potato weighed 1¼ ounce. Prospects are good for a large crop of peaches and an average crop of apples. Grain crops, except barley, are good. Blount's corn is 12 feet high and still growing. G. R.

N. Y., West Fort Ann, Washington Co., Aug. 19.—My Blount's corn looks good. Defiance wheat is a failure. Three seeds of the melons grew. I have nine nice melons and some small ones. O. F. B.

N. J., Harbourton, Mercer Co., Aug. 19.—We have just had three days and nights of heavy rain. The ground seldom gets so full of water as it is now. Oats are a good crop, and have been harvested with little expense, as the growth did not get lodged. Early potatoes are a light yield, being few in the ground, on account of dry weather. Corn promises a very heavy yield. My Blount corn is about 14 feet long and of no hight, as it all lies flat on the ground this morning. I can't get the premiums this year. Fruits of all kinds, except pears and grapes, are scarce. Prices of grain are low: wheat, $1.10 per bushel; oats, 30 cents; corn, 50 cents; butter, 16 cents per pound. J. B.

PA., Lineville Station, Crawford Co., Aug 18.—Harvesting is nearly through and farmers are now preparing to sow wheat. Crops have suffered considerably from the drought, but recent showers have revived them, so that they are looking well at present. We are having very cool weather especially at nights. I planted Blount's Prolific on May 29. It is tasseled and silked out, and stands from eight to eleven feet high. Beauty of Hebron has been ripe some time. I have dug one hill and planted for a second crop, but it has not come up yet. The Voorhis watermelon is doing finely. The vines have melons on them nearly as big as a peck measure. S. H. R

PA., Derry Church, Dauphin Co., Aug. 14. 1879.—We have had a very dry summer. There has been no rain of any account since before hay making. Corn needs rain badly. I have just come out of my Blount's corn patch; it looks fine. I had no stick with which I could reach the top of most of the stalks, but I judge most of them are 12 feet or thereabouts, high. It is nearly all in tassel, and most of it shows four, five and six ears, while a few plants have seven and eight. It only needs rain to make it yield "amazingly." The Beauty of Hebron potato the RURAL sent, I made twenty plants out of, and got a peck measure even full of very fine potatoes, all of which I want to keep for seed next year. I tested them with the Early Rose, and they came to perfection about two weeks earlier. The Pearl Millet is a failure thus far, though I attribute it to the dryness of the season, nevertheless if life is spared, I intend to give it a trial next season again. The Acme tomato has been earlier than the Hathaway Excelsior and Trophy, which I also have. It is not so large as either of the others, but for fine flavor, smooth, round shape and fleshiness, I prefer it to either. The beets are beautiful, some have quite light leaves while others are very dark-crimson. Wheat hereabouts was good; oats suffered somewhat on account of drought, and corn in general looks well. Wheat sells at $1; oats 25c; and corn, 42c. per bushel; butter, 10c. per lb; and eggs 10c. per doz; potatoes, 75c. per bushel. E. E. B. S.

ILLINOIS, Baileyville, Ogle Co., Aug 13.—The harvest has closed and thrashing has begun. Winter wheat is yielding from 25 to 30 bushels or more, per acre, but the acreage in this locality was not large. More winter wheat will be sown here this fall than ever before. Rye is also a good crop, but the spring wheat and barley are light, though the quality is better than last year. Oats are a fair crop. Not enough grain has been thrashed yet to enable us to estimate correctly the general average. The spring drought and chinch bugs did considerable damage. The experiment of sowing salt on wheat-land, near Rochelle, in this county, did not prove as beneficial as it did last year. Corn is very promising. Potatoes and vegetables are plentiful but the cabbage-worms are injuring the cabbages greatly. Since harvest has closed the farmers have been busy "cleaning out" their granaries and corn-cribs, preparatory to filling them with their new crops; so there is a pretty large amount of grain being marketed. Good and enterprising farmers are preparing for the agricultural fairs. Our State Fair will be held at Springfield, Sept. 29 to Oct. 4., S. D. Fisher, Sec., Springfield, Ill; the Ogle County Fair, at Oregon, Ill., Sept. 9th, 10th, 11th and 12th., John T. Gantz, Sec., Oregon, Ill. Attend the fairs, and if you have anything to exhibit, send to the secretaries for premium lists. W. B. D.

MICH., Matherton, Ionia Co., Aug., 14.—I think that my corn will have a fine start for next year, for I expect to winter it over in order to have it get ripe. It is now from ten to twelve feet high and just beginning to set ears. Guess I shall have to get some blankets for it. J. T.

WIS., Wiota, Lafayette Co., Augt 11.—The Blount's corn sent me by the RURAL looks fine. It is thirteen feet nine inches high with from four to nine ears to the stalk. The Beauty of Hebron potato is splendid. I have dug only one hill yet. I think this sort about the same as the Early Rose. The Defiance wheat didn't do very well—the rust damaged it very much. I intend, however, to try it another year. L. R.

KAN., Edgerton, Johnson Co., Aug. 12.—My Blount's corn stands from 12 to 14 feet high, with from three to eight ears to the stalk. But the most surprising feature of it is that there are from three to four stalks from one grain, each seemingly independent of the others. The Beauty of Hebron potatoes are earlier, more productive and of better quality than Early Rose. Most of my Pearl Millet has headed out and I believe the seed will ripen here. It stands from six to nine feet high. A. B. D.

MARYLAND, Near Easton, Talbot Co., Aug. 15th.—I am farming lands lying on and adjacent to salt water, in fact almost every field abuts on some cove or creek. These being navigable, we deliver our grain on schooners, and in return they land for us lime or other farm needs. These quiet bays whose shores are fringed with Pines and Cedars, and the prominent points improved with modern residences, resemble lake scenery. The wheat filled finely, and the harvest was a good one. Yields of 40 bushels per acre were not uncommon. The "writer" cut 70 acres, yielding 2,100 bushels of grain of the finest quality. The corn crop made a fair growth during the drought, but near its close began to suffer, as it was in silk and tassel, but our salt air would revive it wonderfully at nights. Since the rains a wonderful improvement has been made; corn has revived, and is caring heavily; pastures have sprung up green at once, and everything has been refreshed. The plows are busy breaking fallow, which is being done in the finest order. The next is our fodder season. As soon as the ears are matured the blades are stripped, cured and shocked, and then stored in the barn, making an abundance of fine horse feed. The tops are next cut, tied in bundles and shocked, and when cured, stacked. The stalks with the ears are carted off, or carried into rows and set up, the ground flushed, rolled, and wheat drilled in, using some fertilizer through the drill. We aim to manure all corn land at the rate of 75 cart-loads per acre in spring. Manures are made by hauling into yards, muck, soil from woods and fence rows, ditch banks, etc., and by backing up two furrows through depressions, and hauling out the excavated soil, which gives drainage. A compost heap near the back build-

ings begun with 50 loads of such stuff, receives the emptyings from the kitchens and slop of all kinds, soap-suds, the contents of chamber buckets, ashes, the emptyings of garden houses, etc. This pile, with the addition once a month of from 10 to 20 loads of fresh earth or muck, makes a compost that cannot be beaten for corn. Then again, immense quantities of straw fodder and all other waste go through the stable and hog-pens into the barnyard. Any one would be surprised to find the amount that goes into it. When made *an object*, 250 loads can be made from farms of this size. I am again growing a piece of the Prolific Corn. I am still inclined to think it only prolific in fodder, and *efforts* to make ears. The little spikes stand on arms a foot to 18 inches from the stalk. The latter is large enough to make immense ears, but those on it are small. The grain is shallow, and instead of having a salable appearance in bulk, it has a trashy look, when compared with our fine varieties of white corn here. It is not the number of ears to a stalk that makes large yields. Corn planted 3 ft. 9 inches, or 4 ft. by 2½, with two stalks left in the hill, and each bearing a fair ear of 20 or 24 rows, makes a great deal of grain per acre. It is the number of stalks bearing ears that makes the crop. It is poor economy to leave three, four or five stalks of corn in a hill, no matter how rich the land. Peaches are now going from our Peninsula by every conveyance at small figures. T. B. B.

WEST VA., Bedington, Berkeley Co., Aug. 15.—Seeing so much said about Blount's Prolific corn in the columns of the RURAL, prompts me to say something about the progress of the package sent me. My corn is about 10 feet high and has from three to five ears on a stalk. It didn't come up very well from some cause, else I would have contested for a prize. The Pearl Millet has gone "where the woodbine twineth," and is a perfect failure. As to our crops generally, we have a very good crop of early potatoes. Wheat has not as good a growth of straw, but it has a better yield, of grain than last year, making a fair average crop of about 15 bushels to the acre. Oats are almost a failure—not exceeding 20 bushels to the acre, with only a small acreage sown. The fair season we have had since harvest, makes our corn crop quite prosperous indeed, and if the season continues favorable we shall have an extraordinary yield. Everything is in flourishing condition. A large crop of clover seed is expected. Timothy seed sells for $1.25; clover, $3.50; wheat, $1.05; corn 40c; oats, 25c; potatoes, 50c; butter, 15c; eggs, 8c. J. H. L.
